

2017

USP 40

**THE UNITED STATES PHARMACOPEIA**

NF 35

**THE NATIONAL FORMULARY**

**Volume 2-1**

*By authority of the United States Pharmacopeial Convention  
Prepared by the Council of Experts and its Expert Committees*

*Official from May 1, 2017*

The designation on the cover of this publication, "USP NF 2017," is for ease of identification only. The publication contains two separate compendia: *The United States Pharmacopeia*, Fortieth Revision, and *The National Formulary*, Thirty-Fifth Edition.

THE UNITED STATES PHARMACOPEIAL CONVENTION  
12601 Twinbrook Parkway, Rockville, MD 20852

## SIX-MONTH IMPLEMENTATION GUIDELINE

The *United States Pharmacopeia–National Formulary* and its supplements become official six months after being released to the public. The *USP–NF*, which is released on November 1 of each year, becomes official on May 1 of the following year. This six-month implementation timing gives users more time to bring their methods and procedures into compliance with new and revised *USP–NF* requirements.

The table below describes the official dates of the *USP–NF* and its supplements. The 2016 *USP 39–NF 34*, and its supplements, *Interim Revision Announcements (IRAs)* and *Revision Bulletins* to that edition, will be official until May 1, 2017, at which time the *USP 40–NF 35* becomes official.

Publication	Release Date	Official Date	Official Until
<i>USP 40–NF 35</i>	November 1, 2016	May 1, 2017	May 1, 2018 (except as superseded by supplements, <i>IRAs</i> , and <i>Revision Bulletins</i> )
<i>First Supplement to the USP 40–NF 35</i>	February 1, 2017	August 1, 2017	May 1, 2018 (except as superseded by <i>Second Supplement</i> , <i>IRAs</i> , and <i>Revision Bulletins</i> )
<i>Second Supplement to the USP 40–NF 35</i>	June 1, 2017	December 1, 2017	May 1, 2018 (except as superseded by <i>IRAs</i> and <i>Revision Bulletins</i> )
<i>USP 41–NF 36</i>	November 1, 2017	May 1, 2018	May 1, 2019 (except as superseded by supplements, <i>IRAs</i> , and <i>Revision Bulletins</i> )

The table below gives the details of the *IRAs* that will apply to *USP 40–NF 35*.

IRA	PF Posting Date	Comment Due Date	IRA Posting Date	IRA Official Date
42(1)	January 4, 2017	March 31, 2017	May 27, 2017	July 1, 2017
42(2)	March 1, 2017	May 31, 2017	July 29, 2017	September 1, 2017
42(3)	May 2, 2017	July 31, 2017	September 30, 2017	November 1, 2017
42(4)	July 1, 2017	September 30, 2017	November 25, 2017	January 1, 2018
42(5)	September 1, 2017	November 30, 2017	January 27, 2018	March 1, 2018
42(6)	November 1, 2017	January 31, 2018	March 31, 2018	May 1, 2018

*Revision Bulletins* published on the USP website become official on the date specified in the *Revision Bulletin*.

## NOTICE AND WARNING

**Concerning U.S. Patent or Trademark Rights**—The inclusion in *The United States Pharmacopeia* or in the *National Formulary* of a monograph on any drug in respect to which patent or trademark rights may exist shall not be deemed, and is not intended as, a grant of, or authority to exercise, any right or privilege protected by such patent or trademark. All such rights and privileges are vested in the patent or trademark owner, and no other person may exercise the same without express permission, authority, or license secured from such patent or trademark owner.

**Concerning Use of USP or NF Text**—Attention is called to the fact that *USP* and *NF* text is fully copyrighted. Authors and others wishing to use portions of the text should request permission to do so from the Secretary of the USPC Board of Trustees.

# Guide to General Chapters

(For complete alphabetical list of all general chapters in this Pharmacopeia, see under "General chapters" in the index.)

## GENERAL TESTS AND ASSAYS

### General Requirements for Tests and Assays

(1) Injections	67
(2) Oral Drug Products—Product Quality Tests	74
(3) Topical and Transdermal Drug Products—Product Quality Tests	78
(4) Mucosal Drug Products—Product Quality Tests	86
(5) Inhalation and Nasal Drug Products—General Information and Product Quality Tests	90
(7) Labeling	98
(11) USP Reference Standards	104

### Apparatus for Tests and Assays

(17) Prescription Container Labeling	107
(31) Volumetric Apparatus	110
(41) Balances	111

### Microbiological Tests

(51) Antimicrobial Effectiveness Testing	111
(55) Biological Indicators—Resistance Performance Tests	114
(61) Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests	117
(62) Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms	123
(63) Mycoplasma Tests	130
(71) Sterility Tests	136

### Biological Tests and Assays

(81) Antibiotics—Microbial Assays	143
(85) Bacterial Endotoxins Test	163
(87) Biological Reactivity Tests, In Vitro	169
(88) Biological Reactivity Tests, In Vivo	172
(89) Enzymes Used as Ancillary Materials in Pharmaceutical Manufacturing	177
(89.1) Collagenase I	180
(89.2) Collagenase II	185
(90) Fetal Bovine Serum—Quality Attributes and Functionality Tests	190
(91) Calcium Pantothenate Assay	193
(92) Growth Factors and Cytokines Used in Cell Therapy Manufacturing	195
(111) Design and Analysis of Biological Assays	199
(115) Dexpanthenol Assay	203
(121) Insulin Assays	205
(121.1) Physicochemical Analytical Procedures for Insulins	207
(123) Glucagon Bioidentity Tests	210
(124) Erythropoietin Bioassays	213
(126) Somatropin Bioidentity Tests	214

(127) Flow Cytometric Enumeration of CD34+ Cells	216
(129) Analytical Procedures for Recombinant Therapeutic Monoclonal Antibodies	221
(130) Protein A Quality Attributes	227
(151) Pyrogen Test	234
(161) Medical Devices—Bacterial Endotoxin and Pyrogen Tests	236
(162) Diphtheria Antitoxin Potency Testing for Human Immune Globulins	239
(165) Prekallikrein Activator	241
(171) Vitamin B <sub>12</sub> Activity Assay	242

## Chemical Tests and Assays

### Identification Tests

(181) Identification—Organic Nitrogenous Bases	245
(191) Identification Tests—General	245
(191) Identification Tests—General	251
(193) Identification—Tetracyclines	254
(197) Spectrophotometric Identification Tests	255
(201) Thin-Layer Chromatographic Identification Test	256
(202) Identification of Fixed Oils By Thin-Layer Chromatography	257
(203) High-Performance Thin-Layer Chromatography Procedure for Identification of Articles of Botanical Origin	258

### Limit Tests

(206) Aluminum	260
(207) Test for 1,6-Anhydro Derivative for Enoxaparin Sodium	261
(208) Anti-Factor Xa and Anti-Factor IIa Assays for Unfractionated and Low Molecular Weight Heparins	266
(209) Low Molecular Weight Heparin Molecular Weight Determinations	270
(211) Arsenic	272
(212) Oligosaccharide Analysis	273
(221) Chloride and Sulfate	287
(223) Dimethylaniline	287
(226) 4-Epi-anhydrotetracycline	288
(227) 4-Aminophenol in Acetaminophen-Containing Drug Products	288
(228) Ethylene Oxide and Dioxane	290
(231) Heavy Metals	293
(232) Elemental Impurities—Limits	295
(233) Elemental Impurities—Procedures	298
(241) Iron	301
(251) Lead	302
(261) Mercury	303
(267) Porosimetry by Mercury Intrusion	306
(268) Porosity by Nitrogen Adsorption-Desorption	309
(271) Readily Carbonizable Substances Test	314
(281) Residue on Ignition	314
(291) Selenium	315

afroozpharma@yahoo.com

## Other Tests and Assays

(301) Acid-Neutralizing Capacity	316
(311) Alginates Assay	317
(341) Antimicrobial Agents—Content	318
(345) Assay for Citric Acid/Citrate and Phosphate	323
(351) Assay for Steroids	324
(371) Cobalamin Radiotracer Assay	324
(381) Elastomeric Closures for Injections	326
(391) Epinephrine Assay	331
(401) Fats and Fixed Oils	332
(411) Folic Acid Assay	345
(413) Impurities Testing in Medical Gases	349
(415) Medical Gases Assay	349
(425) Iodometric Assay—Antibiotics	353
(429) Light Diffraction Measurement of Particle Size	354
(431) Methoxy Determination	359
(441) Niacin or Niacinamide Assay	361
(451) Nitrite Titration	366
(461) Nitrogen Determination	366
(466) Ordinary Impurities	368
(467) Residual Solvents	369
(469) Ethylene Glycol, Diethylene Glycol, and Triethylene Glycol in Ethoxylated Substances	384
(471) Oxygen Flask Combustion	385
(481) Riboflavin Assay	386
(501) Salts of Organic Nitrogenous Bases	392
(503) Acetic Acid in Peptides	393
(503.1) Trifluoroacetic Acid (TFA) in Peptides	394
(507) Protein Determination Procedures	395
(511) Single-Steroid Assay	400
(525) Sulfur Dioxide	401
(531) Thiamine Assay	407
(541) Titrimetry	416
(551) Vitamin E Assay	419
(561) Articles of Botanical Origin	426
(563) Identification of Articles of Botanical Origin	440
(565) Botanical Extracts	452
(571) Vitamin A Assay	454
(580) Vitamin C Assay	459
(581) Vitamin D Assay	462
(591) Zinc Determination	471

## Physical Tests and Determinations

(601) Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests	472
(602) Propellants	498
(603) Topical Aerosols	499
(604) Leak Rate	500
(610) Alternative Microbiological Sampling Methods for Nonsterile Inhaled and Nasal Products	501
(611) Alcohol Determination	503
(616) Bulk Density and Tapped Density of Powders	505
(621) Chromatography	508
(631) Color and Achromicity	520
(641) Completeness of Solution	521
(643) Total Organic Carbon	522
(645) Water Conductivity	523
(651) Congealing Temperature	527
(659) Packaging and Storage Requirements	529
(660) Containers—Glass	534
(661) Plastic Packaging Systems and Their Materials of Construction	541
(661.1) Plastic Materials of Construction	542
(661.2) Plastic Packaging Systems for Pharmaceutical Use	554
(670) Auxiliary Packaging Components	558
(671) Containers—Performance Testing	565
(691) Cotton	573
(695) Crystallinity	575

(696) Characterization of Crystalline Solids by Microcalorimetry and Solution Calorimetry	575
(697) Container Content for Injections	578
(698) Deliverable Volume	579
(699) Density of Solids	582
(701) Disintegration	584
(705) Quality Attributes of Tablets Labeled as Having a Functional Score	586
(711) Dissolution	588
(721) Distilling Range	598
(724) Drug Release	600
(729) Globule Size Distribution in Lipid Injectable Emulsions	607
(730) Plasma Spectrochemistry	611
(731) Loss on Drying	614
(733) Loss on Ignition	615
(735) X-Ray Fluorescence Spectrometry	615
(736) Mass Spectrometry	620
(741) Melting Range or Temperature	625
(755) Minimum Fill	628
(761) Nuclear Magnetic Resonance Spectroscopy	629
(771) Ophthalmic Products—Quality Tests	639
(776) Optical Microscopy	645
(781) Optical Rotation	648
(782) Vibrational Circular Dichroism Spectroscopy	649
(785) Osmolality and Osmolarity	656
(786) Particle Size Distribution Estimation by Analytical Sieving	658
(787) Subvisible Particulate Matter in Therapeutic Protein Injections	663
(788) Particulate Matter in Injections	665
(789) Particulate Matter in Ophthalmic Solutions	669
(790) Visible Particulates in Injections	671
(791) pH	672
(795) Pharmaceutical Compounding—Nonsterile Preparations	675
(797) Pharmaceutical Compounding—Sterile Preparations	683
(800) Hazardous Drugs—Handling in Healthcare Settings	727
(801) Polarography	746
(811) Powder Fineness	750
(821) Radioactivity	751
(823) Positron Emission Tomography	
Drugs for Compounding, Investigational, and Research Uses	758
(831) Refractive Index	768
(841) Specific Gravity	768
(846) Specific Surface Area	769
(852) Atomic Absorption Spectroscopy	773
(853) Fluorescence Spectroscopy	777
(854) Mid-Infrared Spectroscopy	783
(855) Nephelometry, Turbidimetry, and Visual Comparison	787
(857) Ultraviolet-Visible Spectroscopy	789
(861) Sutures—Diameter	795
(871) Sutures—Needle Attachment	796
(881) Tensile Strength	797
(891) Thermal Analysis	798
(905) Uniformity of Dosage Units	802
(911) Viscosity—Capillary Methods	806
(912) Viscosity—Rotational Methods	808
(913) Viscosity—Rolling Ball Method	812
(914) Viscosity—Pressure Driven Methods	814
(921) Water Determination	815
(941) Characterization of Crystalline and Partially Crystalline Solids by X-Ray Powder Diffraction (XRPD)	820

# GENERAL NOTICES AND REQUIREMENTS

The *General Notices and Requirements* section (the *General Notices*) presents the basic assumptions, definitions, and default conditions for the interpretation and application of the *United States Pharmacopeia* (USP) and the *National Formulary* (NF).

Requirements stated in these *General Notices* apply to all articles recognized in the USP and NF (the "compendia") and to all general chapters unless specifically stated otherwise.

## 1. TITLE AND REVISION

The full title of this publication (consisting of four volumes and including its *Supplements*), is *The Pharmacopeia of the United States of America*, Fortieth Revision and the *National Formulary*, Thirty-Fifth Edition. These titles may be abbreviated to USP 40, to NF 35, and to USP 40–NF 35. The *United States Pharmacopeia*, Fortieth Revision, and the *National Formulary*, Thirty-Fifth Edition, supersede all earlier revisions. Where the terms "USP," "NF," or "USP–NF" are used without further qualification during the period in which these compendia are official, they refer only to USP 40, NF 35, and any *Supplement(s)* thereto. The same titles, with no further distinction, apply equally to print or electronic presentation of these contents. Although USP and NF are published under one cover and share these *General Notices*, they are separate compendia.

This revision is official beginning May 1, 2017 unless otherwise indicated in specific text.

*Supplements* to USP and NF are published periodically.

Accelerated Revisions, published periodically on the *Official Text* section of USP's website (<http://www.usp.org/usp-nf/official-text>), are designed to make revisions official more quickly than through the routine process for publishing standards in the USP–NF. *Interim Revision Announcements* are Accelerated Revisions to USP and NF that contain official revisions and their effective dates.

*Revision Bulletins* are Accelerated Revisions to official text or postponements that require expedited publication. They generally are official immediately unless otherwise specified in the *Revision Bulletin*.

*Errata* are Accelerated Revisions representing corrections to items erroneously published. Announcements of the availability of new USP Reference Standards and announcements of tests or procedures that are held in abeyance pending availability of required USP Reference Standards are also available on the "Official Text" tab of USP's website.

## 2. OFFICIAL STATUS AND LEGAL RECOGNITION

### 2.10. Official Text

Official text of the USP and NF is published in the USP–NF Online ([www.uspnf.com](http://www.uspnf.com)) in the edition identified as "CURRENTLY OFFICIAL" and in Accelerated Revisions that supersede the USP–NF Online as described below.

Routine revisions are published in the USP–NF Online and become official on the date indicated, usually six months after publication. Accelerated Revisions supersede the USP–NF Online and become official on the date indicated. Links to Accelerated Revisions on the USP website can be found in any superseded monograph or general chapter in the USP–NF Online.

Print and USB flash drive versions of the USP and NF also are available. Routine revisions are provided with the same timing as the USP–NF Online. Official text published in *Supplements* supersedes that in the previously published print or

USB flash drive versions of USP–NF. These versions also are superseded by Accelerated Revisions as described above.

In the event of any disparity between the print or USB flash drive versions and the USP–NF Online, the USP–NF Online will be deemed to apply.

### 2.20. Official Articles

An *official article* is an article that is recognized in USP or NF. An article is deemed to be recognized and included in a compendium when a monograph for the article is published in the compendium and an official date is generally or specifically assigned to the monograph.

The title specified in a monograph is the *official title* for such article. Other names considered to be synonyms of the official titles may not be used as substitutes for official titles.

*Official articles* include both *official substances* and *official products*. An *official substance* is a drug substance, excipient, dietary ingredient, other ingredient, or component of a finished device for which the monograph title includes no indication of the nature of the finished form.

An *official product* is a drug product, dietary supplement, compounded preparation, or finished device for which a monograph is provided.

### 2.30. Legal Recognition

The USP and NF are recognized in the laws and regulations of many countries throughout the world. Regulatory authorities may enforce the standards presented in the USP and NF, but because recognition of the USP and NF may vary by country, users should understand applicable laws and regulations. In the United States under the Federal Food, Drug, and Cosmetic Act (FDCA), both USP and NF are recognized as official compendia. A drug with a name recognized in USP–NF must comply with compendial identity standards or be deemed adulterated, misbranded, or both. See, e.g., FDCA § 501(b) and 502(e)(3)(b); also FDA regulations, 21 CFR § 299.5(a&b). To avoid being deemed adulterated, such drugs must also comply with compendial standards for strength, quality, and purity, unless labeled to show all respects in which the drug differs. See, e.g., FDCA § 501(b) and 21 CFR § 299.5(c). In addition, to avoid being deemed misbranded, drugs recognized in USP–NF must also be packaged and labeled in compliance with compendial standards. See FDCA § 502(g).

A dietary supplement represented as conforming to specifications in USP will be deemed a misbranded food if it fails to so conform. See FDCA § 403(s)(2)(D).

Enforcement of USP standards is the responsibility of FDA and other government authorities in the U.S. and elsewhere. USP has no role in enforcement.

### Change to read:

## 3. CONFORMANCE TO STANDARDS

### 3.10. Applicability of Standards

Standards for an article recognized in the compendia (USP–NF) are expressed in the article's monograph, applicable general chapters, and *General Notices*. The identity, strength, quality, and purity of an article are determined by the official tests, procedures, and acceptance criteria, and other requirements incorporated in the monograph, in applicable general chapters, or in the *General Notices*. "Applicable general chapters" means general chapters numbered

afroozpharma@yahoo.com

below 1000 or above 2000 that are made applicable to an article through reference in *General Notices*, a monograph, or another applicable general chapter numbered below 1000. Where the requirements of a monograph differ from the requirements specified in these *General Notices* or an applicable general chapter, the monograph requirements apply and supersede the requirements of the *General Notices* or applicable general chapters, whether or not the monograph explicitly states the difference.

General chapters numbered 1000 to 1999 are for informational purposes only. They contain no mandatory tests, assays, or other requirements applicable to any official article, regardless of citation in a general chapter numbered below 1000, a monograph, or these *General Notices*. General chapters numbered above 2000 apply only to articles that are intended for use as dietary ingredients and dietary supplements. General chapter citations in *NF* monographs refer to *USP* general chapters.

Early adoption of revised standards in advance of the official date is allowed by *USP* unless specified otherwise at the time of publication. Where revised standards for an existing article have been published as final approved "official text" (as approved in section 2.10 *Official Text*) but have not yet reached the official date (six months after publication, unless otherwise specified; see "official date", section 2.20 *Official Articles*), compliance with the revised standard shall not preclude a finding or indication of conformance with compendial standards, unless *USP* specifies otherwise by prohibiting early adoption in a particular standard.

The standards in the relevant monograph, general chapter(s), and *General Notices* apply at all times in the life of the article from production to expiration. It is also noted that the manufacturer's specifications, and manufacturing practices (e.g., Quality by Design, Process Analytical Technology, and Real Time Release Testing initiatives), generally are followed to ensure that the article will comply with compendial standards until its expiration date, when stored as directed. Every compendial article in commerce shall be so constituted that when examined in accordance with these assays and test procedures, it meets all applicable pharmacopeial requirements (*General Notices*, monographs, and general chapters). Thus, any official article is expected to meet the compendial standards if tested, and any official article actually tested as directed in the relevant monograph must meet such standards to demonstrate compliance.

Some tests, such as those for Dissolution and Uniformity of Dosage Units, require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact one determination. These procedures should not be confused with statistical sampling plans. The similarity to statistical procedures may seem to suggest an intent to make inference to some larger group of units, but in all cases, statements about whether the compendial standard is met apply only to the units tested. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations, as well as the necessity and appropriate frequency of batch testing, are neither specified nor proscribed by the compendia; such decisions are based on the objectives of the testing. Frequency of testing and sampling are left to the preferences or direction of those performing compliance testing, and other users of *USP-NF*, including manufacturers, buyers, or regulatory authorities.

Official products are prepared according to recognized principles of good manufacturing practice and from ingredi-

ents that meet *USP* or *NF* standards, where standards for such ingredients exist (for dietary supplements, see section 3.10.20).

Official substances are prepared according to recognized principles of good manufacturing practice and from ingredients complying with specifications designed to ensure that the resultant substances meet the requirements of the compendial monographs.

### 3.10.10. Applicability of Standards to Drug Products, Drug Substances, and Excipients

The applicable *USP* or *NF* standard applies to any article marketed in the United States that (1) is recognized in the compendium and (2) is intended or labeled for use as a drug or as an ingredient in a drug. Such articles (drug products, drug substances, and excipients) include both human drugs (whether dispensed by prescription, "over the counter," or otherwise), as well as animal drugs. The applicable standard applies to such articles whether or not the added designation "*USP*" or "*NF*" is used. The standards apply equally to articles bearing the official titles or names derived by transposition of the definitive words of official titles or transposition in the order of the names of two or more active ingredients in official titles, or where there is use of synonyms with the intent or effect of suggesting a significant degree of identity with the official title or name.

### 3.10.20. Applicability of Standards to Medical Devices, Dietary Supplements, and Their Components and Ingredients

An article recognized in *USP* or *NF* shall comply with the compendial standards if the article is a medical device, component intended for a medical device, dietary supplement, dietary ingredient, or other ingredient that is intended for incorporation into a dietary supplement, and is labeled as conforming to the *USP* or *NF*.

Generally, dietary supplements are prepared from ingredients that meet *USP*, *NF*, or *Food Chemicals Codex* standards. Where such standards do not exist, substances may be used in dietary supplements if they have been shown to be of acceptable food grade quality using other suitable procedures.

### 3.10.30. Applicability of Standards to the Practice of Compounding (New)

*USP* compounding practice standards, *Pharmaceutical Compounding—Nonsterile Preparations* (795) and *Pharmaceutical Compounding—Sterile Preparations* (797), as appropriate, apply to compounding practice or activity regardless of whether a monograph exists for the compounded preparation or these chapters are referenced in such a monograph. In the United States, (795) and (797) are not applicable to drugs compounded by entities registered with FDA as outsourcing facilities as defined by FDCA § 503B, because such facilities are required to comply with FDA's current good manufacturing practice requirements. Compounded preparations, including drug products compounded by outsourcing facilities, may also be subject to applicable monographs; see section 2.20 *Official Articles* and section 4.10 *Monographs*. ▲*USP40*

### 3.20. Indicating Conformance

A drug product, drug substance, or excipient may use the designation "*USP*" or "*NF*" in conjunction with its official title or elsewhere on the label only when (1) a monograph

afroozpharma@yahoo.com

is provided in the specified compendium and (2) the article complies with the identity prescribed in the specified compendium.

When a drug product, drug substance, compounded preparation, or excipient differs from the relevant *USP* or *NF* standard of strength, quality, or purity, as determined by the application of the tests, procedures, and acceptance criteria set forth in the relevant compendium, its difference shall be plainly stated on its label.

When a drug product, drug substance, compounded preparation, or excipient fails to comply with the identity prescribed in *USP* or *NF* or contains an added substance that interferes with the prescribed tests and procedures, the article shall be designated by a name that is clearly distinguishing and differentiating from any name recognized in *USP* or *NF*.

A medical device, dietary supplement, or ingredient or component of a medical device or dietary supplement may use the designation "USP" or "NF" in conjunction with its official title or elsewhere on the label only when (1) a monograph is provided in the specified compendium and (2) the article complies with the monograph standards and other applicable standards in that compendium.

The designation "USP" or "NF" on the label may not and does not constitute an endorsement by USP and does not represent assurance by USP that the article is known to comply with the relevant standards. USP may seek legal redress if an article purports to be or is represented as an official article in one of USP's compendia and such claim is determined by USP not to be made in good faith.

The designation "USP-NF" may be used on the label of an article provided that the label also bears a statement such as "Meets NF standards as published by USP," indicating the particular compendium to which the article purports to apply.

When the letters "USP," "NF," or "USP-NF" are used on the label of an article to indicate compliance with compendial standards, the letters shall appear in conjunction with the official title of the article. The letters are not to be enclosed in any symbol such as a circle, square, etc., and shall appear in capital letters.

If a dietary supplement does not comply with all applicable compendial requirements but contains one or more dietary ingredients or other ingredients that are recognized in *USP* or *NF*, the individual ingredient(s) may be designated as complying with *USP* or *NF* standards or being of *USP* or *NF* quality provided that the designation is limited to the individual ingredient(s) and does not suggest that the dietary supplement complies with *USP* standards.

#### 4. MONOGRAPHS AND GENERAL CHAPTERS

##### 4.10. Monographs

Monographs set forth the article's name, definition, specification, and other requirements related to packaging, storage, and labeling. The specification consists of tests, procedures, and acceptance criteria that help ensure the identity, strength, quality, and purity of the article. For general requirements relating to specific monograph sections, see section 5 *Monograph Components*.

Because monographs may not provide standards for all relevant characteristics, some official substances may conform to the *USP* or *NF* standard but differ with regard to nonstandardized properties that are relevant to their use in specific preparations. To assure substitutability in such instances, users may wish to ascertain functional equivalence or determine such characteristics before use.

##### 4.10.10. Applicability of Test Procedures

A single monograph may include more than one test, procedure, and/or acceptance criterion for the same attribute. Unless otherwise specified in the monograph, all tests are requirements. In some cases, monograph instructions allow the selection of tests that reflect attributes of different manufacturers' articles, such as different polymorphic forms, impurities, hydrates, and dissolution. Monograph instructions

indicate the tests, procedures, and/or acceptance criteria to be used and the required labeling.

The order in which the tests are listed in the monograph is based on the order in which they are approved by the relevant Expert Committee for inclusion in the monograph. Test 1 is not necessarily the test for the innovator or for the reference product. Depending on monograph instructions, a labeling statement is not typically required if Test 1 is used.

##### 4.10.20. Acceptance Criteria

The acceptance criteria allow for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions. The existence of compendial acceptance criteria does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" compendial quality. Similarly, the fact that an article has been prepared to tighter criteria than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the compendial requirements.

An official product shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label. Where the minimum amount of a substance present in a dietary supplement is required by law to be higher than the lower acceptance criterion allowed for in the monograph, the upper acceptance criterion contained in the monograph may be increased by a corresponding amount.

The acceptance criteria specified in individual monographs and in the general chapters for compounded preparations are based on such attributes of quality as might be expected to characterize an article compounded from suitable bulk drug substances and ingredients, using the procedures provided or recognized principles of good compounding practice, as described in these compendia.

##### 4.20. General Chapters

Each general chapter is assigned a number that appears in angle brackets adjacent to the chapter name (e.g., *Chromatography* (621)). General chapters may contain the following:

- Descriptions of tests and procedures for application through individual monographs,
- Descriptions and specifications of conditions and practices for pharmaceutical compounding,
- General information for the interpretation of the compendial requirements,
- Descriptions of general pharmaceutical storage, dispensing, and packaging practices, or
- General guidance to manufacturers of official substances or official products.

When a general chapter is referenced in a monograph, acceptance criteria may be presented after a colon.

Some chapters may serve as introductory overviews of a test or of analytical techniques. They may reference other general chapters that contain techniques, details of the procedures, and, at times, acceptance criteria.

#### Change to read:

#### 5. MONOGRAPH COMPONENTS

##### 5.10. Molecular Formula

The use of the molecular formula for the active ingredient(s) named in defining the required strength of a compendial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute (100 percent) purity.

##### 5.20. Added Substances

Added substances are presumed to be unsuitable for inclusion in an official article and therefore prohibited, if their presence impairs the bioavailability, therapeutic efficacy, or safety of the official article; or they interfere with the assays and tests prescribed for determining compliance with the

afroozpharma@yahoo.com

compendial standards (see section 3.20 *Indicating Conformance*).

The air in a container of an official article may, where appropriate, be evacuated or be replaced by carbon dioxide, helium, argon, or nitrogen, or by a mixture of these gases. The use of such gas need not be declared in the labeling.

#### 5.20.10. Added Substances in Official Substances

Official substances may contain only the specific added substances that are permitted by the individual monograph. Such added substances shall not exceed the quantity required for providing their intended effect. Where such addition is permitted, the label shall indicate the name(s) and amount(s) of any added substance(s).

#### 5.20.20. Added Substances (Excipients and Ingredients) in Official Products

Suitable substances and excipients such as antimicrobial agents, pharmaceutical bases, carriers, coatings, flavors, preservatives, stabilizers, and vehicles may be added to an official product to enhance its stability, usefulness, or elegance, or to facilitate its preparation, unless otherwise specified in the individual monograph.

Added substances and excipients employed solely to impart color may be incorporated into official products other than those intended for parenteral or ophthalmic use, in accordance with the regulations pertaining to the use of colors issued by the U.S. Food and Drug Administration (FDA), provided such added substances or excipients are otherwise appropriate in all respects. (See also *Injectables and Implanted Drugs Products (1)*, *Product Quality Tests Common to Parenteral Dosage Forms, Specific Tests, Vehicles and added substances*, *Added substances*.) USP40

The proportions of the substances constituting the base in ointment and suppository products and preparations may be varied to maintain a suitable consistency under different climatic conditions, provided that the concentrations of active ingredients are not varied and provided that the bioavailability, therapeutic efficacy, and safety of the preparation are not impaired.

#### 5.20.20.1. In Compounded Preparations

Compounded preparations for which a complete composition is given shall contain only the ingredients named in the formulas unless specifically exempted herein or in the individual monograph. Deviation from the specified processes or methods of compounding, although not from the ingredients or proportions thereof, may occur provided that the finished preparation conforms to the relevant standards and to preparations produced by following the specified process.

Where a monograph for a compounded preparation calls for an ingredient in an amount expressed on the dried basis, the ingredient need not be dried before use if due allowance is made for the water or other volatile substances present in the quantity taken.

Specially denatured alcohol formulas are available for use in accordance with federal statutes and regulations of the Internal Revenue Service. A suitable formula of specially denatured alcohol may be substituted for Alcohol in the manufacture of official preparations intended for internal or topical use, provided that the denaturant is volatile and does not remain in the finished product. A preparation that is intended for topical application to the skin may contain specially denatured alcohol, provided that the denaturant is either a usual ingredient in the preparation or a permissible added substance; in either case the denaturant shall be identified on the label of the topical preparation. Where a process is given in the individual monograph, any preparation compounded using denatured alcohol shall be identical to that prepared by the monograph process.

#### 5.20.20.2. In Dietary Supplements

Additional ingredients may be added to dietary supplement products provided that the additional ingredients: (1) comply with applicable regulatory requirements; and (2) do

not interfere with the assays and tests prescribed for determining compliance with compendial standards.

#### 5.30. Description and Solubility

Only where a quantitative solubility test is given in a monograph and is designated as such is it a test for purity.

A monograph may include information regarding the article's description. Information about an article's "description and solubility" also is provided in the reference table *Description and Relative Solubility of USP and NF Articles*. The reference table merely denotes the properties of articles that comply with monograph standards. The reference table is intended primarily for those who use, prepare, and dispense drugs and/or related articles. Although the information provided in monographs and the information in the reference table may indirectly assist in the preliminary evaluation of an article, it is not intended to serve as a standard or test for purity.

The approximate solubility of a compendial substance is indicated by one of the following descriptive terms:

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1,000
Very slightly soluble	From 1,000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

#### 5.40. Identity

A compendial test titled *Identity* or *Identification* is provided as an aid in verifying the identity of articles as they are purported to be, e.g., those taken from labeled containers, and to establish whether it is the article named in *USP-NF*. The *Identity* or *Identification* test for a particular article may consist of one or more procedures. When a compendial test for *Identity* or *Identification* is undertaken, all requirements of all specified procedures in the test must be met to satisfy the requirements of the test. Failure of an article to meet all the requirements of a prescribed *Identity* or *Identification* test (i.e., failure to meet the requirements of all of the specified procedures that are components of that test) indicates that the article is mislabeled and/or adulterated.

#### 5.50. Assay

Assay tests for compounded preparations are not intended for evaluating a compounded preparation before dispensing, but instead are intended to serve as the official test in the event of a question or dispute regarding the preparation's conformance to official standards.

#### 5.50.10. Units of Potency (Biological)

For substances that cannot be completely characterized by chemical or physical means or that need confirmation of functionality or tertiary structure, it may be necessary to express quantities of biological activity in units of biological potency, each defined by an authoritative, designated reference standard. In cases where international reference materials have been discontinued, international units of potency may be defined in terms of molecular mass, such as in the cases of vitamins A, D, and E.

Where available, World Health Organization (WHO) international biological standards define the International Units (IU). *USP* monographs refer to the units assigned by *USP Reference Standards* either directly as International Units (IU) or as "USP Units." For some biological products, units of potency are value assigned against a corresponding U.S. Standard established by FDA, whether or not International Units or USP Units have been defined (see *Biologics* (1041)). Note that product-related labeling, e.g., on containers, need not use the full phrase "USP [product name] Units" that

afroozpharma@yahoo.com

appears in many USP monograph labeling sections. The term "USP Units" can be used on product labeling consistent with USP compendial requirements, provided it is clear from the context that the volume is stated in terms of USP [product name] Units. In such circumstances it should be clear that "USP Units" and "USP [product name] Units" share the same meaning.

#### 5.60. Impurities and Foreign Substances

Tests for the presence of impurities and foreign substances are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Drug Substances and Drug Products* (1086)).

Nonmonograph tests and acceptance criteria suitable for detecting and controlling impurities that may result from a change in the processing methods or that may be introduced from external sources should be employed in addition to the tests provided in the individual monograph, where the presence of the impurity is inconsistent with applicable good manufacturing practices or good pharmaceutical practices.

#### 5.60.10. Other Impurities in USP and NF Articles

If a USP or NF monograph includes an assay or organic impurity test based on chromatography, other than a test for residual solvents, and that monograph procedure does not detect an impurity present in the substance, the amount and identity of the impurity, where both are known, shall be stated in the labeling (certificate of analysis) of the official substance, under the heading *Other Impurity(ies)*.

The presence of any unlabeled other impurity in an official substance is a variance from the standard if the content is 0.1% or greater. The sum of all *Other Impurities* combined with the monograph-detected impurities may not exceed 2.0% (see *Ordinary Impurities* (466)), unless otherwise stated in the monograph.

The following categories of drug substances are excluded from *Other Impurities* requirements:

- Fermentation products and semi-synthetics derived therefrom,
- Radiopharmaceuticals,
- Biologics,
- Biotechnology-derived products,
- Peptides,
- Herbals, and
- Crude products of animal or plant origin.

Any substance known to be toxic shall not be listed under *Other Impurities*.

#### 5.60.20. Residual Solvents in USP and NF Articles

All USP and NF articles are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. If solvents are used during production, they must be of suitable quality. In addition, the toxicity and residual level of each solvent shall be taken into consideration, and the solvents limited according to the principles defined and the requirements specified in *Residual Solvents* (467), using the general methods presented therein or other suitable methods.

#### 5.60.30. Elemental Impurities in USP Drug Products and Dietary Supplements

Effective January 1, 2018, elemental impurities will be controlled in official drug products according to the principles defined and requirements specified in *Elemental Impurities—Limits* (232). Effective January 1, 2018, elemental contaminants are controlled in official dietary supplements according to the principles defined and requirements specified in *Elemental Contaminants in Dietary Supplements* (2232). Also effective January 1, 2018, *Heavy Metals* (231) will be omitted and all references to it in general chapters and monographs will be deleted. Early adoption of the requirements in (232) and (2232) are permitted by USP, and if (232) or (2232), as applicable, is fully implemented with respect to a particular drug product or dietary supplement in advance of the January 1, 2018 date, that product and its ingredients will no longer need to comply with applicable

(231) requirements to be considered by USP to be in conformance with USP–NF requirements.

#### 5.70. Performance Tests

Where content uniformity determinations have been made using the same analytical methodology specified in the Assay, with appropriate allowances made for differences in sample preparation, the average of all of the individual content uniformity determinations may be used as the Assay value.

#### 5.80. USP Reference Standards

USP Reference Standards are authentic specimens that have been approved as suitable for use as comparison standards in USP or NF tests and assays. (See *USP Reference Standards* (11).) Where USP or NF tests or assays call for the use of a USP Reference Standard, only those results obtained using the specified USP Reference Standard are conclusive. Where a procedure calls for the use of a compendial article rather than for a USP Reference Standard as a material standard of reference, a substance meeting all of the compendial monograph requirements for that article shall be used. If any new USP or NF standard requires the use of a new USP Reference Standard that is not yet available, that portion of the standard containing the requirement shall not be official until the specified USP reference material is available.

Unless a Reference Standard label bears a specific potency or content, assume the Reference Standard is 100.0% pure in the official application. Unless otherwise directed in the procedure in the individual monograph or in a general chapter, USP Reference Standards are to be used in accordance with the instructions on the label of the Reference Standard.

#### Change to read:

### 6. TESTING PRACTICES AND PROCEDURES

#### 6.10. Safe Laboratory Practices

In performing compendial procedures, safe laboratory practices shall be followed, including precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures used. Before undertaking any procedure described in the compendia, the analyst should be aware of the hazards associated with the chemicals and the techniques and means of protecting against them. These compendia are not designed to describe such hazards or protective measures.

#### 6.20. Automated Procedures

Automated and manual procedures employing the same basic chemistry are considered equivalent.

#### 6.30. Alternative and Harmonized Methods and Procedures

Alternative methods and/or procedures may be used if they provide advantages in terms of accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction, or in other special circumstances. Such alternative procedures and methods shall be validated as described in *Validation of Compendial Procedures* (1225) and must be shown to give equivalent or better results. Only those results obtained by the methods and procedures given in the *compendia* are conclusive.

Alternative procedures should be submitted to USP for evaluation as a potential replacement or addition to the standard (see section 4.10 *Monographs*).

Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method or procedure from one of these pharmacopoeias, it should comply with the requirements of the USP–NF. When a difference appears, or in the event of dispute, only the result obtained by the method and/or procedure given in the USP–NF is conclusive.

afroozpharma@yahoo.com

**6.40. Dried, Anhydrous, Ignited, or Solvent-Free Basis**

All calculations in the compendia assume an "as-is" basis unless otherwise specified.

Test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on Drying*, or *Water Determination*, or *Loss on Ignition*, respectively, is given in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

The term "solvent-free" signifies that the calculation shall be corrected for the presence of known solvents as determined using the methods described in (467) unless a test for limit of organic solvents is provided in the monograph.

The term "previously dried" without qualification signifies that the substance shall be dried as directed under *Loss on Drying* (731) or *Water Determination* (921) (gravimetric determination).

Where drying in vacuum over a desiccant is directed, a vacuum desiccator, a vacuum drying pistol, or other suitable vacuum drying apparatus shall be used.

**6.40.10. Ignite to Constant Weight**

"Ignite to constant weight" means that ignition shall be continued at  $800 \pm 25^\circ$ , unless otherwise indicated, until two consecutive weighings, the second of which is taken after an additional period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

**6.40.20. Dried to Constant Weight**

"Dried to constant weight" means that drying shall be continued until two consecutive weighings, the second of which is taken after an additional drying period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

**6.50. Preparation of Solutions****6.50.10. Filtration**

Where a procedure gives direction to "filter" without further qualification, the liquid shall be passed through suitable filter paper or equivalent device until the filtrate is clear. Due to the possibility of filter effects, the initial volumes of a filtrate may be discarded.

**6.50.20. Solutions**

Unless otherwise specified, all solutions shall be prepared with Purified Water. Solutions for quantitative measures shall be prepared using accurately weighed or accurately measured analytes (see section 8.20 *About*).

An expression such as "(1 in 10)" means that 1 part by volume of a liquid shall be diluted with, or 1 part by weight of a solid shall be dissolved in, a sufficient quantity of the diluent or solvent to make the volume of the finished solution 10 parts by volume. An expression such as "(20:5:2)" means that the respective numbers of parts, by volume, of the designated liquids shall be mixed, unless otherwise indicated.

**6.50.20.1. Adjustments to Solutions**

When a specified concentration is called for in a procedure, a solution of other normality or molarity may be used, provided that allowance is made for the difference in concentration and that the change does not increase the error of measurement.

Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy.

Unless otherwise indicated, analyte concentrations shall be prepared to within ten percent (10%) of the indicated value. In the case in which a procedure is adapted to the working range of an instrument, solution concentrations may differ from the indicated value by more than ten percent (10%), with appropriate changes in associated calculations. Any changes shall fall within the validated range of the instrument.

When adjustment of pH is indicated with either an acid or base and the concentration is not indicated, appropriate concentrations of that acid or base may be used.

**6.50.20.2. Test Solutions**

Information on Test Solutions (TS) is provided in the *Test Solutions* portion of the *Reagents, Indicators, and Solutions* section of the *USP-NF*. Use of an alternative Test Solution or a change in the Test Solution used may require validation.

**6.50.20.3. Indicator Solutions**

Where a procedure specifies the use of an indicator TS, approximately 0.2 mL, or 3 drops, of the solution shall be added unless otherwise directed.

**6.60. Units Necessary to Complete a Test**

Unless otherwise specified, a sufficient number of units to ensure a suitable analytical result shall be taken.

**6.60.10. Tablets**

Where the procedure of a Tablet monograph directs to weigh and finely powder not fewer than a given number of Tablets, a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered Tablets taken shall be representative of the whole Tablets and shall, in turn, be weighed accurately.

**6.60.20. Capsules**

Where the procedure of a Capsule monograph gives direction to remove, as completely as possible, the contents of not fewer than a given number of the Capsules, a counted number of Capsules shall be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken shall be representative of the contents of the Capsules and shall, in turn, be weighed accurately.

**6.70. Reagents**

The proper conduct of the compendial procedures and the reliability of the results depend, in part, upon the quality of the reagents used in the performance of the procedures. Unless otherwise specified, reagents conforming to the specifications set forth in the current edition of *Reagent Chemicals* published by the American Chemical Society (ACS) shall be used. Where such ACS reagent specifications are not available or where the required purity differs, compendial specifications for reagents of acceptable quality are provided (see the *Reagents, Indicators, and Solutions* section of the *USP-NF*). Reagents not covered by any of these specifications should be of a grade suitable to the proper performance of the method of assay or test involved.

Listing of these reagents, including the indicators and solutions employed as reagents, in no way implies that they have therapeutic utility; furthermore, any reference to *USP* or *NF* in their labeling shall include also the term "reagent" or "reagent grade." *USP* may supply reagents if they otherwise may not be generally commercially available.

**6.80. Equipment**

Unless otherwise specified, a specification for a definite size or type of container or apparatus in a procedure is given solely as a recommendation. Other dimensions or types may be used if they are suitable for the intended use.

**6.80.10. Apparatus for Measurement**

Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed.

**6.80.10.1. Pipet/Pipette**

Where a pipet/pipette is specified, a suitable buret may be substituted. Where a "to contain" pipet/pipette is specified, a suitable volumetric flask may be substituted.

**6.80.10.2. Light Protection**

Where low-actinic or light-resistant containers are specified, either containers specially treated to protect contents from light or clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

afroozpharma@yahoo.com

**6.80.20. Instrumental Apparatus**

An instrument may be substituted for the specified instrument if the substitute uses the same fundamental principles of operation and is of equivalent or greater sensitivity and accuracy. These characteristics shall be qualified as appropriate. Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification.

**6.80.20.1. Chromatographic Tubes and Columns**

The term "diameter" refers to internal diameter (ID).

**6.80.20.2. Tubing**

The term "diameter" refers to outside diameter (OD).

**6.80.20.3. Steam Bath**

Where use of a steam bath is directed, use actively flowing steam or another regulated heat source controlled at an equivalent temperature.

**6.80.20.4. Water Bath**

A water bath requires vigorously boiling water unless otherwise specified.

**6.80.30. Temperature Reading Devices**

Temperature reading devices suitable for pharmacopeial tests conform to specifications that are traceable to a National Institute of Standards and Technology (NIST) standard or equivalent. Temperature reading devices may be of the liquid-in-glass type or an analog or digital temperature indicator type, such as a resistance temperature device, thermistor, or thermocouple. Standardization of thermometers is performed on an established testing frequency with a temperature standard traceable to NIST. For example, refer to the current issue of American Society of Testing and Materials (ASTM) standards E1 for liquid-in-glass thermometers.

**7. TEST RESULTS****7.10. Interpretation of Requirements**

Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated acceptance criteria to determine whether the article conforms to compendial requirements.

The reportable value, which often is a summary value for several individual determinations, is compared with the acceptance criteria. The reportable value is the end result of a completed measurement procedure, as documented.

Where acceptance criteria are expressed numerically herein through specification of an upper and/or lower limit, permitted values include the specified values themselves, but no values outside the limit(s). Acceptance criteria are considered significant to the last digit shown.

**7.10.5. Nominal Concentrations in Equations**

Where a "nominal concentration" is specified, calculate the concentration based on the label claim. In assay procedures, water correction is typically stated in the Definition

and on the label of the USP Reference Standard. For other procedures, correction for assayed content, potency, or both is made prior to using the concentration in the equation provided in the monograph.

**7.10.10. Equivalence Statements in Titrimetric Procedures**

The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, the number of significant figures in the concentration of the titrant should be understood to correspond to the number of significant figures in the weight of the analyte. Corrections to calculations based on the blank determination are to be made for all titrimetric assays where appropriate (see *Titrimetry* (541)).

**7.20. Rounding Rules**

The observed or calculated values shall be rounded off to the number of decimal places that is in agreement with the limit expression. Numbers should not be rounded until the final calculations for the reportable value have been completed. Intermediate calculations (e.g., slope for linearity) may be rounded for reporting purposes, but the original (not rounded) value should be used for any additional required calculations. Acceptance criteria are fixed numbers and are not rounded.

When rounding is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5, it is eliminated and the preceding digit is unchanged. If this digit is equal to or greater than 5, it is eliminated and the preceding digit is increased by 1.

**Change to read:** *When rounding is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5, it is eliminated and the preceding digit is unchanged. If this digit is equal to or greater than 5, it is eliminated and the preceding digit is increased by 1.*

**8. TERMS AND DEFINITIONS****8.10. Abbreviations**

- RS refers to a USP Reference Standard.
- CS refers to a Colorimetric Solution.
- TS refers to a Test Solution.
- VS refers to a Volumetric Solution that is standardized in accordance with directions given in the individual monograph or in the *Reagents, Indicators, and Solutions* section of USP-NF.

**8.20. About**

"About" indicates a quantity within 10%.

If the measurement is stated to be "accurately measured" or "accurately weighed," follow the statements in *Volumetric Apparatus* (31) and *Balances* (41), respectively.

**8.30. Alcohol Content**

Percentages of alcohol, such as those under the heading *Alcohol Content*, refer to percentage by volume of  $C_2H_5OH$  at 15.56°. Where a formula, test, or assay calls for alcohol, ethyl alcohol, or ethanol, the USP monograph article Alcohol

**Illustration of Rounding Numerical Values  
for Comparison with Requirements**

Compendial Requirement	Unrounded Value	Rounded Result	Conforms
Assay limit $\geq 98.0\%$	97.96%	98.0%	Yes
	97.92%	97.9%	No
	97.95%	98.0%	Yes
Assay limit $\leq 101.5\%$	101.55%	101.6%	No
	101.46%	101.5%	Yes
	101.45%	101.5%	Yes
Limit test $\leq 0.02\%$	0.025%	0.03%	No
	0.015%	0.02%	Yes
	0.027%	0.03%	No
Limit test $\leq 3$ ppm	3.5 ppm	4 ppm	No
	3.4 ppm	3 ppm	Yes
	2.5 ppm	3 ppm	Yes

afroozpharma@yahoo.com

shall be used. Where reference is made to " $C_2H_5OH$ ," absolute (100 percent) ethanol is intended. Where a procedure calls for dehydrated alcohol, alcohol absolute, or anhydrous alcohol, the USP monograph article Dehydrated Alcohol shall be used.

**8.40. Atomic Weights**

Atomic weights used in computing molecular weights and the factors in the assays and elsewhere are those established by the IUPAC Commission on Isotopic Abundances and Atomic Weights. ▲USP40

**8.50. Blank Determinations**

Where it is directed that "any necessary correction" be made by a blank determination, the determination shall be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

**8.60. Concomitantly**

"Concomitantly" denotes that the determinations or measurements are to be performed in immediate succession.

**8.70. Desiccator**

The instruction "in a desiccator" indicates use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of a suitable desiccant such as anhydrous calcium chloride, magnesium perchlorate, phosphorus pentoxide, or silica gel. See also section 8.220 *Vacuum Desiccator*.

**8.80. Logarithms**

Logarithms are to the base 10.

**8.90. Microbial Strain**

A microbial strain cited and identified by its American Type Culture Collection (ATCC) catalog number shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

**8.100. Negligible**

"Negligible" indicates a quantity not exceeding 0.50 mg.

**8.110. NLT/NMT**

"NLT" means "not less than." "NMT" means "not more than."

**8.120. Odor**

"Odorless," "practically odorless," "a faint characteristic odor," and variations thereof indicate evaluation of a suitable quantity of freshly opened material after exposure to the air for 15 minutes. An odor designation is descriptive only and should not be regarded as a standard of purity for a particular lot of an article.

**8.130. Percent**

"Percent" used without qualification means:

- For mixtures of solids and semisolids, percent weight in weight;
- For solutions or suspensions of solids in liquids, percent weight in volume;
- For solutions of liquids in liquids, percent volume in volume;
- For solutions of gases in liquids, percent weight in volume.

For example, a 1 percent solution is prepared by dissolving 1 g of a solid or semisolid, or 1 mL of a liquid, in sufficient solvent to make 100 mL of the solution.

**8.140. Percentage Concentrations**

Percentage concentrations are expressed as follows:

- *Percent Weight in Weight (w/w)* is defined as the number of g of a solute in 100 g of solution.
- *Percent Weight in Volume (w/v)* is defined as the number of g of a solute in 100 mL of solution.
- *Percent Volume in Volume (v/v)* is defined as the number of mL of a solute in 100 mL of solution.

**8.150. Pressure**

Pressure is determined by use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

**8.160. Reaction Time**

Reaction time is 5 minutes unless otherwise specified.

**8.170. Specific Gravity**

Specific gravity is the weight of a substance in air at 25° divided by the weight of an equal volume of water at the same temperature.

**8.180. Temperatures**

Temperatures are expressed in centigrade (Celsius) degrees, and all measurements are made at 25° unless otherwise indicated. Where moderate heat is specified, any temperature not higher than 45° (113° F) is indicated.

**8.190. Time**

Unless otherwise specified, rounding rules, as described in section 7.20 *Rounding Rules*, apply to any time specified.

**8.200. Transfer**

"Transfer" indicates a quantitative manipulation.

**8.210. Vacuum**

"Vacuum" denotes exposure to a pressure of less than 20 mm of mercury (2.67 kPa), unless otherwise indicated.

**8.220. Vacuum Desiccator**

"Vacuum desiccator" indicates a desiccator that maintains a low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury (2.67 kPa) or at the pressure designated in the individual monograph.

**8.230. Water****8.230.10. Water as an Ingredient in an Official Product**

As an ingredient in an official product, water meets the requirements of the appropriate water monograph in USP or NF.

**8.230.20. Water in the Manufacture of Official Substances**

When used in the manufacture of official substances, water shall meet the requirements for drinking water as set forth in the U.S. Environmental Protection Agency National Primary Drinking Water Regulations or in the drinking water regulations of the European Union or of Japan, or in the World Health Organization's Guidelines for Drinking Water Quality. Additional specifications may be required in monographs.

**8.230.30. Water in a Compendial Procedure**

When water is called for in a compendial procedure, the USP article Purified Water shall be used unless otherwise specified. Definitions for other types of water are provided in *Reagents, Indicators, and Solutions* and in *Water for Pharmaceutical Purposes* (1231).

**8.240. Weights and Measures**

In general, weights and measures are expressed in the International System of Units (SI) as established and revised by the *Conférence générale des poids et mesures*. For compendial purposes, the term "weight" is considered to be synonymous with "mass."

Molality is designated by the symbol *m* preceded by a number that represents the number of moles of the designated solute contained in 1 kilogram of the designated solvent.

Molarity is designated by the symbol *M* preceded by a number that represents the number of moles of the designated solute contained in an amount of the designated solvent that is sufficient to prepare 1 liter of solution.

Normality is designated by the symbol *N* preceded by a number that represents the number of equivalents of the designated solute contained in an amount of the designated solvent that is sufficient to prepare 1 liter of solution.

The symbol for degrees (°) without a qualifying unit of measure represents degrees Celsius.

Chart of Symbols and Prefixes commonly employed for SI metric units and other units:

	Units	Symbol	Notes
Length			
	meter	m	

afroozpharma@yahoo.com

	Units	Symbol	Notes
	centimeter	cm	
	millimeter	mm	
	micrometer	μm	Previously referred to as a micron
	nanometer	nm	Previously the symbol mμ (for millimicron) was used
	Ångström	Å	Equal to 0.1 nm
Mass			
	kilogram	kg	
	gram	g	
	milligram	mg	
			The symbol μg is used in the USP and NF to represent micrograms, but micrograms may be represented as "mcg" for labeling and prescribing purposes. The term "gamma," symbolized by γ, frequently is used to represent micrograms in biochemical literature.
	microgram	μg	
	nanogram	ng	
	pico gram	pg	
			Also referred to as the unified atomic mass unit and is equal to 1/12 times the mass of the free carbon 12 atom.
	dalton	Da	
	kilodalton	kDa	
Time			
	second	s	
	minute	min	
	hour	h	
Volume			
	liter	L	1 L is equal to 1000 cm <sup>3</sup> (cubic centimeters)
	deciliter	dL	
	milliliter	mL	1 mL is equal to 1 cm <sup>3</sup> , sometimes referred to as cc
	microliter	μL	
Temperature			
	Celsius	°C	
Amount of Substance			
			Historically referred to as gram-molecular weight or gram-atomic weight
	mole	mol	
	millimole	mmol	
	micromole	μmol	
	femtomole	fmol	

	Units	Symbol	Notes
			Also referred to as gram-equivalent weight. It is used in the calculation of substance concentration in units of normality. This unit is no longer preferred for use in analytical chemistry or metrology.
	equivalent	Eq	
	milli equivalent	mEq	
			Osmotic pressure of a solution, related to substance concentration.
	osmole	Osmol	
	milliosmole	mOsmol	
Pressure			
	pascal	Pa	
	kilopascal	kPa	
	pounds per square inch	psi	
	millimeter of mercury	mmHg	Equal to 133.322 Pa
Electrical units			
	ampere	A	
	volt	V	
	millivolt	mV	
	hertz	Hz	Unit of frequency
	kilohertz	kHz	
	megahertz	MHz	
	electron volt	eV	
	kilo-electron volt	keV	
	mega-electron volt	MeV	
Radiation			
	becquerel	Bq	SI unit of activity for radionuclides
	kilobecquerel	kBq	
	megabecquerel	MBq	
	gigabecquerel	GBq	
	curie	Ci	Non-SI unit of activity for radionuclides
	millicurie	mCi	
	microcurie	μCi	
	nanocurie	nCi	
Other			
	acceleration due to gravity	g	Used to express rate of centrifugation
	revolutions per minute	rpm	Used to express rate of centrifugation

femto	f	$10^{-15}$

**9. PRESCRIBING AND DISPENSING****9.10. Use of Metric Units**

Prescriptions for compendial articles shall be written to state the quantity and/or strength desired in metric units unless otherwise indicated in the individual monograph (see also section 5.50.10 *Units of Potency [Biological]* above). If an amount is prescribed by any other system of measurement, only an amount that is the metric equivalent of the pre-

scribed amount shall be dispensed. Abbreviations for the terms "Units" or "International Units" shall not be used for labeling or prescribing purposes. Apothecary unit designations on labels and labeling shall not be used.

**9.20. Changes in Volume**

In the dispensing of prescription medications, slight changes in volume owing to variations in room temperatures may be disregarded.

**10. PRESERVATION, PACKAGING, STORAGE, AND LABELING****10.10. Packaging and Storage**

All articles in *USP* or *NF* are subject to the packaging and storage requirements specified in *Packaging and Storage Requirements* (659), unless different requirements are provided in an individual monograph.

**10.20. Labeling**

All articles in *USP* or *NF* are subject to the labeling requirements specified in *Labeling* (7), unless different requirements are provided in an individual monograph.

# Official Monographs for USP 40

## Abacavir Oral Solution

### DEFINITION

Abacavir Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of abacavir ( $C_{14}H_{18}N_6O$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Solution A:** Trifluoroacetic acid and water (0.05:99.95)

**Solution B:** Methanol and water (17:3)

**Diluent:** 1 mL of phosphoric acid diluted with water to 1000 mL

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	95	5
20	70	30
35	10	90
40	10	90
41	0	100
50	0	100
51	95	5
55	95	5

**System suitability solution:** 0.2 mg/mL of USP Abacavir System Suitability Mixture RS in *Diluent*

**Standard solution:** 0.46 mg/mL of USP Abacavir Sulfate RS in *Diluent*

**Sample solution:** Equivalent to 0.4 mg/mL of abacavir in *Diluent*, from Oral Solution. [NOTE—Sonicate, if necessary.]

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 15-cm; 5-μm packing L1

**Column temperature:** 30°

**Flow rate:** 0.8 mL/min

**Injection size:** 10 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between abacavir and *trans*-abacavir, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{14}H_{18}N_6O$  in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak area of abacavir from the *Sample solution*  
 $r_S$  = peak area of abacavir from the *Standard solution*

$C_S$  = concentration of USP Abacavir Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abacavir in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

- DELIVERABLE VOLUME (698):** Meets the requirements

### IMPURITIES

#### Organic Impurities

##### PROCEDURE

**Solution A, Solution B, Diluent, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Sensitivity solution:** 0.2 μg/mL of USP Abacavir Sulfate RS in *Diluent*, from the *Standard solution*. [NOTE—The concentration of this solution is 0.05% of the nominal concentration of the *Sample solution*.]

#### Analysis

**Samples:** *Diluent, Standard solution, Sample solution, and Sensitivity solution*. [NOTE—In the *Sample solution* disregard any peaks corresponding to peaks identified in the *Diluent* and any peak with a peak area less than the abacavir peak area in the *Sensitivity solution*.] Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak area of abacavir from the *Sample solution*  
 $r_S$  = peak area of abacavir from the *Standard solution*

$C_S$  = concentration of USP Abacavir Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abacavir in the *Sample solution* (mg/mL)

$F$  = relative response factor for each impurity from *Impurity Table 1*

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 2.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Cyclopropyldiaminopurine abacavir <sup>a</sup>	0.57	1.4	0.3
Descyclopropyl abacavir <sup>b</sup>	0.68	1.0	0.8
Abacavir	1.00	—	—
<i>trans</i> -Abacavir <sup>c</sup>	1.04	1.0	—
Any individual unspecified impurity	—	1.0	0.2

<sup>a</sup> N<sup>6</sup>-Cyclopropyl-9H-purine-2,6-diamine.<sup>b</sup> [(1*S*,4*R*)-4-(2,6-Diamino-9H-purin-9-yl)cyclopent-2-en-1-yl]methanol.<sup>c</sup> [(1*R*,4*R*)-4-[2-Amino-6-(cyclopropylamino)-9H-purin-9-yl]-cyclopent-2-en-1-yl]methanol. It is a process impurity and monitored in the drug substance.**SPECIFIC TESTS**

- MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 100 cfu/mL, and the total combined molds and yeast count does not exceed 10 cfu/mL. It also meets the requirement for absence of *Escherichia coli*.

- PH (791):** 3.8–4.5

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**  
USP Abacavir Sulfate RS  
USP Abacavir System Suitability Mixture RS  
A mixture containing abacavir sulfate and *trans*-abacavir

**Abacavir Tablets****DEFINITION**

Abacavir Tablets contain Abacavir Sulfate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O).

**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****PROCEDURE**

**Diluent:** 1.0 mL of phosphoric acid in 1 L of water

**Solution A:** Trifluoroacetic acid and water (0.05:99.95)

**Solution B:** Methanol and water (85:15)

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
20	70	30
35	10	90
40	10	90
41	95	5
50	95	5

**System suitability solution:** 0.2 mg/mL of USP Abacavir System Suitability Mixture RS in *Diluent*

**Standard solution:** 0.21 mg/mL of abacavir sulfate in *Diluent* (equivalent to 0.18 mg/mL of abacavir), from USP Abacavir Sulfate RS

**Sample stock solution:** Transfer the equivalent to 1500 mg of abacavir, from a portion of Tablets, into a 250-mL volumetric flask. Add 150 mL of *Diluent*. Shake mechanically for 45 min. Dilute with *Diluent* to volume. Pass a portion through a suitable filter of 0.45-μm or finer pore size. Discard the first 3 mL of the filtrate.

**Sample solution:** 0.18 mg/mL of abacavir in *Diluent* using the filtrate obtained in the *Sample stock solution*

**Chromatographic system**

(See Chromatography (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 15-cm; packing L1

**Flow rate:** 0.8 mL/min

**Injection volume:** 10 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.5 between abacavir and *trans*-abacavir, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of abacavir from the *Sample solution*

$r_S$  = peak response of abacavir from the *Standard solution*

$C_S$  = concentration of abacavir sulfate in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abacavir in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****DISSOLUTION (711)**

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 15 min

**Standard solution:** 0.39 mg/mL of USP Abacavir Sulfate RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** 254 nm

**Blank:** *Medium*

Calculate the percentage of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### • ORGANIC IMPURITIES

**Diluent, Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

#### Analysis

[NOTE—Record the chromatograms for 2.5 times the retention time of abacavir.]

**Samples:** *Standard solution* and *Sample solution*

- Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of abacavir from the *Standard solution*

$C_S$  = concentration of USP Abacavir Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abacavir in the *Sample solution* (mg/mL)

$F$  = relative response factor for each impurity (see *Table 2*)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

<sup>e</sup> N<sup>6</sup>-Cyclopropyl-9-[(1*R*,4*S*)-4-[(2,5-diamino-6-chloropyrimidin-4-yl)oxymethyl]cyclopent-2-enyl]-9H-purine-2,6-diamine.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Abacavir Sulfate RS  
USP Abacavir System Suitability Mixture RS—A mixture of abacavir sulfate and *trans*-abacavir.

## Abacavir and Lamivudine Tablets

### DEFINITION

Abacavir and Lamivudine Tablets contain an amount of abacavir sulfate and lamivudine equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O) and NLT 90.0% and NMT 110.0% of the labeled amount of lamivudine (C<sub>8</sub>H<sub>11</sub>N<sub>3</sub>O<sub>3</sub>S), respectively.

### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Diluent:** 0.1 N hydrochloric acid

**Solution A:** Water and trifluoroacetic acid (2000:1)

**Solution B:** Acetonitrile, methanol, and trifluoroacetic acid (1000:1000:1)

**Mobile phase:** See *Table 1*. [NOTE—Return to original conditions and re-equilibrate the system for about 7 min.]

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
4	100	0
12	70	30
12.1	40	60
13.1	40	60
13.2	100	0

**System suitability solution:** Dissolve the contents of one vial of USP Lamivudine Resolution Mixture C RS in 2.5 mL of *Diluent*. [NOTE—One vial of USP Lamivudine Resolution Mixture C RS contains 0.8 mg of USP Lamivudine Resolution Mixture C RS.]

**Standard solution:** 0.35 mg/mL of USP Abacavir Sulfate RS and 0.15 mg/mL of USP Lamivudine RS in *Diluent*. Sonicate to dissolve prior to final dilution.

**Sample stock solution:** Nominally 3 mg/mL of abacavir and 1.5 mg/mL of lamivudine in *Diluent* prepared as follows. Transfer NLT 5 Tablets to a suitable volumetric flask. Add *Diluent* to about 50% of the final volume and shake for NMT 30 min to disperse the Tablets. Dilute with *Diluent* to volume. Pass through a suitable filter.

**Sample solution:** Nominally 0.3 mg/mL of abacavir and 0.15 mg/mL of lamivudine in *Diluent* from *Sample stock solution*.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 15-cm; 3.5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for lamivudine-S-oxide and lamivudine-R-oxide, in relation to the lamivudine peak, are 0.31 and 0.36, respectively; the relative retention times for lamivudine diastereomer and lamivudine are 0.88 and 1.0, respectively; *System suitability solution*.]

#### Suitability requirements

**Resolution:** NLT 1.0 between lamivudine-S-oxide and lamivudine-R-oxide; NLT 1.0 between lamivudine

diastereomer and lamivudine, *System suitability solution*

**Relative standard deviation:** NMT 1.5% each for abacavir and lamivudine, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of abacavir ( $C_{14}H_{18}N_6O$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of abacavir from the *Sample solution*

$r_S$  = peak response of abacavir from the *Standard solution*

$C_S$  = concentration of USP Abacavir Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abacavir in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of abacavir

Calculate the percentage of the labeled amount of lamivudine ( $C_8H_{11}N_3O_3S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of lamivudine from the *Sample solution*

$r_S$  = peak response of lamivudine from the *Standard solution*

$C_S$  = concentration of USP Lamivudine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of lamivudine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of lamivudine

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Standard solution 1:** 0.79 mg/mL of USP Abacavir Sulfate RS in *Medium*. Sonicate to dissolve prior to final dilution.

**Standard solution 2:** 0.33 mg/mL of USP Lamivudine RS in *Medium*. Sonicate to dissolve prior to final dilution.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

##### Instrumental conditions

**Mode:** UV

**Wavelength:** 240–320 nm

**Cell length:** 0.2 mm

**Blank:** *Medium*

**Analysis:** The calculations of the percentages dissolved are performed using multi-component analysis software.

**Tolerances:** NLT 80% (Q) of the labeled amount of abacavir and lamivudine is dissolved.

##### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

Diluent, *Solution A*, *Solution B*, *Mobile phase*, *System suitability solution*, *Standard solution*, *Sample stock solution*, *Sample solution*, *Chromatographic system*, and *System suitability*: Proceed as directed in the Assay.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each individual abacavir related impurity and each unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each abacavir related impurity or unspecified impurity

$r_T$  = sum of the peak responses of abacavir, all abacavir related impurities, and all unspecified impurities

Calculate the percentage of each lamivudine related impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each lamivudine related impurity

$r_T$  = sum of the peak responses of lamivudine and all lamivudine related impurities

**Acceptance criteria:** See Table 2. Disregard any peak less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Cytosine <sup>a</sup>	0.12	0.2
Lamivudine-S-sulfoxide <sup>b</sup>	0.19	0.2
Lamivudine-R-sulfoxide <sup>c</sup>	0.21	0.2
Lamivudine-carboxylic acid <sup>d</sup>	0.49	— <sup>e</sup>
Lamivudine diastereomer (Lamivudine-trans) <sup>f</sup>	0.52	— <sup>e</sup>
Lamivudine	0.60	—
Lamivudine-uracil derivative <sup>g</sup>	0.78	0.2
Cyclopropyldiaminopurine abacavir <sup>h</sup>	0.80	0.2
Descyclopropyl abacavir <sup>i</sup>	0.85	0.2
3-Hydroxyabacavir <sup>j</sup>	0.89	— <sup>e</sup>
Abacavir	1.0	— <sup>e</sup>
Any individual unspecified impurity	—	0.2
Total lamivudine related impurities <sup>k</sup>	—	0.6
Total abacavir related impurities <sup>l</sup>	—	1.0

<sup>a</sup> 4-Aminopyrimidin-2(1H)-one (lamivudine related impurity).

<sup>b</sup> 1-[(2R,3S,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine S-oxide.

<sup>c</sup> 1-[(2R,3R,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine S-oxide.

<sup>d</sup> (2R,5S)-5-(Cytosine-1-yl)-1,3-oxathiolane-2-carboxylic acid.

<sup>e</sup> Process impurity monitored in the drug substance.

<sup>f</sup> 1-[(2S,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine.

<sup>g</sup> 1-[(2R,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]uracil.

<sup>h</sup> N<sup>6</sup>-Cyclopropyl-9H-purine-2,6-diamine.

<sup>i</sup> [(1S,4R)-4-(2,6-Diamino-9H-purin-9-yl)cyclopent-2-enyl]methanol.

<sup>j</sup> (1R,2R,4S)-2-[2-Amino-6-(cyclopropylamino)-9H-purin-9-yl]-4-(hydroxymethyl)cyclopentan-1-ol.

<sup>k</sup> Includes all lamivudine related impurities.

<sup>l</sup> Includes all abacavir related and all individual unspecified impurities.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.

# • **USP REFERENCE STANDARDS** (11)

USP Abacavir Sulfate RS

USP Lamivudine RS

USP Lamivudine Resolution Mixture C RS

This is a mixture of lamivudine and the following impurities (other impurities may also be present).

Uracil: Pyrimidine-2,4(1*H*,3*H*)-dione.

$C_4H_4N_2O_2$  112.09

Lamivudine-uracil derivative: 1-[(2*RS*,5*SR*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]uracil.

$C_8H_{10}N_2O_4S$  230.24

Cytosine: 4-Aminopyrimidin-2(1*H*)-one.

$C_4H_5N_3O$  111.10

Lamivudine-*S*-sulfoxide: 1-[(2*R*,3*S*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine *S*-oxide.

$C_8H_{11}N_3O_4S$  245.26

Lamivudine-*R*-sulfoxide: 1-[(2*R*,3*R*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine *S*-oxide.

$C_8H_{11}N_3O_4S$  245.26

Lamivudine carboxylic acid: (2*RS*,5*SR*)-5-(Cytosine-1-yl)-1,3-oxathiolane-2-carboxylic acid.

$C_8H_9N_3O_4S$  243.24

Lamivudine diastereomer: 1-[(2*S*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine.

$C_8H_{11}N_3O_3S$  229.26

Salicylic acid: 2-Hydroxybenzoic acid.

$C_7H_6O_3$  138.12

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 5-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Sample: Standard solution

Suitability requirements

Relative standard deviation: NMT 1.5%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of  $(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$  in the portion of Abacavir Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of abacavir from the Sample solution

$r_S$  = peak area of abacavir from the Standard solution

$C_S$  = concentration of USP Abacavir Sulfate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Abacavir Sulfate in the Sample solution (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous and solvent-free basis

## **IMPURITIES**

### **Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.2%

### **Organic Impurities**

- **PROCEDURE 1: RELATED COMPOUNDS**

Solution A: Trifluoroacetic acid and water (0.05:99.95)

Solution B: Methanol and water (17:3)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	95	5
20	70	30
35	10	90
35.1	95	5
50	95	5

System suitability solution: 0.25 mg/mL of USP Abacavir Related Compounds Mixture RS in water

Sample solution: 0.25 mg/mL of Abacavir Sulfate in water

### **Chromatographic system**

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 15-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Sample: System suitability solution

Suitability requirements

Resolution: NLT 1.5 between abacavir and trans-abacavir

Analysis

Sample: Sample solution

Calculate the percentage of each impurity in the portion of Abacavir Sulfate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak area of each impurity from the Sample solution

$r_T$  = sum of the areas of all the peaks from the Sample solution

## **Abacavir Sulfate**

$(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$  670.74

2-Cyclopentene-1-methanol, 4-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]-, (1*S*-*cis*)-, sulfate (salt) (2:1);

(1*S*,4*R*)-4-[2-Amino-6-(cyclopropylamino)-9*H*-purin-9-yl]-2-cyclopentene-1-methanol sulfate (salt) (2:1) [188062-50-2].

## **DEFINITION**

Abacavir Sulfate contains NLT 97.0% and NMT 102.0% of  $(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$ , calculated on the anhydrous and solvent-free basis.

## **IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)

- **B.** The retention time of the major peak of the Sample solution corresponds to that of the System suitability solution, obtained as directed in the test for Organic Impurities, Procedure 2.

- **C. IDENTIFICATION TESTS—GENERAL, Sulfate** (191)

Sample solution: 5 mg/mL

## **ASSAY**

- **PROCEDURE**

Mobile phase: Acetonitrile, phosphoric acid, and water (20:1:180)

Standard solution: 0.04 mg/mL of USP Abacavir Sulfate RS in water

Sample solution: 0.04 mg/mL of Abacavir Sulfate in water

Chromatographic system

(See Chromatography (621), System Suitability.)

## Acceptance criteria

Individual impurities: See Impurity Table 1.

Total impurities: NMT 0.8%

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Descyclopropyl abacavir <sup>a</sup>	0.65	0.2
Abacavir	1.00	—
<i>trans</i> -Abacavir <sup>b</sup>	1.04	0.2

Any unspecified impurity	—	0.1

<sup>a</sup> [(1*S*,4*R*)-4-(2,6-Diamino-9*H*-purin-9-yl)cyclopent-2-enyl]methanol.<sup>b</sup> [(1*R*,4*R*)-4-[2-Amino-6-(cyclopropylamino)-9*H*-purin-9-yl]-cyclopent-2-enyl]methanol.<sup>c</sup> *N*-(Cyclopropyl-9-[(1*R*,4*S*)-4-[(2,5-diamino-6-chloropyrimidin-4-yl-oxy)methyl]cyclopent-2-enyl]-9*H*-purine-2,6-diamine.<sup>d</sup> 9-[(1*R*,4*S*)-4-(*tert*-Butoxymethyl)cyclopent-2-enyl]-*N*-(cyclopropyl-9*H*-purine-2,6-diamine.

## • PROCEDURE 2: ENANTIOMERIC PURITY

Solution A: Heptane, 2-propanol, and diethylamine (850:150:1).

Solution B: Heptane and 2-propanol (1:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
0	100	0	1.0
25	100	0	1.0
27	0	100	0.8
37	0	100	0.8
39	100	0	1.0
55	100	0	1.0

Diluent: Methanol and trifluoroacetic acid (200:1)

**System suitability solution:** Transfer a quantity of USP Abacavir Stereoisomers Mixture RS to a suitable volumetric flask, add a volume of *Diluent* equivalent to 30% of the final volume, and sonicate until the solid is fully dissolved. Add a volume of 2-propanol equivalent to about 30% of the final volume, mix, and dilute with heptane to volume to obtain 0.4 mg/mL of USP Abacavir Stereoisomers Mixture RS.

**Sample solution:** Transfer 4 mg of Abacavir Sulfate to a 10-mL volumetric flask. Add 3 mL of *Diluent*, and sonicate until the solid is fully dissolved. Add 3 mL of 2-propanol, mix, and dilute with heptane to volume.

**Chromatographic system**

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 286 nm

Column: 4.6-mm × 25-cm; 10-μm packing L51

Column temperature: 30°

Injection size: 20 μL

**System suitability**

[NOTE—The relative retention times for *trans*-abacavir, abacavir enantiomer, and abacavir are 0.8, 0.9, and 1.0, respectively.]

Sample: System suitability solution

**Suitability requirements**

Resolution: NLT 1.0 between *trans*-abacavir and abacavir enantiomer; NLT 1.5 between abacavir enantiomer and abacavir

**Analysis**

Sample: Sample solution

Calculate the percentage of abacavir enantiomer in the portion of Abacavir Sulfate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

 $r_U$  = peak area of abacavir enantiomer from the Sample solution

 $r_T$  = total peak areas of abacavir and abacavir enantiomer from the Sample solution
**Acceptance criteria**

Individual impurities: NMT 0.3% of abacavir enantiomer

**SPECIFIC TESTS**• **WATER DETERMINATION, Method 1c (921):** NMT 0.5%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.• **USP REFERENCE STANDARDS (11)**

USP Abacavir Sulfate RS

USP Abacavir Stereoisomers Mixture RS

A mixture of abacavir sulfate, abacavir enantiomer, and *trans*-abacavir.

USP Abacavir Related Compounds Mixture RS

A mixture of abacavir glutarate, O-pyrimidine derivative abacavir, descyclopropyl abacavir, *trans*-abacavir, and *t*-butyl derivative abacavir.**Abiraterone Acetate**

$C_{26}H_{33}NO_2$  391.55  
 Androsta-5,16-dien-3-ol, 17-(3-pyridinyl)-, acetate (ester), (3β);  
 17-(Pyridin-3-yl)androsta-5,16-dien-3β-yl acetate  
 [154229-18-2].

**DEFINITION**

Abiraterone Acetate contains NLT 98.0% and NMT 102.0% of abiraterone acetate ( $C_{26}H_{33}NO_2$ ), calculated on the as-is basis.

**IDENTIFICATION**• **A. INFRARED ABSORPTION (197K)**

• **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

Solution A: 10 mM of ammonium acetate in water  
 Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Acetonitrile (%)	Ethanol (%)
0	50	20	30
40	15	55	30
47	0	20	80
58	0	20	80

Table 1 (Continued)

Time (min)	Solution A (%)	Acetonitrile (%)	Ethanol (%)
60	50	20	30
70	50	20	30

[NOTE—Protect solutions from light.]

**System suitability solution:** 0.625 mg/mL of USP Abiraterone System Suitability Mixture RS in acetonitrile.

[NOTE—See Table 2 for relative retention times of the main components of the mixture.]

Table 2

Name	Relative Retention Time
7-Ketoabiraterone acetate	0.42
$\alpha$ -Epoxyabiraterone acetate	0.62
$\beta$ -Epoxyabiraterone acetate	0.66
Abiraterone	0.69
3-Deoxy-3-acetyl abiraterone-3-ene	0.85
Abiraterone acetate	1.0
Abiraterone ethyl ether	1.18
Abiraterone isopropyl ether	1.26
Anhydro abiraterone	1.29
3-Deoxy 3-chloroabiraterone	1.31
O-Chlorobutylabiraterone	1.33

**Standard solution:** 0.625 mg/mL of USP Abiraterone Acetate RS in acetonitrile

**Sample solution:** 0.625 mg/mL of Abiraterone Acetate in acetonitrile

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3-mm  $\times$  15-cm; 3- $\mu$ m packing L1

**Flow rate:** 0.45 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Samples:** System suitability solution and Standard solution

#### Suitability requirements

**Resolution:** NLT 1.0 between anhydro abiraterone and 3-deoxy 3-chloroabiraterone peaks, System suitability solution

**Relative standard deviation:** NMT 0.73%, Standard solution

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of abiraterone acetate ( $C_{26}H_{33}NO_2$ ) in the portion of Abiraterone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Abiraterone Acetate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Abiraterone Acetate in the Sample solution (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the as-is basis

#### IMPURITIES

• **RESIDUE ON IGNITION (281):** NMT 0.1%

• **ORGANIC IMPURITIES**

[NOTE—Protect solutions from light.]

**Solution A, Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**Sensitivity solution:** 0.3  $\mu$ g/mL of USP Abiraterone Acetate RS in acetonitrile, from Standard solution

#### System suitability

**Samples:** System suitability solution, Standard solution, and Sensitivity solution

#### Suitability requirements

**Resolution:** NLT 1.0 between anhydro abiraterone and 3-deoxy 3-chloroabiraterone peaks, System suitability solution

**Signal-to-noise ratio:** NLT 10, Sensitivity solution

**Relative standard deviation:** NMT 0.73%, Standard solution

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Abiraterone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak area of each impurity from the Sample solution

$r_S$  = peak area of abiraterone acetate from the Standard solution

$C_S$  = concentration of USP Abiraterone Acetate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Abiraterone Acetate in the Sample solution (mg/mL)

$F$  = relative response factor for each individual impurity (see Table 3)

**Acceptance criteria:** See Table 3. Disregard any peak less than 0.05%.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
$\alpha$ -Epoxyabiraterone acetate	0.62	0.26	0.25
$\beta$ -Epoxyabiraterone acetate	0.66	0.26	0.25
Abiraterone	0.69	1.0	0.20
Abiraterone acetate	1.0	—	—
Abiraterone ethyl ether	1.18	1.0	0.20
Abiraterone isopropyl ether	1.26	1.0	0.20
Unspecified impurity	—	1.0	0.10
Total impurities	—	—	0.80

#### SPECIFIC TESTS

• **WATER DETERMINATION, Method 1c (921):** NMT 0.25%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature and protect from light.

• **USP REFERENCE STANDARDS (11)**

USP Abiraterone Acetate RS

USP Abiraterone System Suitability Mixture RS

It contains Abiraterone Acetate and small amounts of the following:

Abiraterone

17-(Pyridin-3-yl)androsta-5,16-dien-3 $\beta$ -ol.

$C_{24}H_{31}NO$  349.52

Abiraterone ethyl ether

3 $\beta$ -Ethoxy-17-(pyridin-3-yl)androsta-5,16-diene.

$C_{26}H_{35}NO$  377.57

Abiraterone isopropyl ether

3 $\beta$ -Isopropoxy-17-(pyridin-3-yl)androsta-5,16-diene.

$C_{27}H_{37}NO$	391.60
Anhydro abiraterone	
17-(Pyridin-3-yl)androsta-3,5,16-triene.	
$C_{24}H_{29}N$	331.50
O-Chlorobutylabiraterone	
3 $\beta$ -(4-Chlorobutoxy)-17-(pyridin-3-yl)androsta-5,16-diene.	
$C_{28}H_{38}ClNO$	440.07
3-Deoxy-3-acetyl abiraterone-3-ene	
1-[17-(Pyridin-3-yl)androsta-3,5,16-trien-3-yl]ethanone.	
$C_{26}H_{31}NO$	373.53
3-Deoxy 3-chloroabiraterone	
3 $\beta$ -Chloro-17-(pyridin-3-yl)androsta-5,16-diene.	
$C_{24}H_{30}ClN$	367.96
$\alpha$ -Epoxyabiraterone acetate	
17-(Pyridin-3-yl)-16 $\alpha$ ,17 $\alpha$ -epoxyandrost-5-en-3 $\beta$ -yl acetate.	
$C_{26}H_{33}NO_3$	407.55
$\beta$ -Epoxyabiraterone acetate	
17-(Pyridin-3-yl)-16 $\beta$ ,17 $\beta$ -epoxyandrost-5-en-3 $\beta$ -yl acetate.	
$C_{26}H_{33}NO_3$	407.55
7-Ketoabiraterone acetate	
7-Oxo-17-(pyridin-3-yl)androsta-5,16-dien-3 $\beta$ -yl acetate.	
$C_{26}H_{31}NO_3$	405.54

## Abiraterone Acetate Tablets

### DEFINITION

Abiraterone Acetate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of abiraterone acetate ( $C_{26}H_{33}NO_2$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Solution A:** 10 mM of ammonium acetate in water  
**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Acetonitrile (%)	Ethanol (%)
0	50	20	30
40	15	55	30
47	0	20	80
58	0	20	80
60	50	20	30
70	50	20	30

[NOTE—Protect solutions from light.]

**System suitability solution:** 0.625 mg/mL of USP Abiraterone System Suitability Mixture RS in acetonitrile.

[NOTE—See Table 2 for relative retention times of the main components of the mixture.]

Table 2

Name	Relative Retention Time
7-Ketoabiraterone acetate	0.42
$\alpha$ -Epoxyabiraterone acetate	0.62
$\beta$ -Epoxyabiraterone acetate	0.66

Table 2 (Continued)

Name	Relative Retention Time
Abiraterone	0.69
3-Deoxy-3-acetyl abiraterone-3-ene	0.85
Abiraterone acetate	1.0
Abiraterone ethyl ether	1.18
Abiraterone isopropyl ether	1.26
Anhydro abiraterone	1.29
3-Deoxy 3-chloroabiraterone	1.31
O-Chlorobutylabiraterone	1.33

**Standard solution:** 0.625 mg/mL of USP Abiraterone Acetate RS in acetonitrile

**Sample solution:** Nominally equivalent to 0.625 mg/mL of abiraterone acetate in acetonitrile, prepared from NLT 20 powdered Tablets as follows. Transfer the powder to a suitable volumetric flask. Add 50% of the flask volume of acetonitrile, shake by mechanical means for 30 min, and dilute with acetonitrile to volume. Pass a portion of the solution through a suitable filter of 0.45- $\mu$ m pore size, and use the clear solution for analysis.

### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 254 nm or diode array. [NOTE—Use diode array detector to perform Identification test B.]

**Column:** 3-mm  $\times$  15-cm; 3- $\mu$ m packing L1

**Column temperature:** 15 $^{\circ}$

**Flow rate:** 0.45 mL/min

**Injection volume:** 10  $\mu$ L

### System suitability

**Samples:** System suitability solution and Standard solution

### Suitability requirements

**Resolution:** NLT 1.0 between anhydro abiraterone and 3-deoxy 3-chloroabiraterone peaks, System suitability solution

**Relative standard deviation:** NMT 2.0%, Standard solution

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of the labeled amount of abiraterone acetate ( $C_{26}H_{33}NO_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Abiraterone Acetate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of abiraterone acetate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION <711>

[NOTE—Protect solutions from light.]

**Buffer:** 56.5 mM of monobasic sodium phosphate in water. Adjust with 5 N sodium hydroxide or phosphoric acid to a pH of 4.5.

**Medium:** 0.25% of sodium lauryl sulfate in *Buffer*, 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Standard solution:** 0.3 mg/mL of USP Abiraterone Acetate RS in *Medium* prepared as follows. Transfer USP Abiraterone Acetate RS into a suitable volumetric flask. Add 4% of the flask volume of acetonitrile to dissolve, and dilute with *Medium* to volume.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 10- $\mu$ m pore size. Use the filtrate.

**Mobile phase:** Acetonitrile, formic acid, and water (55:0.05:45)

**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 252 nm

**Column:** 4.6-mm  $\times$  3-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of abiraterone acetate ( $C_{26}H_{33}NO_2$ ) dissolved:

$$(r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 85% (Q) of the labeled amount of abiraterone acetate ( $C_{26}H_{33}NO_2$ ) is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### ORGANIC IMPURITIES

[NOTE—Protect solutions from light.]

**Solution A, Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Sensitivity solution:** 0.3  $\mu$ g/mL of USP Abiraterone Acetate RS in acetonitrile from *Standard solution*

**System suitability**

**Samples:** *System suitability solution*, *Standard solution*, and *Sensitivity solution*

**Suitability requirements**

**Resolution:** NLT 1.0 between anhydro abiraterone and 3-deoxy 3-chloroabiraterone peaks, *System suitability solution*

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak area of each impurity from the *Sample solution*

$r_S$  = peak area of abiraterone acetate from the *Standard solution*

$C_S$  = concentration of USP Abiraterone Acetate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abiraterone acetate in the *Sample solution* (mg/mL)

$F$  = relative response factor for each individual impurity (see *Table 3*)

**Acceptance criteria:** See *Table 3*. Disregard any peak less than 0.05%.

**Table 3**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
7-Ketoabiraterone acetate	0.42	1.4	0.50
$\alpha$ -Epoxyabiraterone acetate	0.62	0.26	0.80
$\beta$ -Epoxyabiraterone acetate	0.66	0.26	0.80
Abiraterone	0.69	1.0	0.40
Abiraterone acetate	1.0	—	—
Abiraterone ethyl ether <sup>a</sup>	1.18	—	—
Abiraterone isopropyl ether <sup>a</sup>	1.26	—	—
Unspecified impurity	—	1.0	0.20
Total impurities	—	—	2.0

<sup>a</sup> This is a process impurity and is controlled in the drug substance monograph. It is included in the table for identification only, and it is not to be reported in the total impurities.

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

### USP REFERENCE STANDARDS (11)

USP Abiraterone Acetate RS

USP Abiraterone System Suitability Mixture RS

It contains Abiraterone Acetate and small amounts of the following:

Abiraterone

17-(Pyridin-3-yl)androsta-5,16-dien-3 $\beta$ -ol.

$C_{24}H_{31}NO$  349.52

Abiraterone ethyl ether

3 $\beta$ -Ethoxy-17-(pyridin-3-yl)androsta-5,16-diene.

$C_{26}H_{35}NO$  377.57

Abiraterone isopropyl ether

3 $\beta$ -Isopropoxy-17-(pyridin-3-yl)androsta-5,16-diene.

$C_{27}H_{37}NO$  391.60

Anhydro abiraterone

17-(Pyridin-3-yl)androsta-3,5,16-triene.

$C_{24}H_{29}N$  331.50

O-Chlorobutylabiraterone

3 $\beta$ -(4-Chlorobutoxy)-17-(pyridin-3-yl)androsta-5,16-diene.

$C_{28}H_{38}ClNO$  440.07

3-Deoxy-3-acetyl abiraterone-3-ene

1-[17-(Pyridin-3-yl)androsta-3,5,16-trien-3-yl]ethanone.

$C_{26}H_{31}NO$  373.53

3-Deoxy 3-chloroabiraterone

3 $\beta$ -Chloro-17-(pyridin-3-yl)androsta-5,16-diene.

$C_{24}H_{30}ClN$  367.96

$\alpha$ -Epoxyabiraterone acetate

17-(Pyridin-3-yl)-16 $\alpha$ ,17 $\alpha$ -epoxyandrost-5-en-3 $\beta$ -yl acetate.

$C_{26}H_{33}NO_3$  407.55

$\beta$ -Epoxyabiraterone acetate

17-(Pyridin-3-yl)-16 $\beta$ ,17 $\beta$ -epoxyandrost-5-en-3 $\beta$ -yl acetate.

$C_{26}H_{33}NO_3$  407.55

7-Ketoabiraterone acetate

7-Oxo-17-(pyridin-3-yl)androsta-5,16-dien-3 $\beta$ -yl acetate.

$C_{26}H_{31}NO_3$

## Acarbose

$C_{25}H_{43}NO_{18}$  645.60  
 D-Glucose, O-4,6-dideoxy-4-[[[1S-(1 $\alpha$ ,4 $\alpha$ ,5 $\beta$ ,6 $\alpha$ )]-4,5,6-trihydroxy-3-(hydroxymethyl)-2-cyclohexen-1-yl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-;  
 O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)-2-cyclohexen-1-yl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-glucose [56180-94-0].

### DEFINITION

Acarbose is produced by certain strains of *Actinoplanes utahensis*. It contains NLT 95.0% and NMT 102.0% of acarbose ( $C_{25}H_{43}NO_{18}$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** 0.6 mg/mL of monobasic potassium phosphate and 0.35 mg/mL of dibasic sodium phosphate in water

**Mobile phase:** Acetonitrile and *Solution A* (3:1)

**System suitability solution:** 20 mg/mL of USP Acarbose System Suitability Mixture RS in water

**Standard solution:** 20 mg/mL of USP Acarbose RS in water

**Sample solution:** 20 mg/mL of Acarbose in water

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4-mm  $\times$  25-cm; packing L8

**Column temperature:** 35°

**Flow rate:** 2 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

Identify the acarbose peak and the peaks due to the impurities listed in *Table 1*.

#### Suitability requirements

**Peak-to-valley ratio:** The ratio of the height of the impurity A peak to the height of the valley between the impurity A peak and the acarbose peak is NLT 1.2.

**Chromatogram comparability:** The chromatogram obtained is similar to the chromatogram provided with USP Acarbose System Suitability Mixture RS for the known impurities found.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acarbose ( $C_{25}H_{43}NO_{18}$ ) in the portion of Acarbose taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Acarbose RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–102.0% on the anhydrous basis

### IMPURITIES

#### • RESIDUE ON IGNITION (281)

**Sample:** 1.0 g

Acceptance criteria: NMT 0.2%

#### Delete the following:

- **HEAVY METALS, Method II (231):** NMT 20 ppm (Official 1-Jan-2018)

#### • CHROMATOGRAPHIC PURITY

**Mobile phase, System suitability solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Diluted sample solution:** Dilute 1.0 mL of the *Sample solution* with water to 100.0 mL.

#### Analysis

**Samples:** *Sample solution* and *Diluted sample solution*  
 Calculate the percentage of each impurity in the portion of Acarbose taken:

$$\text{Result} = (r_U/r_A) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_A$  = peak response of the main acarbose peak from the *Diluted sample solution*

$F$  = relative response factor for each impurity (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity A <sup>a</sup>	0.9	1	0.6
Impurity B <sup>b</sup>	0.8	1.6	0.5
Impurity C <sup>c</sup>	1.2	1	1.5
Impurity D <sup>d</sup>	0.5	1.33	1.0
Impurity E <sup>e</sup>	1.7	0.8	0.2
Impurity F <sup>f</sup>	1.9	0.8	0.3
Impurity G <sup>g</sup>	2.2	0.8	0.3
Impurity H <sup>h</sup>	0.6	1	0.2

<sup>a</sup> O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-arabino-hex-2-ulopyranose.

<sup>b</sup> (1R,4R,5S,6R)-4,5,6-Trihydroxy-2-(hydroxymethyl)cyclohex-2-enyl 4-O-[4,6-dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl]- $\alpha$ -D-glucopyranoside.

<sup>c</sup>  $\alpha$ -D-Glucopyranosyl 4-O-[4,6-dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl]- $\alpha$ -D-glucopyranoside.

<sup>d</sup> 4-O-[4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl]-D-glucopyranose.

<sup>e</sup> O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-arabino-hex-2-ulopyranose (4-O- $\alpha$ -acarbosyl-D-fructopyranose).

<sup>f</sup> O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-glucopyranose (4-O- $\alpha$ -acarbosyl-D-glucopyranose).

<sup>g</sup>  $\alpha$ -D-Glucopyranosyl O-4,6-dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranoside ( $\alpha$ -D-glucopyranosyl  $\alpha$ -acarboside).

<sup>h</sup> O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O-6-deoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-glucopyranose.

Table 1 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Any individual unknown impurity	—	—	0.2
Total impurities	—	—	3.0

<sup>a</sup> O-4,6-Dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-O-α-D-glucopyranosyl-(1→4)-D-arabino-hex-2-ulopyranose.

<sup>b</sup> (1R,4R,5S,6R)-4,5,6-Trihydroxy-2-(hydroxymethyl)cyclohex-2-enyl 4-O-[4,6-dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-D-glucopyranoside.

<sup>c</sup> α-D-Glucopyranosyl 4-O-[4,6-dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-D-glucopyranoside.

<sup>d</sup> 4-O-[4,6-Dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-D-glucopyranose.

<sup>e</sup> O-4,6-Dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-O-α-D-glucopyranosyl-(1→4)-O-α-D-glucopyranosyl-(1→4)-D-arabino-hex-2-ulopyranose (4-O-α-acarbosyl-D-fructopyranose).

<sup>f</sup> O-4,6-Dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-O-α-D-glucopyranosyl-(1→4)-O-α-D-glucopyranosyl-(1→4)-D-glucopyranose (4-O-α-acarbosyl-D-glucopyranose).

<sup>g</sup> α-D-Glucopyranosyl O-4,6-dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-O-α-D-glucopyranosyl-(1→4)-O-α-D-glucopyranoside (α-D-glucopyranosyl α-acarboside).

<sup>h</sup> O-4,6-Dideoxy-4-[[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)]-O-6-deoxy-α-D-glucopyranosyl-(1→4)-D-glucopyranose.

### SPECIFIC TESTS

#### • OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: 10 mg/mL in water

Acceptance criteria: +168° to +183°

#### • pH (791)

Sample solution: 50 mg/mL

Acceptance criteria: 5.5–7.5

#### • WATER DETERMINATION, Method 1c (921): NMT 4.0%

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in tight containers.

## Acebutolol Hydrochloride

$C_{18}H_{28}N_2O_4 \cdot HCl$  372.89

Butanamide, N-[3-acetyl-4-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]-, monohydrochloride, (±); (±)-3'-Acetyl-4'-[2-hydroxy-3-(isopropylamino)propoxy]-butyranilide monohydrochloride [34381-68-5].

### DEFINITION

Acebutolol Hydrochloride contains NLT 98.0% and NMT 102.0% of acebutolol hydrochloride ( $C_{18}H_{28}N_2O_4 \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

• B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• C. **IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements when tested as directed for alkaloidal hydrochlorides.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Methanol, glacial acetic acid, and 0.3% aqueous solution of sodium dodecyl sulfate (675:20:325). Make adjustments if necessary to achieve a retention time for acebutolol of between 4 and 7 min.

**Standard solution:** 0.14 mg/mL of USP Acebutolol Hydrochloride RS in water

**Sample solution:** 0.14 mg/mL of Acebutolol Hydrochloride in water

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 10 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1500 theoretical plates

**Tailing factor:** NMT 2.5

**Relative standard deviation:** 0.73%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acebutolol hydrochloride ( $C_{18}H_{28}N_2O_4 \cdot HCl$ ) in the portion of Acebutolol Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of acebutolol from the *Sample solution*

$r_S$  = peak response of acebutolol from the *Standard solution*

$C_S$  = concentration of USP Acebutolol Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Acebutolol Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

#### • RESIDUE ON IGNITION (281): NMT 0.1%

#### Delete the following:

#### • HEAVY METALS, Method II (231): NMT 20 ppm (Official 1-Jan-2018)

#### • ORGANIC IMPURITIES

**Solution A:** Mix 2.0 mL of phosphoric acid and 3.0 mL of triethylamine, and dilute with water to 1 L.

**Solution B:** Acetonitrile and *Solution A* (1:1)

**Standard stock solution 1:** 0.2 mg/mL of USP Acebutolol Related Compound A RS prepared as follows. Dissolve a suitable amount of USP Acebutolol Related Compound A RS in a suitable volumetric flask, in 50% of the total volume of acetonitrile, and dilute with *Solution A* to volume.

**Standard stock solution 2:** 0.2 mg/mL of USP Acebutolol Related Compound B RS prepared as follows. Dissolve a suitable amount of USP Acebutolol Related Compound B RS in a suitable volumetric flask, in 50% of the total volume of acetonitrile, and dilute with *Solution A* to volume.

**Standard solution A:** 0.002 mg/mL of USP Acebutolol Hydrochloride RS in *Solution A*

**Standard solution B:** 0.004 mg/mL of USP Acebutolol Related Compound I RS in *Solution A*

**Standard solution C:** 0.002 mg/mL of USP Acebutolol Related Compound A RS in *Solution A* from *Standard stock solution 1*

**Standard solution D:** 0.004 mg/mL of USP Acebutolol Related Compound B RS in *Solution A* from *Standard stock solution 2*

**System suitability solution:** 0.4 µg/mL each of USP Acebutolol Hydrochloride RS and USP Acebutolol Related Compound I RS in *Solution A* from *Standard solution A* and *Standard solution B*

**Sample solution:** 2 mg/mL of Acebutolol Hydrochloride in *Solution A*

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	98	2
2	98	2
30.5	10	90
41	10	90

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.0-mm × 12.5-cm; 5-µm packing L1

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection volume:** 25 µL

#### System suitability

**Samples:** *Standard solution A* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 7.0 between acebutolol and acebutolol related compound I, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution A*

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, and *Sample solution*

Calculate the percentage of acebutolol related compound A, acebutolol related compound B, and acebutolol related compound I in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of acebutolol related compound A or acebutolol related compound I from the *Sample solution*

$r_S$  = peak response of acebutolol related compound A or acebutolol related compound I from *Standard solution B*, *Standard solution C*, or *Standard solution D*

$C_S$  = concentration of USP Acebutolol Related Compound A RS or USP Acebutolol Related Compound B RS or USP Acebutolol Related Compound I RS in *Standard solution B*, *Standard solution C*, or *Standard solution D* (mg/mL)

$C_U$  = concentration of Acebutolol Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any unspecified impurity from the *Sample solution*

$r_S$  = peak response of acebutolol from *Standard solution A*

$C_S$  = concentration of USP Acebutolol Hydrochloride RS in *Standard solution A* (mg/mL)

$C_U$  = concentration of Acebutolol Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** See *Table 2*. Disregard peaks below 0.05%.

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Acebutolol related compound B <sup>a</sup>	0.72	0.2
Acebutolol related compound I <sup>b</sup>	0.91	0.2
Acebutolol	1.00	—
Acebutolol related compound A <sup>c</sup>	1.48	0.1
Any unspecified impurity	—	0.10
Total impurities <sup>d</sup>	—	0.5

<sup>a</sup> N-[3-Acetyl-4-[2-hydroxy-3-(isopropylamino)propoxy]phenyl]acetamide.

<sup>b</sup> N-[3-Acetyl-4-[3-(ethylamino)-2-hydroxypropoxy]phenyl]butyramide.

<sup>c</sup> N-(3-Acetyl-4-hydroxyphenyl)butyramide.

<sup>d</sup> Total impurities include specified and unspecified impurities.

#### SPECIFIC TESTS

##### • pH (791)

**Sample:** 10 mg/mL of Acebutolol Hydrochloride in water

**Acceptance criteria:** 4.5–7.0

##### • LOSS ON DRYING (731)

**Analysis:** Dry at 105° for 3 h.

**Acceptance criteria:** NMT 1.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

##### • USP REFERENCE STANDARDS (11)

USP Acebutolol Hydrochloride RS

USP Acebutolol Related Compound A RS

N-(3-Acetyl-4-hydroxyphenyl)butyramide.

## Acebutolol Hydrochloride Capsules

#### DEFINITION

Acebutolol Hydrochloride Capsules contain the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of acebutolol (C<sub>18</sub>H<sub>28</sub>N<sub>2</sub>O<sub>4</sub>).

**IDENTIFICATION****Add the following:**

- ▲ **A.** The UV absorption spectra of the major peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak of the *Standard solution*, as obtained in the *Assay*. ▲<sup>USP40</sup>

**Change to read:**

- ▲**B.**▲<sup>USP40</sup> The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****Change to read:**• **PROCEDURE**

**Buffer:** Dissolve 2.4 g of sodium 1-decanesulfonate in 1000 mL of water. Adjust with glacial acetic acid to a pH of 3.5.

**Mobile phase:** Methanol and *Buffer* (60:40)

**Standard solution:** 0.22 mg/mL of USP Acebutolol Hydrochloride RS in methanol. [NOTE—This is equivalent to 0.2 mg/mL of acebutolol.]

**Sample stock solution:** Nominally 1 mg/mL of acebutolol prepared as follows. Transfer an equivalent to 200 mg of acebutolol, from the contents of NLT 20 Capsules, to a 200-mL volumetric flask. Add 180 mL of methanol, and stir by mechanical means for 30 min. Dilute with methanol to volume.

**Sample solution:** Nominally 0.2 mg/mL of acebutolol in methanol from *Sample stock solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm. ▲For *Identification A*, use a diode-array detector in the range of 200–400 nm. ▲<sup>USP40</sup>

**Column:** 3.9-mm × 15-cm; ▲4-μm▲<sup>USP40</sup> packing L1

**Relative standard deviation:** NMT 2.0

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acebutolol ( $C_{18}H_{28}N_2O_4$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of acebutolol from the *Sample solution*

$r_S$  = peak response of acebutolol from the *Standard solution*

$C_S$  = concentration of USP Acebutolol Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acebutolol from the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of acebutolol, ▲336.43▲<sup>USP40</sup>

$M_{r2}$  = molecular weight of acebutolol hydrochloride, 372.89

Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS****Change to read:**• **DISSOLUTION** (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution:** A known concentration of USP Acebutolol Hydrochloride RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Instrumental conditions**

(See *Ultraviolet-Visible Spectroscopy* (857).)

**Mode:** UV

**Analytical wavelength:** 232 nm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

▲Calculate the percentage of the labeled amount of acebutolol ( $C_{18}H_{28}N_2O_4$ ) dissolved:

$$(A_U/A_S) \times C_S \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of acebutolol in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

$M_{r1}$  = molecular weight of acebutolol, 336.43

$M_{r2}$  = molecular weight of acebutolol hydrochloride, 372.89▲<sup>USP40</sup>

**Tolerances:** NLT 80% (Q) of the labeled amount of acebutolol ( $C_{18}H_{28}N_2O_4$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**IMPURITIES****Change to read:**• **ORGANIC IMPURITIES**

**Test 1**

**Buffer:** Prepare as directed in the *Assay*.

**Mobile phase:** Methanol and *Buffer* (44:56)

**Diluent:** Methanol and *Buffer* (50:50)

**Standard stock solution:** 0.6 mg/mL of USP

Acebutolol Hydrochloride RS prepared as follows. To a suitable amount of USP Acebutolol Hydrochloride RS in a suitable volumetric flask, add methanol, about 24% of the flask volume, swirl to dissolve, and dilute with *Diluent* to volume.

**Standard solution:** 1.4 μg/mL of USP Acebutolol Hydrochloride RS in *Diluent* from *Standard stock solution*

**Sample stock solution:** Nominally 2.5 mg/mL of acebutolol prepared as follows. Transfer a portion of the contents of 20 opened Capsules, equivalent to 250 mg of acebutolol, to a 100-mL volumetric flask. Add 25 mL of methanol and shake by mechanical means for 15 min. Dilute with *Diluent* to volume. Centrifuge a portion of this solution and use the supernatant.

**Sample solution:** Nominally 250 μg/mL of acebutolol in *Diluent* from *Sample stock solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 240 nm  
 Column: 3.9-mm × 15-cm; 4-μm packing L1  
 Flow rate: 1 mL/min  
 Injection volume: 35 μL  
 Run time: NLT 2 times the retention time of acebutolol

**System suitability**

Sample: Standard solution

**Suitability requirements**

Relative standard deviation: NMT 6.0%

**Analysis**

Samples: Diluent, Standard solution, and Sample solution

Calculate the percentage of each impurity eluting before the acebutolol peak in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of each individual impurity from the *Sample solution*  
 $r_S$  = peak response of acebutolol from the *Standard solution*  
 $C_S$  = concentration of USP Acebutolol Hydrochloride RS in the *Standard solution* (μg/mL)  
 $C_U$  = nominal concentration of acebutolol in the *Sample solution* (μg/mL)  
 $M_{r1}$  = molecular weight of acebutolol, 336.43<sup>▲</sup><sub>USP40</sub>  
 $M_{r2}$  = molecular weight of acebutolol hydrochloride, 372.89

**Acceptance criteria:** NMT 0.5% of any individual impurity. Disregard any peaks from the *Diluent*.

**Test 2**

**Buffer and System suitability:** Proceed as directed in *Test 1*.

**Mobile phase:** Methanol and *Buffer* (50:50)

**Standard stock solution:** 0.6 mg/mL of USP

Acebutolol Hydrochloride RS prepared as follows. To a suitable amount of USP Acebutolol Hydrochloride RS in a suitable volumetric flask, add methanol, about 24% of the flask volume, swirl to dissolve, and dilute with *Mobile phase* to volume.

**Standard solution:** 1.4 μg/mL of USP Acebutolol Hydrochloride RS in *Mobile phase* from *Standard stock solution*

**Sample stock solution:** Nominally 2.5 mg/mL of acebutolol prepared as follows. Transfer a portion of the contents of 20 opened Capsules, equivalent to 250 mg of acebutolol, to a 100-mL volumetric flask. Add 25 mL of methanol and shake by mechanical means for 15 min. Dilute with *Mobile phase* to volume.

**Sample solution:** Nominally 250 μg/mL of acebutolol in *Diluent* from *Sample stock solution* prepared as follows. Centrifuge a portion of *Sample stock solution*, and transfer 10.0 mL of the clear supernatant to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.) Proceed as directed in *Test 1* except for the *Injection volume* and *Run time*.

**Injection volume:** 70 μL

**Run time:** NLT 3 times the retention time of acebutolol

**Analysis**

Samples: *Mobile phase*, *Standard solution*, and *Sample solution*

Calculate the percentage of each impurity eluting after the acebutolol peak in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of each individual impurity from the *Sample solution*  
 $r_S$  = peak response of acebutolol from the *Standard solution*  
 $C_S$  = concentration of USP Acebutolol Hydrochloride RS in the *Standard solution* (μg/mL)  
 $C_U$  = nominal concentration of acebutolol from the *Sample solution* (μg/mL)  
 $M_{r1}$  = molecular weight of acebutolol, 336.43<sup>▲</sup><sub>USP40</sub>  
 $M_{r2}$  = molecular weight of acebutolol hydrochloride, 372.89

**Acceptance criteria**

**Test 2:** NMT 0.5% of any individual impurity. Disregard any peaks from the *Mobile phase*.

**Sum of impurities from Test 1 and Test 2:** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
 USP Acebutolol Hydrochloride RS

## Acepromazine Maleate

$C_{19}H_{22}N_2O_5 \cdot C_4H_4O_4$  442.53  
 Ethanone, 1-[10-[3-(dimethylamino)propyl]-10H-phenothiazin-2-yl]-, (Z)-2-butenedioate (1:1);  
 10-[3-(Dimethylamino)propyl]phenothiazin-2-yl methyl ketone maleate (1:1) [3598-37-6].

**DEFINITION**

Acepromazine Maleate contains NLT 98.0% and NMT 101.0% of acepromazine maleate ( $C_{19}H_{22}N_2O_5 \cdot C_4H_4O_4$ ), calculated on the anhydrous basis.

Throughout the following procedures, protect samples, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak for acepromazine of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****PROCEDURE**

**Buffer:** Add 6 mL of triethylamine to 700 mL of water, and adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** Acetonitrile and *Buffer* (300:700)

**Standard stock solution:** 1 mg/mL of USP

Acepromazine Maleate RS in 0.05 N hydrochloric acid  
**Standard solution:** 0.1 mg/mL of USP Acepromazine Maleate RS in water from *Standard stock solution*

**Sample stock solution:** 1 mg/mL of Acepromazine Maleate in 0.05 N hydrochloric acid

**Sample solution:** 0.1 mg/mL of Acepromazine Maleate in water from *Sample stock solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4-mm × 15-cm; 5-μm packing L7

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acepromazine maleate ( $C_{19}H_{22}N_2OS \cdot C_4H_4O_4$ ) in the portion of Acepromazine Maleate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area response from the *Sample solution*

$r_S$  = peak area response from the *Standard solution*

$C_S$  = concentration of USP Acepromazine Maleate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–101.0% on the anhydrous basis

## IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.2%

• **ORGANIC IMPURITIES**

Conduct this test without exposure to daylight, and with the minimum necessary exposure to artificial light.

Diluent: Methanol and diethylamine (19:1)

Sample solution: 20.0 mg/mL of Acepromazine Maleate in Diluent

Standard solution: 0.1 mg/mL of Acepromazine Maleate in Diluent from the *Sample solution*

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μL

Developing solvent system: *n*-Heptane, isobutyl alcohol, and diethylamine (75:17:8)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths the length of the plate. Remove the plate from the chamber and allow to air dry. Examine the plate under short-wavelength UV light.

Acceptance criteria: 0.5%; no spot, other than the principal acepromazine spot and any at the origin, observed in the chromatogram of the *Sample solution* is more intense than the principal spot observed in the chromatogram of the *Standard solution*.

## SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 136°–139°

• **PH** (791)

Sample solution: 10 mg/mL of Acepromazine Maleate in water

Acceptance criteria: 4.0–5.5

• **WATER DETERMINATION, Method I** (921): NMT 1.0%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at room temperature.

• **LABELING:** Label it to indicate that it is for veterinary use only.

## • USP REFERENCE STANDARDS (11)

USP Acepromazine Maleate RS

## Acepromazine Maleate Injection

### DEFINITION

Acepromazine Maleate Injection is a sterile solution of Acepromazine Maleate in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of acepromazine maleate ( $C_{19}H_{22}N_2OS \cdot C_4H_4O_4$ ).

Throughout the following procedures, protect samples, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

### IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

Sample: To a volume of Injection, equivalent to 20 mg of acepromazine maleate, add 2 mL of water and 3 mL of 2 N sodium hydroxide, and extract with two 5-mL portions of cyclohexane. Combine the cyclohexane extracts, and evaporate to dryness under vacuum, using gentle heat if necessary.

Acceptance criteria: Meets the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

• **PROCEDURE**

Buffer: Add 6 mL of triethylamine to 700 mL of water, and adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and Buffer (300:700)

Standard stock solution: 1 mg/mL of USP

Acepromazine Maleate RS in 0.05 N hydrochloric acid

Standard solution: 0.1 mg/mL of USP Acepromazine Maleate RS in water from *Standard stock solution*

Sample stock solution: 1 mg/mL of Acepromazine Maleate in 0.05 N hydrochloric acid from an appropriately diluted volume of Injection

Sample solution: Nominally 0.1 mg/mL of Acepromazine Maleate in water from *Sample stock solution*

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 280 nm

Column: 4-mm × 15-cm; 5-μm packing L7

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acepromazine maleate ( $C_{19}H_{22}N_2OS \cdot C_4H_4O_4$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Acepromazine Maleate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

### SPECIFIC TESTS

- **pH (791):** 4.5–5.8
- **BACTERIAL ENDOTOXINS TEST (85):** NMT 4.5 USP Endotoxin Units/mg of acepromazine maleate
- **STERILITY TESTS (71):** It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products (1)*.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant, single-dose or multiple-dose containers as described in *Packaging and Storage Requirements (659)*, *Injection Packaging*. Store at controlled room temperature.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS (11)**  
USP Acepromazine Maleate RS  
USP Endotoxin RS

## Acepromazine Maleate Tablets

### DEFINITION

Acepromazine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acepromazine maleate ( $C_{19}H_{22}N_2O_5 \cdot C_4H_4O_4$ ).

Throughout the following procedures, protect samples, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**  
**Sample:** To a quantity of powdered Tablets, equivalent to 20 mg of acepromazine maleate, add 2 mL of water and 3 mL of 2 N sodium hydroxide, and extract with two 5-mL portions of cyclohexane. Combine the cyclohexane extracts, and evaporate to dryness under vacuum, using gentle heat if necessary.  
**Acceptance criteria:** Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

- **PROCEDURE**  
**Buffer:** Add 6 mL of triethylamine to 700 mL of water, and adjust with phosphoric acid to a pH of 2.5.  
**Mobile phase:** Acetonitrile and Buffer (300:700)  
**Standard stock solution:** 1 mg/mL of USP Acepromazine Maleate RS in 0.05 N hydrochloric acid  
**Standard solution:** 0.1 mg/mL of USP Acepromazine Maleate RS in water from *Standard stock solution*  
**Sample stock solution:** Transfer NLT 10 Tablets to a 200-mL volumetric flask, add 100 mL of 0.05 N hydrochloric acid, and sonicate for 10 min. Shake by mechanical means for 30 min, and dilute with 0.05 N hydrochloric acid to volume.  
**Sample solution:** Nominally 0.1 mg/mL of Acepromazine Maleate in water from *Sample stock solution*. Pass a portion of this solution through a filter of 0.5- $\mu$ m or finer pore size.

### Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4-mm  $\times$  15-cm; 5- $\mu$ m packing L7

Flow rate: 1 mL/min

Injection volume: 10  $\mu$ L

### System suitability

Sample: *Standard solution*

### Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acepromazine maleate ( $C_{19}H_{22}N_2O_5 \cdot C_4H_4O_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Acepromazine Maleate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **LABELING:** Label the Tablets to indicate that they are for veterinary use only.
- **USP REFERENCE STANDARDS (11)**  
USP Acepromazine Maleate RS

## Acetaminophen

$C_8H_9NO_2$

151.16

Acetamide, N-(4-hydroxyphenyl)-;  
4'-Hydroxyacetanilide [103-90-2].

### DEFINITION

Acetaminophen contains NLT 98.0% and NMT 102.0% of acetaminophen ( $C_8H_9NO_2$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

- **PROCEDURE**  
Use low-actinic glassware for preparation of the *Sample solution*.  
**Solution A:** 1.7 g/L of monobasic potassium phosphate and 1.8 g/L of dibasic sodium phosphate, anhydrous  
**Solution B:** Methanol  
**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	99	1
3.0	99	1
7.0	19	81

Table 1 (Continued)

Time (min)	Solution A (%)	Solution B (%)
7.1	99	1
10.0	99	1

**Standard solution:** 0.1 mg/mL of USP Acetaminophen RS in methanol

**Sample solution:** 0.1 mg/mL of Acetaminophen in methanol

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 10-cm; 3.5-μm packing L7

**Column temperature:** 35°

**Flow rate:** 1.0 mL/min

**Injection volume:** 5 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acetaminophen ( $C_6H_9NO_2$ ) in the portion of Acetaminophen taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Acetaminophen in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%

**Delete the following:**

- **HEAVY METALS, Method II** (231): NMT 10 ppm (Official 1: Jan-2018)

- **LIMIT OF FREE 4-AMINOPHENOL**

**Solution A, Solution B, Mobile phase, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 1.25 μg/mL of USP 4-Aminophenol RS in methanol

**Sample solution:** 25 mg/mL of Acetaminophen in methanol

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for 4-aminophenol and acetaminophen are 0.6 and 1.0, respectively.]

**Suitability requirements**

**Relative standard deviation:** NMT 5.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of 4-aminophenol in the portion of Acetaminophen taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of 4-aminophenol from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP 4-Aminophenol RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of Acetaminophen in the *Sample solution* (μg/mL)

**Acceptance criteria:** NMT 0.005%

• **ORGANIC IMPURITIES**

**Solution A:** Methanol, water, glacial acetic acid (50:950:1)

**Solution B:** Methanol, water, glacial acetic acid (500:500:1)

**Mobile phase:** See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	82	18
8	82	18
53	0	100
58	0	100
59	82	18
73	82	18

**Diluent:** Methanol

**System suitability solution:** 20 μg/mL of USP Acetaminophen RS and 80 μg/mL each of USP Acetaminophen Related Compound B RS and USP Acetaminophen Related Compound C RS in *Diluent*

**Standard solution:** 1.25 μg/mL of USP Acetaminophen Related Compound D RS and 0.25 μg/mL of USP Acetaminophen Related Compound J RS in *Diluent*

**Sample solution:** 25 mg/mL of Acetaminophen in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L7

**Flow rate:** 0.9 mL/min

**Column temperature:** 40°

**Injection volume:** 5 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 3* for relative retention time values.]

**Suitability requirements**

**Tailing factor:** NMT 2.0 for acetaminophen related compound D, *Standard solution*

**Resolution:** NLT 2.0 between acetaminophen and acetaminophen related compound B; NLT 1.5 between acetaminophen related compound B and acetaminophen related compound C, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for acetaminophen related compound D, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acetaminophen related compound J in the portion of Acetaminophen taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of acetaminophen related compound J from the *Sample solution*

$r_S$  = peak response of acetaminophen related compound J from the *Standard solution*

$C_S$  = concentration of USP Acetaminophen Related Compound J RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of Acetaminophen in the *Sample solution* (μg/mL)

Calculate the percentage of acetaminophen related compounds B, C, and D and any unspecified impurity in the portion of Acetaminophen taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- $r_U$  = peak response of each specified or unspecified impurity from the *Sample solution*  
 $r_S$  = peak response of acetaminophen related compound D from the *Standard solution*  
 $C_S$  = concentration of USP Acetaminophen Related Compound D RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Acetaminophen in the *Sample solution* ( $\mu\text{g/mL}$ )  
 $F$  = relative response factor for each impurity shown in Table 3

**Acceptance criteria:** See Table 3. [NOTE—The relative retention times and relative response factors in Table 3 (where applicable) are calculated relative to those of acetaminophen related compound D.]

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Acetaminophen	0.43	—	—
Acetaminophen related compound B <sup>a</sup>	0.67	1.2	0.05
Acetaminophen related compound C <sup>b</sup>	0.71	0.38	0.05
Acetaminophen related compound D <sup>c</sup>	1.0	1.0	0.05
Acetaminophen related compound J <sup>d</sup>	1.73	—	0.001
Individual unspecified impurity	—	1.0	0.05
Total impurities	—	—	0.1

<sup>a</sup> N-(4-Hydroxyphenyl)propanamide.

<sup>b</sup> N-(2-Hydroxyphenyl)acetamide.

<sup>c</sup> N-Phenylacetamide.

<sup>d</sup> N-(4-Chlorophenyl)acetamide (p-chloroacetanilide).

### SPECIFIC TESTS

#### • LOSS ON DRYING (731)

**Analysis:** Dry at 105° to constant weight.

**Acceptance criteria:** NMT 0.5%

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature. Protect from moisture and heat.

#### • USP REFERENCE STANDARDS (11)

USP Acetaminophen RS

## Acetaminophen Capsules

### DEFINITION

Acetaminophen Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ).

### IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Sample solution:** 1 mg/mL of acetaminophen prepared as follows. Triturate from contents of the Capsules in methanol. Filter, and use the clear filtrate.

**Chromatographic system**

**Developing solvent system:** Methylene chloride and methanol (4:1)

**Acceptance criteria:** Meet the requirements

### ASSAY

#### • PROCEDURE

**Mobile phase:** Methanol and water (1:3)

**Standard solution:** 0.01 mg/mL of USP Acetaminophen RS in *Mobile phase*

**Sample stock solution:** Weigh the contents of NLT 20 Capsules, and calculate the average weight of the contents of each Capsule. Mix the combined contents of the Capsules, and transfer a portion, equivalent to 100 mg of acetaminophen, to a 200-mL volumetric flask. Add 100 mL of *Mobile phase*, shake by mechanical means for 10 min, and dilute with *Mobile phase* to volume. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass a portion of this solution through a filter of 0.5- $\mu\text{m}$  or finer pore size, discarding the first 10 mL of the filtrate.

**Sample solution:** Nominally 0.01 mg/mL of acetaminophen from the *Sample stock solution* in *Mobile phase*. Pass a portion of this solution through a filter of 0.5- $\mu\text{m}$  or finer pore size, discarding the first 10 mL of the filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 243 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10  $\mu\text{L}$

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: A known concentration of USP Acetaminophen RS in Medium

Sample solution: A filtered portion of the solution under test, suitably diluted with Medium to obtain a concentration similar to that of the Standard solution

### Instrumental conditions

Mode: UV

Analytical wavelength: 249 nm

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

## IMPURITIES

### • 4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227): Meet the requirements

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in tight containers, and store at controlled room temperature.

### • USP REFERENCE STANDARDS (11)

USP Acetaminophen RS

## Acetaminophen Oral Solution

## DEFINITION

Acetaminophen Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

## IDENTIFICATION

### • A. The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

### • B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Sample solution: Nominally 1 mg/mL of acetaminophen in methanol from the Oral Solution

Chromatographic system

Developing solvent system: Methylene chloride and methanol (4:1)

Acceptance criteria: Meets the requirements

## ASSAY

### • PROCEDURE

Mobile phase: Methanol and water (1:3)

Standard solution: 0.01 mg/mL of USP Acetaminophen RS in Mobile phase

Sample stock solution: Nominally 2 mg/mL in Mobile phase, prepared as follows. Transfer 500 mg of acetaminophen from a measured volume of Oral Solution to a 250-mL volumetric flask, and dilute with Mobile phase to volume.

Sample solution: Nominally 0.01 mg/mL of acetaminophen in Mobile phase from the Sample stock solution. Pass a portion of this solution through a filter of 0.5- $\mu$ m or finer pore size, discarding the first 10 mL of the filtrate. Use the clear filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 243 nm

Column: 3.9-mm  $\times$  30-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 10  $\mu$ L

### System suitability

Sample: Standard solution

### Suitability requirements

Column efficiency: NLT 1000 theoretical plates

Tailing factor: NMT 2

Relative standard deviation: NMT 2.0%

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Acetaminophen RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acetaminophen in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DELIVERABLE VOLUME (698): Meets the requirements for oral solutions packaged in multiple-unit containers

### • UNIFORMITY OF DOSAGE UNITS (905): Meets the requirements for oral solutions packaged in single-unit containers

## IMPURITIES

### • 4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227): Meets the requirements

## SPECIFIC TESTS

### • pH (791): 3.8–6.1

### • ALCOHOL DETERMINATION, Method II (611) (if present)

Analysis: Determine by the gas-liquid chromatographic procedure, using acetone as the internal standard.

Acceptance criteria: 90.0%–115.0% of the labeled amount of alcohol ( $C_2H_5OH$ )

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in tight containers, and store at controlled room temperature.

### • USP REFERENCE STANDARDS (11)

USP Acetaminophen RS

## Acetaminophen for Effervescent Oral Solution

## DEFINITION

Acetaminophen for Effervescent Oral Solution contains, in each 100 g, NLT 5.63 g and NMT 6.88 g of acetaminophen ( $C_8H_9NO_2$ ).

## IDENTIFICATION

### • A. A 10-g portion dissolves, with effervescence, in water when dissolved as directed for the Sample solution in the Assay.

### • B. The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

### • C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Sample solution: Triturate 0.4 g of the powder with 25 mL of methanol, and filter.

**Chromatographic system**

Developing solvent system: Methylene chloride and methanol (4:1)

Acceptance criteria: Meets the requirements

**ASSAY****• PROCEDURE**

**Mobile phase:** Methanol and water (1:3)

**Standard solution:** 0.01 mg/mL of USP Acetaminophen RS in *Mobile phase*

**Sample stock solution:** Dissolve 10 g of Acetaminophen for Effervescent Oral Solution in 200 mL of water in a 1000-mL volumetric flask, using gentle heat if necessary, until effervescence subsides, and then dilute with water to volume.

**Sample solution:** Nominally 0.16 mg/mL of acetaminophen in *Mobile phase* from the *Sample stock solution*. Pass a portion of this solution through a filter of 0.5- $\mu$ m or finer pore size, discarding the first 10 mL of the filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 243 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in g, of acetaminophen ( $C_8H_9NO_2$ ) in 100 g of Acetaminophen for Effervescent Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F_1) \times L \times F_2$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)

$F_1$  = conversion factor, 1000 mg/g

$L$  = label claim (mg/unit)

$F_2$  = conversion factor, 100, based on the label claim of g of acetaminophen per 100 g of sample

Acceptance criteria: 5.63–6.88 g

**PERFORMANCE TESTS**

**• MINIMUM FILL (755):** Meets the requirements for solids packaged in multiple-unit containers

**• UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for solids packaged in single-unit containers

**IMPURITIES**

**• 4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227):** Meets the requirements

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Preserve in air-tight containers, and store at controlled room temperature.

- USP REFERENCE STANDARDS (11)**  
USP Acetaminophen RS

**Acetaminophen Suppositories****DEFINITION**

Acetaminophen Suppositories contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Sample solution:** Transfer the equivalent of 20 mg of acetaminophen from a portion of Suppositories to a beaker. Add 20 mL of methanol and heat on a steam bath until melted. Remove the beaker from the steam bath, allow to cool with occasional stirring, and filter. Use the clear filtrate.

**Chromatographic system**

Developing solvent system: Methylene chloride and methanol (4:1)

Acceptance criteria: Meet the requirements

**ASSAY****• PROCEDURE**

**Mobile phase:** Methanol and water (1:3)

**Standard solution:** 0.01 mg/mL of USP Acetaminophen RS in *Mobile phase*

**Sample stock solution:** Nominally 0.5 mg/mL of acetaminophen prepared as follows. Tare a small dish and a glass rod, place NLT 5 Suppositories in the dish, heat gently on a steam bath until melted, stir, cool while stirring, and weigh. Transfer a weighed portion of the mass, equivalent to 100 mg of acetaminophen, to a separator, add 30 mL of solvent hexane, and dissolve. Add 30 mL of water, shake gently, and allow the phases to separate. If an emulsion forms, allow sufficient time for it to separate. Transfer the aqueous layer to a 200-mL volumetric flask, and wash the solvent hexane in the separator with three 30-mL portions of water, adding the washings to the volumetric flask. Dilute with *Mobile phase* to volume.

**Sample solution:** Nominally 0.01 mg/mL of acetaminophen in *Mobile phase* from the *Sample stock solution*. Pass a portion of this solution through a filter of 0.5- $\mu$ m or finer pore size, discarding the first 10 mL of the filtrate. Use the clear filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 243 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Suppositories taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

- $r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

### IMPURITIES

#### • 4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227)

**Buffer:** 4.0 g/L of sodium citrate dihydrate and 1.5 g/L of anhydrous citric acid, in water

**Diluent:** *Buffer* and acetonitrile (9:1)

**Sample stock solution:** Approximately 12–13 mg/mL of acetaminophen prepared as follows. Transfer an appropriate number of whole Suppositories to a suitable volumetric flask. Add *Diluent* until the flask is about half filled and sonicate for 1 h with frequent swirling. Allow to cool and then dilute with *Diluent* to volume.

**Sample solution:** Approximately 4.8–5.2 mg/mL of acetaminophen in *Diluent* from the *Sample stock solution* prepared as follows. Pipet 20.0 mL of the *Sample stock solution* into a 50-mL volumetric flask and dilute with *Diluent* to volume.

**Standard stock solution:** Prepare as indicated in the chapter.

**Standard solution:** Add 20.0 mL of the *Sample stock solution* and 15.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Diluent* to volume.

Acceptance criteria: Meet the requirements

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature or in a cool place.
- **USP REFERENCE STANDARDS (11)**  
USP Acetaminophen RS

## Acetaminophen Oral Suspension

### DEFINITION

Acetaminophen Oral Suspension is a suspension of Acetaminophen in a suitable aqueous vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Sample:** Transfer a volume of Oral Suspension, equivalent to 240 mg of acetaminophen, to a separator. Add 50 mL of ethyl acetate, and shake. Filter the ethyl acetate extract through a funnel containing glass wool and 10 g of anhydrous sodium sulfate. Collect the filtrate in a beaker, and evaporate on a steam bath to dryness. Dry the residue under vacuum over silica gel.

Acceptance criteria: The crystals so obtained meet the requirements.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Methanol and water (1:3)

**Standard solution:** 0.01 mg/mL of USP Acetaminophen RS in *Mobile phase*

**Sample stock solution:** Nominally 0.5 mg/mL of acetaminophen prepared as follows. Transfer 100 mg of acetaminophen from a volume of Oral Suspension, previously well shaken, to a 200-mL volumetric flask. Add 100 mL of *Mobile phase*, and shake by mechanical means for 10 min. Dilute with *Mobile phase* to volume.

**Sample solution:** Nominally 0.01 mg/mL of acetaminophen from the *Sample stock solution* in *Mobile phase*.

Pass a portion of this solution through a filter of 0.5- $\mu$ m pore size or finer, discarding the first 10 mL of the filtrate. Use the clear filtrate.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 243 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for oral suspensions packaged in single-unit containers
- **DELIVERABLE VOLUME (698):** Meets the requirements for oral suspensions packaged in multiple-unit containers

### IMPURITIES

- **4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227):** Meets the requirements

### SPECIFIC TESTS

- **pH (791):** 4.0–6.9

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Acetaminophen RS  
USP 4-Aminophenol RS

## Acetaminophen Tablets

### DEFINITION

Acetaminophen Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Sample solution:** Nominally 1 mg/mL of acetaminophen prepared as follows. Triturate 50 mg of acetaminophen from powdered Tablets in 50 mL of methanol, and filter. Use the clear filtrate.

### Chromatographic system

**Developing solvent system:** Methylene chloride and methanol (4:1)

Acceptance criteria: Meet the requirements

## ASSAY

### PROCEDURE

Mobile phase: Methanol and water (1:3)

Standard solution: 0.01 mg/mL of USP Acetaminophen RS in Mobile phase

Sample stock solution: Nominally 0.5 mg/mL of acetaminophen prepared as follows. Weigh, and finely powder NLT 20 Tablets. Transfer 100 mg of acetaminophen from a portion of powdered Tablets to a 200-mL volumetric flask, add 100 mL of Mobile phase, shake by mechanical means for 10 min, sonicate for 5 min, and dilute with Mobile phase to volume.

Sample solution: Nominally 0.01 mg/mL of acetaminophen in Mobile phase from the Sample stock solution. Pass a portion of this solution through a filter of 0.5- $\mu$ m or finer pore size, discarding the first 10 mL of the filtrate. Use the clear filtrate.

### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 243 nm

Column: 3.9-mm  $\times$  30-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 10  $\mu$ L

### System suitability

Sample: Standard solution

### Suitability requirements

Column efficiency: NLT 1000 theoretical plates

Tailing factor: NMT 2

Relative standard deviation: NMT 2.0%

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Acetaminophen RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acetaminophen in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### DISSOLUTION (711)

Medium: pH 5.8 phosphate buffer (see Reagents, Indicators, and Solutions—Buffer Solutions); 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: A known concentration of USP Acetaminophen RS in Medium

Sample solution: A filtered portion of the solution under test, suitability diluted with Medium to obtain a concentration similar to that of the Standard solution

### Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 243 nm

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) is dissolved.

### For Tablets labeled as chewable

Medium: pH 5.8 phosphate buffer (see Reagents, Indicators, and Solutions—Buffer Solutions); 900 mL

Apparatus 2: 75 rpm

Time: 45 min

Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed above.

Tolerances: NLT 75% (Q) of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

- **4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227):** Meet the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Label Tablets that must be chewed to indicate that they are to be chewed before swallowing.
- **USP REFERENCE STANDARDS (11)**  
USP Acetaminophen RS

## Acetaminophen Extended-Release Tablets

### DEFINITION

Acetaminophen Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

Sample: A portion of powdered Tablets

Acceptance criteria: Meet the requirements

- **B.** The retention time of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

## ASSAY

### PROCEDURE

Solution A: Phosphoric acid and water (1:9)

Mobile phase: Methanol, Solution A, and water (300:1:700)

Standard solution: 0.65 mg/mL of USP Acetaminophen RS in Mobile phase. Prepare by first dissolving in methanol, and then diluting with Mobile phase to volume.

Sample stock solution: Transfer 10 Tablets to a 250-mL volumetric flask containing 50 mL of water and a magnetic stir bar. Stir for at least 30 min or until the coating has dissolved. Add 150 mL of methanol, and stir for 45 min. Tablet cores should be disintegrated at least 15 min before ending the stirring. Remove the magnetic stir bar, and rinse into the flask with methanol. Dilute with methanol to volume, and centrifuge. Use the clear supernatant.

Sample solution: Dilute 5 mL of the Sample stock solution with Mobile phase to 200 mL.

### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 295 nm

Column: 3.9-mm  $\times$  15-cm; packing L1

Flow rate: 2.0 mL/min

Injection volume: 20  $\mu$ L

### System suitability

Sample: Standard solution

### Suitability requirements

Tailing factor: NMT 3.0

Relative standard deviation: NMT 2.0%

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

- $C_s$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)  
 Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS**• **DISSOLUTION** (711)**Test 1**

**Medium:** Simulated gastric fluid TS (without enzyme); 900 mL

**Apparatus 2:** 50 rpm

**Times:** 15 min, 1 h, and 3 h

**Standard solution:** A known concentration of USP Acetaminophen RS in *Medium*

**Sample solution:** A filtered portion of the solution under test, suitably diluted with *Medium* to obtain a concentration similar to that of the *Standard solution*

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** 280 nm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved.

**Tolerances:** See *Table 1*.

**Table 1**

Time	Amount Dissolved
15 min	45%–65%
1 h	60%–85%
3 h	NLT 85%

The percentages of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved at the times specified conform to *Acceptance Table 2* in (711).

**For gelatin-coated Tablets**

**Medium, Apparatus, Standard solution, Sample solution, Instrumental conditions, and Analysis:** Proceed as directed in *Test 1*.

**Times:** 30 min, 90 min, and 4 h

**Tolerances:** See *Table 2*.

**Table 2**

Time	Amount Dissolved
30 min	40%–60%
90 min	55%–85%
4 h	NLT 80%

The percentages of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved at the times specified conform to *Acceptance Table 2* in (711).

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium, Apparatus, Standard solution, Sample solution, Instrumental conditions, and Analysis:** Proceed as directed in *Test 1*.

**Times:** 15 min, 1 h, and 3 h

**Tolerances:** See *Table 3*.

**Table 3**

Time	Amount Dissolved
15 min	40%–60%
1 h	55%–75%
3 h	NLT 80%

The percentages of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved at the times specified conform to *Acceptance Table 2* in (711).

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**IMPURITIES**

- **4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS** (227): Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where the Tablets are gelatin-coated, the label so states. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)  
 USP Acetaminophen RS

**Acetaminophen and Aspirin Tablets**

» Acetaminophen and Aspirin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—The relative retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution, Procedure for a Pooled Sample** (711)—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Mobile phase**—Prepare as directed under *Assay*.

**Solvent mixture**—Prepare as directed under *Assay*.

**Internal standard solution**—Prepare a solution of benzoic acid in methanol having a concentration of about 1 mg per mL.

**Standard preparation I**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Solvent mixture* to obtain a solution having a known concentration of about 70  $\mu$ g per mL. Combine 4.0 mL of this solution and 1.0 mL of the *Internal standard solution*, and mix.

**Standard preparation II**—Dissolve accurately weighed quantities of USP Acetaminophen RS and USP Aspirin RS in the *Solvent mixture* to obtain a solution having known concentrations of about 360  $\mu$ g of acetaminophen and about 360  $\mu$ g of aspirin per mL. Combine 4.0 mL of this solution and 1.0 mL of the *Internal standard solution*, and mix.

**Test preparation**—Combine 4.0 mL of a filtered portion of the solution under test and 1.0 mL of the *Internal standard solution*, and mix.

**Chromatographic system**—Proceed as directed under *Assay*.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the two *Standard preparations* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.3 for acetaminophen, 0.4 for salicylic acid, 0.6 for aspirin, and 1.0 for benzoic acid. Deter-

mine the amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved by the formula:

$$90(C/W)(R_U / R_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Acetaminophen RS in *Standard preparation II*;  $R_U$  and  $R_S$  are the relative peak response ratios obtained from the *Test preparation* and *Standard preparation II*, respectively; and W is the labeled amount, in mg, of acetaminophen. Determine the amount of aspirin ( $C_9H_8O_4$ ) dissolved by the formula:

$$\{[90C_1(R_{U1} / R_{S1})] + [90C_2(R_{U2} / R_{S2})(1.3044)]\} / W$$

in which  $C_1$  and  $C_2$  are the concentrations, in  $\mu\text{g}$  per mL, of USP Aspirin RS in *Standard preparation II* and USP Salicylic Acid RS in *Standard preparation I*, respectively;  $R_{U1}$  and  $R_{S1}$  are the relative peak response ratios for the aspirin peak and the internal standard peak obtained from the *Test preparation* and *Standard preparation II*, respectively;  $R_{U2}$  and  $R_{S2}$  are the relative peak response ratios for the salicylic acid peak and the internal standard peak obtained from the *Test preparation* and *Standard preparation I*, respectively; and W is the labeled amount, in mg, of aspirin.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $C_8H_9NO_2$  and  $C_9H_8O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to acetaminophen and to aspirin.

#### Limit of salicylic acid—

**Solvent mixture, Mobile phase, Internal standard solution, and Chromatographic system**—Prepare as directed in the Assay.

**Procedure**—Dissolve a suitable quantity of USP Salicylic Acid RS, accurately weighed, in *Solvent mixture* to obtain a solution having a known concentration of about 1.0 mg per mL. Transfer 1.0-mL, 5.0-mL, and 10.0-mL portions, respectively, of this solution to separate 100-mL volumetric flasks, add 10.0 mL of *Internal standard solution* to each flask, dilute with *Solvent mixture* to volume, and mix. Chromatograph these three Standard solutions as directed in the Assay. Plot the ratios of the peak responses for salicylic acid and benzoic acid for each of the Standard solutions versus concentrations, in mg per mL, of salicylic acid, and draw the straight line best fitting the three plotted points. From the graph so obtained, and from the ratio of the peak responses for salicylic acid and benzoic acid in the chromatogram of the *Assay preparation* as obtained in the Assay, determine the concentration, in mg per mL, of salicylic acid ( $C_7H_6O_3$ ) in the *Assay preparation*, and calculate the percentage of salicylic acid in relation to the concentration of aspirin in the *Assay preparation*, as determined in the Assay. Not more than 3.0% is found.

**Assay**—[NOTE—Use clean, dry glassware. Inject the *Standard preparation* and the *Assay preparation* promptly after preparation.]

**Solvent mixture**—Prepare a mixture of chloroform, methanol, and glacial acetic acid (78:20:2).

**Mobile phase**—Transfer 225 mg of tetramethylammonium hydroxide pentahydrate to a 1000-mL flask, and add 750 mL of water, 125 mL of methanol, 125 mL of acetonitrile, and 1.0 mL of glacial acetic acid. Stir for 3 minutes, pass through a membrane filter having a 0.5- $\mu\text{m}$  or finer porosity, and degas.

**Internal standard solution**—Dissolve benzoic acid in *Solvent mixture* to obtain a solution having a concentration of about 20 mg per mL.

**Standard preparation**—Transfer about 325 mg of USP Acetaminophen RS and about 325 mg of USP Aspirin RS, each accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of acetaminophen, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution* and about 50 mL of *Solvent mixture*, and sonicate for about 3 minutes. Dilute with *Solvent mixture* to volume, and mix. Pass a portion of this solution through a filter having a 2.5- $\mu\text{m}$  or finer porosity, and use the filtrate as the *Assay preparation*.

**Chromatographic system**—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph four replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for either analyte is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention times are about 2, 3, 5, and 8 minutes for acetaminophen, salicylic acid (if present), aspirin, and benzoic acid, respectively. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of acetaminophen and benzoic acid obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the same formula, except to read "USP Aspirin RS" where "USP Acetaminophen RS" is specified, and "aspirin" where "acetaminophen" is specified.

## Acetaminophen, Aspirin, and Caffeine Tablets

» Acetaminophen, Aspirin, and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), aspirin ( $C_9H_8O_4$ ), and caffeine ( $C_8H_{10}N_4O_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Acetaminophen RS  
USP Aspirin RS  
USP Caffeine RS  
USP Salicylic Acid RS

**Identification**—The relative retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the Assay.

#### Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 100 rpm.

Time: 60 minutes.

**Mobile phase, Internal standard solution, Solvent mixture, Standard stock solution, and Chromatographic system**—Proceed as directed in the Assay.

**Standard preparation**—Transfer 20.0 mL of *Standard stock solution*, 3.0 mL of *Internal standard solution*, and 20 mL of water to a 50-mL volumetric flask, mix, and allow to stand

for about 30 seconds. Dilute with *Solvent mixture* to volume, and mix. Use within 8 hours.

**Test preparation**—Transfer 20.0 mL of a filtered portion of the solution under test to a 50-mL volumetric flask, add 3.0 mL of *Internal standard solution* and 20 mL of *Solvent mixture*, mix, and allow to stand for 30 seconds. Dilute with *Solvent mixture* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*. Calculate the quantities, in mg, of acetaminophen ( $C_8H_9NO_2$ ), aspirin ( $C_9H_8O_4$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) dissolved by the formula:

$$2250C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the corresponding analyte and internal standard peaks of the solution under test and the *Standard preparation*, respectively.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amounts of  $C_8H_9NO_2$ ,  $C_9H_8O_4$ , and  $C_8H_{10}N_4O_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to acetaminophen, aspirin, and caffeine.

#### Limit of salicylic acid—

**Mobile phase and Solvent mixture**—Prepare as directed in the *Assay*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Solvent mixture* to obtain a solution having a known concentration of about 1 mg per mL. Transfer 2.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. This solution contains about 0.02 mg of USP Salicylic Acid RS per mL.

**Test preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of aspirin, to a 100-mL volumetric flask. Add about 75 mL of *Solvent mixture*, and shake by mechanical means for 30 minutes. Dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system**—Proceed as directed for *Chromatographic system* in the *Assay*, except to use a 302-nm detector. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor is not more than 1.6; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the salicylic acid peaks. Calculate the percentage of salicylic acid in the portion of Tablets taken by the formula:

$$10,000(C/a)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*;  $a$  is the quantity, in mg, of aspirin in the portion of Tablets taken, based on the labeled amount; and  $r_U$  and  $r_S$  are the salicylic acid peak responses of the *Test preparation* and the *Standard preparation*, respectively: not more than 3.0% is found.

#### Assay—

**Mobile phase**—Prepare a suitable mixture of water, methanol, and glacial acetic acid (69:28:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of benzoic acid in methanol containing about 6 mg per mL.

**Solvent mixture**—Prepare a mixture of methanol and glacial acetic acid (95:5).

**Standard stock solution**—Dissolve accurately weighed quantities of USP Acetaminophen RS, USP Aspirin RS, and USP Caffeine RS in *Solvent mixture* to obtain a solution having known concentrations of about 0.25 mg of USP Acetaminophen RS per mL, 0.25/ $j$  mg of USP Aspirin RS per mL, and 0.25/ $j'$  mg of USP Caffeine RS per mL,  $j$  being the ratio of the labeled amount, in mg, of aspirin to the labeled amount, in mg, of acetaminophen per Tablet; and  $j'$  being the ratio of the labeled amount, in mg, of caffeine to the labeled amount, in mg, of acetaminophen per Tablet.

**Standard preparation**—Transfer 20.0 mL of *Standard stock solution* and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. This solution contains about 0.1 mg of USP Acetaminophen RS, 0.1/ $j$  mg of USP Aspirin RS, and 0.1/ $j'$  mg of USP Caffeine RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of acetaminophen, to a 100-mL volumetric flask. Add about 75 mL of *Solvent mixture*, and shake by mechanical means for 30 minutes. Dilute with *Solvent mixture* to volume, and mix. Transfer 2.0 mL of this solution and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system**—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm  $\times$  10-cm column that contains 5- $\mu$ m packing L1, and is maintained at  $45 \pm 1^\circ$ . The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for each analyte peak is not more than 1.2; the resolution,  $R$ , between any of the analyte and internal standard peaks is not less than 1.4; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.3 for acetaminophen, 0.5 for caffeine, 0.8 for aspirin, 1.0 for benzoic acid, and 1.2 for salicylic acid. Calculate the quantities, in mg, of acetaminophen ( $C_8H_9NO_2$ ), aspirin ( $C_9H_8O_4$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) in the portion of Tablets taken by the formula:

$$2500C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the corresponding analyte and internal standard peaks of the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Caffeine Tablets

### DEFINITION

Acetaminophen and Caffeine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and caffeine ( $C_8H_{10}N_4O_2$ ).

### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, relative to the internal standard, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** Methanol and glacial acetic acid (95:5)

**Mobile phase:** Methanol, glacial acetic acid, and water (28:3:69)

**Internal standard solution:** 6 mg/mL of benzoic acid in methanol

**Standard stock solution:** 0.25 mg/mL of USP Acetaminophen RS and 0.25/ mg/mL of USP Caffeine RS in *Solution A*; *J* being the ratio of the labeled amount, in mg, of caffeine to the labeled amount, in mg, of acetaminophen per Tablet

**Standard solution:** 0.1 mg/mL of USP Acetaminophen RS and 0.1/ mg/mL of USP Caffeine RS, prepared by transferring 20.0 mL of *Standard stock solution* and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and diluting with *Solution A* to volume

**Sample stock solution:** Nominally 2.5 mg/mL of acetaminophen in *Solution A*, prepared as follows. Transfer a portion of the powder equivalent to 250 mg of acetaminophen, from NLT 20 finely powdered Tablets, to a 100-mL volumetric flask. Add 75 mL of *Solution A*, and shake by mechanical means for 30 min. Dilute with *Solution A* to volume.

**Sample solution:** Transfer 2.0 mL of the *Sample stock solution* and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Solution A* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 275 nm

**Column:** 4.6-mm × 10-cm; 5-μm packing L1

**Column temperature:** 45 ± 1°

**Flow rate:** 2 mL/min

**Injection volume:** 10 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen, caffeine, and benzoic acid are about 0.3, 0.5, and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.4 between any of the analyte and internal standard peaks

**Tailing factor:** NMT 1.2 for each analyte peak

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate individually the percentages of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

*R<sub>U</sub>* = peak response ratio of acetaminophen or caffeine to the internal standard from the *Sample solution*

*R<sub>S</sub>* = peak response ratio of acetaminophen or caffeine to the internal standard from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Acetaminophen RS or USP Caffeine RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of acetaminophen or caffeine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>)

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 100 rpm

**Time:** 60 min

**Solution A, Mobile phase, Internal standard solution, Standard stock solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** Transfer 20.0 mL of the *Standard stock solution*, 3.0 mL of *Internal standard solution*, and 20 mL of water to a 50-mL volumetric flask, and allow

to stand for 30 s. Dilute with *Solution A* to volume. Use within 8 h.

**Sample solution:** Transfer an aliquot of a filtered portion of the solution under test to a 50-mL volumetric flask to obtain an expected concentration of 0.1 mg/mL of acetaminophen and 0.1/ mg/mL of caffeine, where *J* is defined for the *Standard stock solution*. Add 3.0 mL of *Internal standard solution* and 20 mL of *Solution A*, and allow to stand for 30 s. Dilute with *Solution A* to volume.

**Analysis:** Proceed as directed in the *Assay*, using the *Standard solution* and *Sample solution* prepared within the *Dissolution* test.

Calculate the percentages of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) dissolved:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

*R<sub>U</sub>* = peak response ratio of acetaminophen or caffeine to the internal standard from the *Sample solution*

*R<sub>S</sub>* = peak response ratio of acetaminophen or caffeine to the internal standard from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Acetaminophen RS or USP Caffeine RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of acetaminophen or caffeine in the *Sample solution* (mg/mL)

**Tolerances:** NLT 75% (*Q*) of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

- **4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227):** Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Acetaminophen RS  
USP Caffeine RS

### Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

» Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>), chlorpheniramine maleate (C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>), dextromethorphan hydrobromide (C<sub>18</sub>H<sub>25</sub>NO · HBr · H<sub>2</sub>O), and pseudoephedrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO · HCl) or pseudoephedrine sulfate [(C<sub>10</sub>H<sub>15</sub>NO)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>].  
NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The

name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS  
USP Dextromethorphan Hydrobromide RS  
USP Pseudoephedrine Hydrochloride RS  
USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients contained in the article. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

**Identification**—

**A:** If pseudoephedrine hydrochloride or pseudoephedrine sulfate is purported to be present, the retention time of the major peak for pseudoephedrine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*.

**B:** If acetaminophen is claimed in the labeling to be present, the retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the retention time of the major peak for chlorpheniramine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the retention time of the major peak for dextromethorphan in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

**Dissolution, Procedure for a Pooled Sample** (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

**Test preparation**—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

**Procedure**—Determine the amounts of pseudoephedrine hydrochloride or pseudoephedrine sulfate (as appropriate), acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for pseudoephedrine hydrochloride* or *Assay for pseudoephedrine sulfate*, *Assay for acetaminophen*, *Assay for chlorpheniramine maleate*, and *Assay for dextromethorphan hydrobromide*, respectively, making any necessary volumetric adjustments.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ], acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**System suitability solution 1** (for Capsules that contain either all four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Capsules that contain no chlorpheniramine)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with water to obtain a solution having a concentration of about 0.12 mg of pseudoephedrine hydrochloride per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the Capsules taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; L is the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Capsule; D is the concentration, in mg per mL, of pseudoephedrine hydrochloride in the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Capsule and the extent of dilution; and  $r_U$  and  $r_S$  are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

**Mobile phase, System suitability solutions, and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

**Assay preparation**—Proceed as directed for the *Assay preparation* in the *Assay for pseudoephedrine hydrochloride* to ob-

tain a solution having a concentration of about 0.24 mg of pseudoephedrine sulfate per mL.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for pseudoephedrine hydrochloride*. Calculate the quantity, in mg, of pseudoephedrine sulfate  $[(C_{10}H_{15}NO)_2 \cdot H_2SO_4]$  in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

**Assay for acetaminophen (if present)**—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79:20:1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 25 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until solution is complete. Add 0.2 mL of phosphoric acid, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.25 mg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.25 mg of acetaminophen per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; L is the labeled quantity, in mg, of acetaminophen in each Capsule; D is the concentration, in mg per mL, of acetaminophen in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of acetaminophen in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following*—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8  $\mu$ g per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about

100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 8  $\mu$ g of chlorpheniramine maleate per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; L is the labeled quantity, in mg, of chlorpheniramine maleate in each Capsule; D is the concentration, in mg per mL, of chlorpheniramine maleate in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of chlorpheniramine maleate in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following*—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.4 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.04 mg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.04 mg of dextromethorphan hydrobromide per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each Capsule taken by the formula:

$$(370.33/352.32)(CL/D)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; L is the labeled quantity, in mg, of dextromethorphan hydrobromide in each Capsule; D is the concentration, in mg per mL, of dextromethorphan hydrobromide in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of dextromethorphan hydrobromide in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Oral Powder Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

» Oral Powder Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate ( $[C_{10}H_{15}NO]_2 \cdot H_2SO_4$ ).

NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS  
USP Dextromethorphan Hydrobromide RS  
USP Pseudoephedrine Hydrochloride RS  
USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

### Identification—

**A:** If pseudoephedrine hydrochloride or pseudoephedrine sulfate is claimed in the labeling to be present, the retention time of the major peak for pseudoephedrine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*.

**B:** If acetaminophen is claimed in the labeling to be present, the retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the retention time of the major peak for chlorpheniramine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the retention time of the major peak for dextromethorphan in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

**Minimum fill (755):** meets the requirements.

### Uniformity of dosage units (905)—

FOR ORAL POWDER PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

*Chlorpheniramine standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

*Dextromethorphan standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, dilute with 0.1% phosphoric acid to volume, and mix.

*System suitability solution 1* (for Oral Powder that contains either all four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

*System suitability solution 2* (for Oral Powder that contains no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

*Assay preparation*—Transfer the contents of 10 unit-dose containers of the Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2.0 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.24 mg of pseudoephedrine hydrochloride per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ), in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; L is the labeled quantity, in mg, of pseudoephedrine hydrochloride in each unit-dose container; D is the concentration, in mg per mL, of pseudoephedrine hydrochloride in each mL of the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of pseudoephedrine hydrochloride in each unit-dose container, and the extent of dilution; and  $r_U$  and  $r_S$  are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the Assay for chlorpheniramine maleate.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the Assay for dextromethorphan hydrobromide.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 6.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, dilute with 0.1% phosphoric acid to volume, and mix.

**System suitability solution 1** (for Oral Powder that contains either all four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Oral Powder that contains no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Proceed as directed for the Assay preparation in the Assay for pseudoephedrine hydrochloride to obtain a solution having a concentration of about 0.48 mg of pseudoephedrine sulfate per mL.

**Procedure**—Proceed as directed for *Procedure* in the Assay for pseudoephedrine hydrochloride. Calculate the quantity, in mg, of pseudoephedrine sulfate  $[(C_{10}H_{15}NO)_2 \cdot H_2SO_4]$  in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

#### Assay for acetaminophen (if present)—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Assay preparation**—Transfer the contents of 10 unit-dose containers of the Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.50 mg of acetaminophen per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; L is the labeled quantity, in mg, of acetaminophen in each unit-dose container; D is the concentration, in mg per mL, of acetaminophen in the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of acetaminophen in each unit-dose container, and the extent of dilution; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for chlorpheniramine maleate (if present)—

**Mobile phase and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8  $\mu$ g per mL.

**Assay preparation**—Transfer the contents of 10 unit-dose containers of Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of 8  $\mu$ g of chlorpheniramine maleate per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; L is the labeled quantity, in mg, of chlorpheniramine maleate in each unit-dose container; D is the concentration, in mg per mL, of chlorpheniramine maleate in each mL of the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of chlorpheniramine maleate in each unit-dose container, and the extent of dilution; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for dextromethorphan hydrobromide (if present)—

**Mobile phase and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of 0.08 mg per mL.

**Assay preparation**—Transfer the contents of 10 unit-dose containers of Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. If necessary, quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a concentration of 0.08 mg of dextromethorphan hydrobromide per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan

hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each unit-dose container of Oral Powder taken by the formula:

$$(370.33/352.32)(CL/D)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively;  $C$  is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of dextromethorphan hydrobromide in each unit-dose container;  $D$  is the concentration, in mg per mL, of dextromethorphan hydrobromide in each mL of the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of dextromethorphan hydrobromide in each unit-dose container, and the extent of dilution; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Oral Solution Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

» Oral Solution Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ].

NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS  
USP Dextromethorphan Hydrobromide RS  
USP Pseudoephedrine Hydrochloride RS  
USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

#### Identification—

A: If pseudoephedrine hydrochloride or pseudoephedrine sulfate is claimed in the labeling to be present, the retention time of the major peak for pseudoephedrine in the chromat-

ogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*.

B: If acetaminophen is claimed in the labeling to be present, the retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

C: If chlorpheniramine maleate is claimed in the labeling to be present, the retention time of the major peak for chlorpheniramine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

D: If dextromethorphan hydrobromide is claimed in the labeling to be present, the retention time of the major peak for dextromethorphan in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

#### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

#### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.7 and 7.5.

**Alcohol Determination, Method II** (611) (if present): between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

**Microbial enumeration tests (61) and Absence of specified microorganisms (62)**—The total bacterial count does not exceed 100 cfu per g, the total combined molds and yeasts count does not exceed 10 cfu per g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.15 g of triethylamine hydrochloride, 0.25 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 1.5 mg per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, add 8.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**System suitability solution 1** (for Oral Solution that contains either all the four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Oral Solution that contains no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Transfer an accurately measured volume of the Oral Solution, equivalent to 15 mg of pseudoephedrine hydrochloride, to a 100-mL volumetric flask, add

80.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the pseudoephedrine peak is not greater than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%. Separately inject about 10  $\mu$ L of *System suitability solution 1* or *System suitability solution 2*, as appropriate. The resolution, *R*, between pseudoephedrine and chlorpheniramine or between pseudoephedrine and dextromethorphan is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of the Oral Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

**Mobile phase, System suitability solutions, and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, add 4.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to 30 mg of pseudoephedrine sulfate, to a 100-mL volumetric flask, add 80.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for pseudoephedrine hydrochloride*. Calculate the quantity, in mg, of pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ] in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

**Assay for acetaminophen (if present)**—

**Mobile phase**—Prepare a suitable degassed and filtered mixture of water, methanol, and glacial acetic acid (79:20:1). Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 16.5 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 2.5 mL of methanol, and mix until solution is complete. Dilute with water to volume, and mix to obtain

a solution having a known concentration of about 0.165 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 33 mg of acetaminophen, to a 200-mL volumetric flask, add 5 mL of methanol, and mix. Dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each mL of the Oral Solution taken by the formula:

$$200(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; *V* is the volume, in mL, of the Oral Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 1 mg per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 1 mg of chlorpheniramine maleate, to a 100-mL volumetric flask. Add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; *V* is the volume, in mL, of the Oral Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 1.5 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 7.5 mg of dextromethorphan hydrobromide, to a 100-mL volumetric flask,

add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each mL of the Oral Solution taken by the formula:

$$(370.33/352.32)(100C/V)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; V is the volume, in mL, of the Oral Solution taken; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

» Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ]. NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS  
USP Dextromethorphan Hydrobromide RS  
USP Pseudoephedrine Hydrochloride RS  
USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

#### Identification—

A: If pseudoephedrine hydrochloride or pseudoephedrine sulfate is claimed in the labeling to be present, the chromat-

ogram of the *Assay preparation*, obtained as directed in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*, exhibits a major peak for pseudoephedrine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

B: If acetaminophen is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for acetaminophen*, exhibits a major peak for acetaminophen, the retention time of which corresponds to that exhibited by the *Standard preparation*.

C: If chlorpheniramine maleate is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for chlorpheniramine maleate*, exhibits a major peak for chlorpheniramine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

D: If dextromethorphan hydrobromide is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for dextromethorphan hydrobromide*, exhibits a major peak for dextromethorphan, the retention time of which corresponds to that exhibited by the *Standard preparation*.

#### Dissolution, Procedure for a Pooled Sample (711)—

##### TEST 1—

**Medium:** pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Test preparation**—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

**Procedure**—Determine the amounts of pseudoephedrine hydrochloride or pseudoephedrine sulfate (as appropriate), acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for pseudoephedrine hydrochloride* or *Assay for pseudoephedrine sulfate*, *Assay for acetaminophen*, *Assay for chlorpheniramine maleate*, and *Assay for dextromethorphan hydrobromide*, respectively, making any necessary volumetric adjustments.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ], acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) are dissolved in 45 minutes.

**TEST 2**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** water; 900 mL.

**Apparatus, Time, Test preparation, Procedure, and Tolerances**—Proceed as directed for *Test 1*.

**Uniformity of dosage units (905):** meet the requirements.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.3 g of triethylamine hydrochloride, 0.15 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 1.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

**Chlorpheniramine standard preparation**—Prepare as directed for the *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for the *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**System suitability solution 1** (for Tablets that contain either all the four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Tablets that contain no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 6 mg of pseudoephedrine hydrochloride, to a 50-mL volumetric flask. Add 5 mL of methanol, and sonicate to disperse the powder. Dilute with 0.1% phosphoric acid to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the pseudoephedrine peak is not greater than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%. Separately inject about 10 µL of *System suitability solution 1* or *System suitability solution 2*, as appropriate. The resolution, *R*, between pseudoephedrine and chlorpheniramine or between pseudoephedrine and dextromethorphan is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$50C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*, and *r<sub>u</sub>* and *r<sub>s</sub>* are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

**Mobile phase, Chlorpheniramine standard preparation, Dextromethorphan standard preparation, System suitability solutions, and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 12 mg of pseudoephedrine sulfate, to a 50-mL volumetric flask. Add 5 mL of methanol, and sonicate to disperse the powder. Dilute with 0.1% phosphoric acid to volume, mix, and filter.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for pseudoephedrine hydrochloride*. Calculate the quantity, in

mg, of pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ] in the portion of Tablets taken by the formula:

$$50C(r_u / r_s)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

**Assay for acetaminophen (if present)**—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79:20:1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 50 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until solution is complete. Dilute with 0.1% phosphoric acid to volume, and mix.

**Assay preparation**—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of acetaminophen, to a 50-mL volumetric flask. Add about 7.5 mL of methanol, and sonicate to disperse the powder. Add 0.5 mL of phosphoric acid, dilute with water to volume, mix, and filter. Transfer 25.0 mL of the filtered solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$200C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8 µg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg of chlorpheniramine maleate, to a 250-mL volumetric flask. Add 25 mL of methanol, and sonicate to disperse the powder. Add 1 mL of phosphoric acid, dilute with water to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate

( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Tablets taken by the formula:

$$250C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for chlorpheniramine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)**—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.6 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.06 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 mg of dextromethorphan hydrobromide, to a 100-mL volumetric flask. Add 10 mL of methanol, and sonicate to disperse the powder. Add 0.4 mL of phosphoric acid, dilute with water to volume, mix, and filter.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in the portion of Tablets taken by the formula:

$$(370.33 / 352.32)(100C)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively;  $C$  is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen, Chlorpheniramine Maleate, and Dextromethorphan Hydrobromide Tablets

### DEFINITION

Acetaminophen, Chlorpheniramine Maleate, and Dextromethorphan Hydrobromide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide monohydrate ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak for acetaminophen of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Acetaminophen*.
- **B.** The retention time of the major peak for chlorpheniramine of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Chlorpheniramine Maleate*.
- **C.** The retention time of the major peak for dextromethorphan of the *Sample solution* corresponds to that of the

*Standard solution*, as obtained in the *Assay for Dextromethorphan Hydrobromide*.

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS  
USP Dextromethorphan Hydrobromide RS

▲ USP40

**Acetaminophen and Codeine Phosphate Capsules**

» Acetaminophen and Codeine Phosphate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards (11)**—

USP Acetaminophen RS  
USP Codeine Phosphate RS

**Identification**—

A: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: Transfer a portion of Capsule contents, equivalent to about 12 mg of codeine phosphate, to a separator, add 5 mL of water, 1 mL of ammonium hydroxide, and 5 mL of methylene chloride, shake for 1 minute, and allow the layers to separate. Use the clear, lower layer as the test solution. Prepare a Standard solution of USP Acetaminophen RS and USP Codeine Phosphate RS in methanol containing 12 mg of each per mL. Apply 10  $\mu$ L of each solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methanol and ammonium hydroxide (49:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wave-length UV light: the  $R_f$  values of the two principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**Dissolution, Procedure for a Pooled Sample (711)**—

Medium: 0.01 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

**Procedure**—Determine the amounts of acetaminophen ( $C_8H_9NO_2$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) dissolved by employing the procedure set forth in the *Assay*, except to use 0.01 N hydrochloric acid to prepare the *Codeine phosphate standard stock solution* and to make any other necessary volumetric adjustments.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $C_8H_9NO_2$  and  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$  is dissolved in 30 minutes.

**Uniformity of dosage units (905):** meet the requirements.

**PROCEDURE FOR CONTENT UNIFORMITY**—

*Buffer solution, Mobile phase, Codeine phosphate standard stock solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay*.

**Sample preparation**—Transfer the contents of 1 Capsule to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0-mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu$ m filter.

**Procedure**—Separately inject equal volumes (about 30  $\mu$ L) of the *Standard preparation* and the *Sample preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the Capsule taken by the formula:

$$1000C_A(r_U / r_S)$$

in which  $C_A$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Sample preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the Capsule taken by the formula:

$$(406.37/397.37)1000C_U(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C_U$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and the other terms are as defined herein.

**Assay**—

*Buffer solution, Mobile phase, Codeine phosphate standard stock solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay under Acetaminophen and Codeine Phosphate Tablets*.

**Assay preparation**—Remove as completely as possible the contents of not fewer than 20 Capsules, weigh, and mix. Transfer an accurately weighed portion of the combined contents, equivalent to about 300 mg of acetaminophen, to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0-mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu$ m filter.

**Procedure**—Separately inject equal volumes (about 30  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Capsules taken by the formula:

$$(LC_A / C_U)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of acetaminophen in each Capsule;  $C_A$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of acetaminophen in the *Assay preparation*, based upon the labeled quantity per Capsule and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Capsules taken by the formula:

$$(406.37/397.37)(LC_C / C_U)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $L$  is the labeled quantity, in mg, of codeine phosphate hemihydrate in each Capsule;  $C_C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*;  $C_U$  is the concentration, in mg

per mL, of codeine phosphate hemihydrate in the Assay preparation, based upon the labeled quantity per Capsule and the extent of dilution; and the other terms are as defined herein.

## Acetaminophen and Codeine Phosphate Oral Solution

### DEFINITION

Acetaminophen and Codeine Phosphate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

### IDENTIFICATION

- A. The retention times of the major peaks of the *Sample solutions* correspond to those of the *Standard solutions*, as obtained in the Assays for Acetaminophen and Codeine Phosphate.

- B. **THIN-LAYER CHROMATOGRAPHY**

**Standard solution:** 12 mg/mL each of USP Acetaminophen RS and USP Codeine Phosphate RS in methanol

**Sample solution:** Transfer a volume of Oral Solution, equivalent to 12 mg of codeine phosphate, to a separator. Add 1 mL of ammonium hydroxide and 5 mL of methylene chloride. Shake for 1 min, and allow the layers to separate. Use the clear lower layer.

**Developing solvent system:** Methanol and ammonium hydroxide (49:1)

**Chromatographic system**

(See Chromatography (621), Thin-Layer Chromatography.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10  $\mu$ L

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Locate the spots on the plate by examination under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  values of the two principal spots of the *Sample solution* correspond to those of the *Standard solution*.

## PROCEDURE

**Diluent:** Methanol and 0.01 N sodium hydroxide (30:70)

**Mobile phase:** Dissolve 4.9 g of monobasic potassium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 3.9, and add 216 mg of sodium 1-octanesulfonate. Add 100 mL of acetonitrile, and filter.

**Codeine phosphate standard stock solution:** 0.5 mg/mL of USP Codeine Phosphate RS in *Diluent*

**Standard stock solution:** Transfer a quantity of 5J mg of USP Acetaminophen RS (J being the ratio of the labeled amount, in mg, of acetaminophen to the labeled amount, in mg, of codeine phosphate hemihydrate) and 10.0 mL of *Codeine phosphate standard stock solution* to a 100-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume.

**System suitability stock solution:** 0.02 mg/mL of sodium benzoate and 0.03 mg/mL of methylparaben in *Diluent*

**System suitability solution:** Transfer 10.0 mL of the *System suitability stock solution* to a 50-mL volumetric flask, add 10.0 mL of *Standard stock solution*, and dilute with *Mobile phase* to volume.

**Standard solution:** 0.01 mg/mL of USP Codeine Phosphate RS and 0.01J mg/mL of USP Acetaminophen RS in *Mobile phase*. Prepare by diluting 10.0 mL of the *Standard stock solution* with *Mobile phase* to 50 mL in a volumetric flask.

**Sample stock solution:** Nominally 0.5 mg/mL of acetaminophen  $\Delta$  and 0.5 mg/mL of codeine phosphate hemihydrate  $\Delta_{USP40}$  in *Diluent* prepared as follows. Transfer a measured volume of well-mixed Oral Suspension, equivalent to 50 mg of acetaminophen, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and mix by mechanical means for 30 min. Dilute with *Diluent* to volume. Foaming may be minimized by adding a few drops of acetonitrile before diluting with *Diluent* to volume. Centrifuge a portion of this mixture.

**Sample solution:** Dilute 10.0 mL of the clear supernatant from the *Sample stock solution* with *Mobile phase* to 50 mL in a volumetric flask.

## Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L11

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu$ L

## System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for acetaminophen, benzoate, codeine, and methylparaben are about 0.25, 0.5, 1.0, and 1.3, respectively.]

## Suitability requirements

Acceptance criteria: 90.0%–110.0%

Calculate the percentage of the labeled amount of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of codeine from the *Sample solution*  
 $r_S$  = peak response of codeine from the *Standard solution*  
 $C_S$  = concentration of USP Codeine Phosphate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of codeine phosphate hemihydrate in the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of codeine phosphate hemihydrate, 406.37  
 $M_{r2}$  = molecular weight of anhydrous codeine phosphate, 397.37

Acceptance criteria: 90.0%–110.0%

#### PERFORMANCE TESTS

##### • UNIFORMITY OF DOSAGE UNITS (905)

For single-unit containers

Acceptance criteria: Meets the requirements

##### • DELIVERABLE VOLUME (698)

For multiple-unit containers

Acceptance criteria: Meets the requirements

#### IMPURITIES

Add the following:

##### ▲ 4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227): Meets the requirements▲<sup>USP40</sup>

#### SPECIFIC TESTS

##### • pH (791): 4.0–6.1

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
 USP Acetaminophen RS  
 USP Codeine Phosphate RS

### Acetaminophen and Codeine Phosphate Tablets

» Acetaminophen and Codeine Phosphate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

**Packaging and storage—**Preserve in tight, light-resistant containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Acetaminophen RS

USP Codeine Phosphate RS

#### Identification—

**A:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** A quantity of finely powdered Tablets, equivalent to about 12 mg of codeine phosphate, meets the requirements of *Identification test B* under *Acetaminophen and Codeine Phosphate Capsules*.

#### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

**Procedure—**Determine the amounts of acetaminophen ( $C_8H_9NO_2$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) dissolved by employing the procedure set forth in the *Assay*, except to use 0.01 N hydrochloric acid to prepare the *Codeine phosphate standard stock solution* and to make any other necessary volumetric adjustments.

**Tolerances—**Not less than 75% (Q) of the labeled amounts of  $C_8H_9NO_2$  and  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$  is dissolved in 30 minutes.

**Uniformity of dosage units (905):** meet the requirements.

#### PROCEDURE FOR CONTENT UNIFORMITY—

*Buffer solution, Mobile phase, Codeine phosphate standard stock solution, Standard preparation, and Chromatographic system—*Prepare as directed in the *Assay*.

**Sample preparation—**Transfer 1 Tablet to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu$ m filter.

**Procedure—**Separately inject equal volumes (about 30  $\mu$ L) of the *Standard preparation* and the *Sample preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each Tablet taken by the formula:

$$1000C_A(r_U / r_S)$$

in which  $C_A$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Sample preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in each Tablet taken by the formula:

$$(406.37/397.37)1000C_C(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C_C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and the other terms are as defined herein.

#### Assay—

**Buffer solution—**Dissolve 2.04 g of monobasic potassium phosphate in about 950 mL of water. Add 2 mL of triethylamine, adjust with phosphoric acid to a pH of 2.35, dilute with water to 1000 mL, and mix.

**Mobile phase—**Prepare a filtered and degassed mixture of *Buffer solution* and methanol (92:8). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Codeine phosphate standard stock solution—**Dissolve an accurately weighed quantity of USP Codeine Phosphate RS

in *Mobile phase* to obtain a solution having a known concentration of about 0.3 mg per mL.

**Standard preparation**—Transfer about 30 mg of USP Acetaminophen RS and 100 J mL of Codeine phosphate standard stock solution, J being the ratio of the labeled amount, in mg, of codeine phosphate hemihydrate to that of acetaminophen, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.3 mg of acetaminophen and 0.3 J mg of codeine phosphate hemihydrate per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 300 mg of acetaminophen, to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu$ m filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between acetaminophen and codeine phosphate is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0% and 3.0%, respectively.

**Procedure**—Separately inject equal volumes (about 30  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$(LC_A / C_U)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of acetaminophen in each Tablet; *C<sub>A</sub>* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; *C<sub>U</sub>* is the concentration, in mg per mL, of acetaminophen in the *Assay preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Tablets taken by the formula:

$$(406.37/397.37)(LC_C / C_U)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively; *L* is the labeled quantity, in mg, of codeine phosphate hemihydrate in each Tablet; *C<sub>C</sub>* is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; *C<sub>U</sub>* is the concentration, in mg per mL, of codeine phosphate hemihydrate in the *Assay preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and the other terms are as defined herein.

## Acetaminophen, Dextromethorphan Hydrobromide, Doxylamine Succinate, and Pseudoephedrine Hydrochloride Oral Solution

### DEFINITION

Acetaminophen, Dextromethorphan Hydrobromide, Doxylamine Succinate, and Pseudoephedrine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of

the labeled amount of acetaminophen ( $C_8H_9NO_2$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), doxylamine succinate ( $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

### IDENTIFICATION

- **A.** The retention time of the acetaminophen peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay for Acetaminophen.
- **B.** The retention time of the dextromethorphan peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay for Dextromethorphan Hydrobromide.
- **C.** The retention time of the doxylamine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay for Doxylamine Succinate.
- **D.** The retention time of the pseudoephedrine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay for Pseudoephedrine Hydrochloride.

### ASSAY

**Relative standard deviation:** NMT 2.0% determined from the acetaminophen, diphenhydramine hydrochloride, and pseudoephedrine hydrochloride responses for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of acetaminophen from the *Sample solution*

$r_S$  = peak response of acetaminophen from the *Standard solution*

$C_S$  = concentration of USP Acetaminophen RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of acetaminophen in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ )

**Change to read:****• DIPHENHYDRAMINE HYDROCHLORIDE**

**Solution A, Diluent, Mobile phase, Standard solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay for Acetaminophen*.

**Sample stock solution:** Nominally 0.125 mg/mL of diphenhydramine hydrochloride in *Diluent* prepared as follows. Transfer an amount nominally equivalent to 12.5 mg of diphenhydramine hydrochloride from a portion of finely powdered Tablets (NLT 20) to a 100-mL volumetric flask, add 75 mL of *Diluent*, and sonicate for 15 min. Dilute with *Diluent* to volume.

**Sample solution:** Nominally 12.5 µg/mL of diphenhydramine hydrochloride  $\Delta_{\text{USP40}}$  from the *Sample stock solution* in *Diluent*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of diphenhydramine hydrochloride ( $\text{C}_{17}\text{H}_{21}\text{NO} \cdot \text{HCl}$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of diphenhydramine from the *Sample solution*

$r_S$  = peak response of diphenhydramine from the *Standard solution*

$C_S$  = concentration of USP Diphenhydramine Hydrochloride RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of diphenhydramine hydrochloride in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of diphenhydramine hydrochloride ( $\text{C}_{17}\text{H}_{21}\text{NO} \cdot \text{HCl}$ )

#### • PSEUDOEPHEDRINE HYDROCHLORIDE

**Solution A, Diluent, Mobile phase, Standard solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay for Acetaminophen*.

**Sample stock solution:** Nominally 0.3 mg/mL of pseudoephedrine hydrochloride in *Diluent* prepared as follows. Transfer an amount nominally equivalent to 30 mg of pseudoephedrine hydrochloride from a portion of finely powdered Tablets (NLT 20) to a 100-mL volumetric flask, add 75 mL of *Diluent*, and sonicate for 15 min. Dilute with *Diluent* to volume.

**Sample solution:** Nominally 30 µg/mL of pseudoephedrine hydrochloride from the *Sample stock solution* in *Diluent*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of pseudoephedrine from the *Sample solution*

$r_S$  = peak response of pseudoephedrine from the *Standard solution*

$C_S$  = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ )

#### PERFORMANCE TESTS

- **DISSOLUTION** (711), *Procedure*, *Apparatus 1* and *Apparatus 2*, *Immediate-Release Dosage Forms*, *Procedure for a pooled sample for immediate-release dosage forms*

**Medium:** pH 5.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Solution A, Diluent, Mobile phase, Standard solution, and Chromatographic system:** Proceed as directed in the *Assay for Acetaminophen*.

**Sample solution A:** Combine equal volumes of the filtered solutions, and use the pooled sample.

**Sample solution B:** Transfer 5.0 mL of *Sample solution A* to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

**Analysis:** Using *Sample solution A* and the *Standard solution*, and making any necessary volumetric adjustments, proceed as directed in the *Assay for Diphenhydramine Hydrochloride* and the *Assay for Pseudoephedrine Hydrochloride*, and determine the percentage of the labeled amount of diphenhydramine hydrochloride ( $\text{C}_{17}\text{H}_{21}\text{NO} \cdot \text{HCl}$ ) and pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ) dissolved. Using *Sample solution B* and the *Standard solution*, and making any necessary volumetric adjustments, proceed as directed in the *Assay for Acetaminophen*, and determine the percentage of the labeled amount of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) dissolved.

**Tolerances:** NLT 75% (Q) of the labeled amount of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ), diphenhydramine hydrochloride ( $\text{C}_{17}\text{H}_{21}\text{NO} \cdot \text{HCl}$ ), and pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ) is dissolved.

#### For Tablets labeled as chewable

**Medium:** pH 5.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

**Apparatus 2:** 75 rpm

**Time:** 45 min

**Tolerances:** NLT 75% (Q) of the labeled amount of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ), diphenhydramine hydrochloride ( $\text{C}_{17}\text{H}_{21}\text{NO} \cdot \text{HCl}$ ), and pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### IMPURITIES

##### Add the following:

- **4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS** (227): Meet the requirements  $\Delta_{\text{USP40}}$

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Acetaminophen RS  
USP Diphenhydramine Hydrochloride RS  
USP Pseudoephedrine Hydrochloride RS

## Acetaminophen and Pseudoephedrine Hydrochloride Tablets

#### DEFINITION

Acetaminophen and Pseudoephedrine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) and pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ).

#### IDENTIFICATION

- **A.** The retention times of the acetaminophen and pseudoephedrine peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### Change to read:

#### • PROCEDURE

**Diluent:** Acetonitrile and water (10:90)

**Solution A:** 0.005 M ethanesulfonic acid and 0.05 M monobasic potassium phosphate

**Mobile phase:** Acetonitrile and *Solution A* (100:900). Adjust with 5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.6.

**Pseudoephedrine hydrochloride standard stock solution:** 0.6 mg/mL of USP Pseudoephedrine Hydrochloride RS in *Diluent*

**Standard solution:** Transfer 6J mg of USP Acetaminophen RS to a 100-mL volumetric flask, J being the ratio of the labeled quantity (mg) of acetaminophen to the labeled quantity (mg) of pseudoephedrine hydrochloride in each Tablet. Add 2.0 mL of 1 N hydrochloric acid and 20 mL of *Diluent*, and mix to dissolve. Add 10.0 mL of *Pseudoephedrine hydrochloride standard solution* and dilute with *Diluent* to volume. This solution contains 0.06J mg/mL of USP Acetaminophen RS and 0.06 mg/mL of USP Pseudoephedrine Hydrochloride RS.

**Sample solution:** Nominally 0.06 mg/mL of pseudoephedrine hydrochloride prepared as follows. Transfer a portion of finely powdered Tablets (NLT 20), equivalent to 30 mg of pseudoephedrine hydrochloride, to a 500-mL volumetric flask, add 10.0 mL of 1 N hydrochloric acid and 100 mL of *Diluent*, and sonicate for 30 min, with occasional shaking. Allow to cool, and dilute with *Diluent* to volume. Pass a portion of this solution through a glass fiber filter, and use the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 4.6-mm × 25-cm; base-deactivated or end-capped packing L1

**Flow rate:** 3 mL/min

**Injection volume:** 10 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen and pseudoephedrine are about 0.55 and 1.0, respectively. ▲<sub>USP40</sub>]

#### Suitability requirements

**Resolution:** NLT 3.5 between acetaminophen and pseudoephedrine

**Tailing factor:** NMT 2 for the pseudoephedrine peak

**Relative standard deviation:** NMT 2.0% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the corresponding analyte from the *Sample solution*

$r_S$  = peak response of the corresponding analyte from the *Standard solution*

$C_S$  = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the appropriate analyte in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ )

#### PERFORMANCE TESTS

- **DISSOLUTION (711), Procedure, Apparatus 1 and Apparatus 2, Immediate-Release Dosage Forms, Procedure for a pooled sample for immediate-release dosage forms**

**Medium:** pH 5.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

Determine the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) dissolved by using the following method.

**Mobile phase:** Proceed as directed in the Assay.

**Standard solution:** (L/900) mg/mL of USP Pseudoephedrine Hydrochloride RS and (L/900) mg/mL of USP

Acetaminophen RS in *Medium*. [NOTE—L is the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Tablet; and J is the ratio of the labeled quantity, in mg, of acetaminophen to the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Tablet.]

**Sample solution:** Filtered portion of the solution under test, suitably diluted with *Medium*, if necessary

**Chromatographic system and System suitability:** Proceed as directed in the Assay, except to inject the *Standard solution*.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Inject 20 µL of the *Samples*, and measure the responses for the acetaminophen and pseudoephedrine peaks.]

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times V \times (C_S/L) \times 100$$

$r_U$  = peak response of the corresponding analyte from the *Sample solution*

$r_S$  = peak response of the corresponding analyte from the *Standard solution*

V = volume of *Medium*, 900 mL

$C_S$  = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)

L = label amount of the corresponding analyte in a Tablet (mg)

**Tolerances:** NLT 75% (Q) of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) is dissolved.

#### For Tablets labeled as chewable

## Acetaminophen and Tramadol Hydrochloride Tablets

**New title:** *Tramadol Hydrochloride and Acetaminophen Tablets*

(Title for this monograph—not to change until February 1, 2017)

(Prior to February 1, 2017, the current practice of labeling the article of commerce with the name Acetaminophen

and Tramadol Hydrochloride Tablets may be continued. Use of the name Tramadol Hydrochloride and Acetaminophen Tablets will be permitted as of August 1, 2014, but the use of this name will not be mandatory until February 1, 2017. The 30-month extension will provide the time needed by manufacturers and users to make necessary changes.)

#### DEFINITION

Acetaminophen and Tramadol Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) and acetaminophen ( $C_8H_9NO_2$ ).

#### IDENTIFICATION

- A. The retention times of Tramadol sample solution and the Acetaminophen sample solution correspond to those of the Standard solution, as obtained in the Assay.

#### ASSAY

##### Change to read:

#### PROCEDURE

**Mobile phase:** Tetrahydrofuran, triethylamine, water, and trifluoroacetic acid (8: 0.1: 92: 0.1). The apparent pH of the final solvent mixture should be between 2.2 and 2.4.

**Diluent:** Methanol and water (1:9)

**Standard solution:** 0.065 mg/mL of USP Acetaminophen RS and 0.075 mg/mL of USP Tramadol Hydrochloride RS in Diluent. Sonication may be used to aid dissolution.

**Sample stock solution:** Weigh NLT 20 Tablets, and determine the average Tablet weight. Grind the Tablets into a fine powder, and transfer an amount equivalent to one Tablet to a 50-mL volumetric flask. Add 30 mL of Diluent with continuous shaking to disperse the powder. Sonicate for 15 min with intermittent shaking, and shake the flask on a mechanical shaker for 30 min. Dilute with Diluent to volume, and mix well. Centrifuge the suspension, and use the supernatant for subsequent dilutions.

**Tramadol sample solution:** Nominally 75 µg/mL of tramadol hydrochloride in Diluent from the Sample stock solution

**Acetaminophen sample solution:** Nominally 65 µg/mL of acetaminophen in Diluent from the Sample stock solution

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 216 nm for tramadol hydrochloride and UV 249 nm for acetaminophen

**Column:** 4.6-mm × 15-cm; 5-µm packing L11

**Column temperature:** 50°

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**Run time:** 4 times the retention time of acetaminophen

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Resolution:** NLT 10.0 between acetaminophen and tramadol

▲ USP40

**Tailing factor:** NMT 2.0 for each analyte

**Relative standard deviation:** NMT 2.0% for each analyte

#### Analysis

**Samples:** Standard solution, Tramadol sample solution, and Acetaminophen sample solution

Calculate the percentage of the labeled amount of tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of tramadol from the Tramadol sample solution

$r_S$  = peak response of tramadol from the Standard solution

$C_S$  = concentration of USP Tramadol Hydrochloride RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of tramadol hydrochloride in the Tramadol sample solution (mg/mL)

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of acetaminophen from the Acetaminophen sample solution

$r_S$  = peak response of acetaminophen from the Standard solution

$C_S$  = concentration of USP Acetaminophen RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acetaminophen in the Acetaminophen sample solution (mg/mL)

#### Acceptance criteria

**Tramadol hydrochloride:** 90.0%–110.0% of the labeled amount of tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ )

**Acetaminophen:** 90.0%–110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ )

#### PERFORMANCE TESTS

##### DISSOLUTION (711)

###### Test 1

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Buffer solution:** 6.8 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.50.

**Mobile phase:** Acetonitrile and Buffer solution (1:4)

**Standard solution:** 0.36 mg/mL of USP Acetaminophen RS and 0.04 mg/mL of USP Tramadol Hydrochloride RS in Medium

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 272 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L7

**Column temperature:** 25°

**Flow rate:** 1 mL/min

**Injection volume:** 25 µL

**Run time:** 2 times the retention time of tramadol

#### System suitability

**Sample:** Standard solution

[NOTE—The relative retention times for acetaminophen and tramadol are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 5.0 between the acetaminophen and tramadol peaks

**Relative standard deviation:** NMT 2.0% for both the acetaminophen and tramadol peaks

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) dissolved:

$$\text{Result} = (r_u/r_s) \times C_s \times V \times (1/L) \times 100$$

$r_u$  = peak response of acetaminophen or tramadol from the *Sample solution*

$r_s$  = peak response of acetaminophen or tramadol from the *Standard solution*

$C_s$  = concentration of USP Acetaminophen RS or USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim for acetaminophen or tramadol hydrochloride (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 20 min

**Buffer solution, Mobile phase, Standard solution, Sample solution, Chromatographic system, and Analysis:** Proceed as directed in *Dissolution Test 1*.

**Tolerances:** NLT 80% (Q) of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**OTHER COMPONENTS****Delete the following:**▲ **LIMIT OF p-AMINOPHENOL**

All Standards, the *Sample solution*, and the *Blank solution* must be mixed with the *Basic ferricyanide solution* and analyzed as soon as possible after a 30-min waiting period.

**Diluent:** Methanol and water (1:1)

**Basic ferricyanide solution:** Dissolve 1 g of sodium nitroferricyanide and 1 g of anhydrous sodium carbonate in 100 mL of water.

**Standard solution:** Dissolve USP *p*-Aminophenol RS in *Diluent* to obtain a solution having a known concentration of 0.05 mg/mL. Sonicate if necessary to dissolve. Transfer 5 mL of the resulting solution to a 100-mL volumetric flask, and add 50 mL of *Diluent* and 5 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, and mix. Let stand for 30 min. Pass the solution through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate.

**Sample solution:** Weigh NLT 20 Tablets. Grind the Tablets into a fine powder. Accurately transfer an amount of powder, equivalent to about 5 g of acetaminophen based on the label claim, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and sonicate for 15 min with intermittent shaking, followed by mechanical shaking for 30 min. Add 6 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, mix, and let stand for 30 min. Centrifuge a portion of the solution, pass the clear supernatant through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate for analysis.

**Blank solution:** Add 50 mL of *Diluent* to a 100-mL volumetric flask. Add 5 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, and let stand for 30 min. Pass a portion of the solution through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate for analysis.

**Instrumental conditions**

(See *Ultraviolet-Visible Spectroscopy* (857).)

**Mode:** UV-Vis

**Analytical wavelength:** 710 nm

**Cell:** 1 cm

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 6.0%. The percent difference between the initial and final absorbance readings of the *Standard solution* differs by NMT 10%.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of *p*-aminophenol ( $C_6H_7NO$ ) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP *p*-Aminophenol RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.01%▲USP40

**IMPURITIES****Add the following:**

- ▲ **4-AMINOPHENOL IN ACETAMINOPHEN-CONTAINING DRUG PRODUCTS (227):** Meet the requirements▲USP40

**Sample stock solution:** Weigh NLT 20 Tablets, and determine the average Tablet weight. Grind the Tablets into a fine powder, and transfer an amount equivalent to one Tablet to a 50-mL volumetric flask. Add 30 mL of *Diluent* with continuous shaking to disperse the powder. Sonicate for 15 min with intermittent shaking, and shake the flask on a mechanical shaker for 30 min. Dilute with *Diluent* to volume, and mix well. Centrifuge the suspension, and use the supernatant for subsequent dilutions.

**Tramadol sample solution:** Nominally 75  $\mu\text{g/mL}$  of tramadol hydrochloride in *Diluent* from the *Sample stock solution*

**Acetaminophen sample solution:** Nominally 65  $\mu\text{g/mL}$  of acetaminophen in *Diluent* from the *Sample stock solution*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 216 nm for tramadol hydrochloride and UV 249 nm for acetaminophen

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu\text{m}$  packing L11

**Column temperature:** 50°

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu\text{L}$

**Run time:** 4 times the retention time of acetaminophen

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 10.0 between acetaminophen and tramadol

▲▲USP40

**Tailing factor:** NMT 2.0 for each analyte

**Relative standard deviation:** NMT 2.0% for each analyte

#### Analysis

**Samples:** *Standard solution*, *Tramadol sample solution*, and *Acetaminophen sample solution*

Calculate the percentage of the labeled amount of tramadol hydrochloride ( $\text{C}_{16}\text{H}_{25}\text{NO}_2 \cdot \text{HCl}$ ) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response of tramadol from the *Tramadol sample solution*

$r_s$  = peak response of tramadol from the *Standard solution*

$C_s$  = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of tramadol hydrochloride in the *Tramadol sample solution* (mg/mL)

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of acetaminophen from the *Acetaminophen sample solution*  
 $r_S$  = peak response of acetaminophen from the *Standard solution*  
 $C_S$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of acetaminophen in the *Acetaminophen sample solution* (mg/mL)

#### Acceptance criteria

**Tramadol hydrochloride:** 90.0%–110.0% of the labeled amount of tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ )

**Acetaminophen:** 90.0%–110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ )

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

###### Test 1

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Buffer solution:** 6.8 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.50.

**Mobile phase:** Acetonitrile and *Buffer solution* (1:4)

**Standard solution:** 0.36 mg/mL of USP Acetaminophen RS and 0.04 mg/mL of USP Tramadol Hydrochloride RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 272 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 25°

**Flow rate:** 1 mL/min

**Injection volume:** 25  $\mu$ L

**Run time:** 2 times the retention time of tramadol

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen and tramadol are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 5.0 between the acetaminophen and tramadol peaks

**Relative standard deviation:** NMT 2.0% for both the acetaminophen and tramadol peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

- $r_U$  = peak response of acetaminophen or tramadol from the *Sample solution*  
 $r_S$  = peak response of acetaminophen or tramadol from the *Standard solution*  
 $C_S$  = concentration of USP Acetaminophen RS or USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label claim for acetaminophen or tramadol hydrochloride (mg/Tablet)  
**Tolerances:** NLT 80% (Q) of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 20 min

**Buffer solution, Mobile phase, Standard solution, Sample solution, Chromatographic system, System suitability, and Analysis:** Proceed as directed in *Dissolution Test 1*.

**Tolerances:** NLT 80% (Q) of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### OTHER COMPONENTS

##### Delete the following:

##### • LIMIT OF *p*-AMINOPHENOL

All Standards, the *Sample solution*, and the *Blank solution* must be mixed with the *Basic ferricyanide solution* and analyzed as soon as possible after a 30-min waiting period.

**Diluent:** Methanol and water (1:1)

**Basic ferricyanide solution:** Dissolve 1 g of sodium nitroferricyanide and 1 g of anhydrous sodium carbonate in 100 mL of water.

**Standard solution:** Dissolve USP *p*-Aminophenol RS in *Diluent* to obtain a solution having a known concentration of 0.05 mg/mL. Sonicate if necessary to dissolve. Transfer 5 mL of the resulting solution to a 100-mL volumetric flask, and add 50 mL of *Diluent* and 5 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, and mix. Let stand for 30 min. Pass the solution through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate.

**Sample solution:** Weigh NLT 20 Tablets. Grind the Tablets into a fine powder. Accurately transfer an amount of powder, equivalent to about 5 g of acetaminophen based on the label claim, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and sonicate for 15 min with intermittent shaking, followed by mechanical shaking for 30 min. Add 6 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, mix, and let stand for 30 min. Centrifuge a portion of the solution, pass the clear supernatant through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate for analysis.

**Blank solution:** Add 50 mL of *Diluent* to a 100-mL volumetric flask. Add 5 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, and let stand for 30 min. Pass a portion of the solution through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate for analysis.

#### Instrumental conditions

## Acetazolamide Compounded Oral Suspension

#### DEFINITION

Acetazolamide Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of acetazolamide ( $C_4H_6N_4O_3S_2$ ).

Prepare Acetazolamide Compounded Oral Suspension, 25 mg/mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Acetazolamide	2.5 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution, NF (regular or sugar-free), and Vehicle for Oral Suspension, NF, or Cherry Syrup, NF, a sufficient quantity to make	100 mL

If using tablets, place in a mortar and comminute to a fine powder, or add *Acetazolamide* powder. Add about 20 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough liquid *Vehicle* to bring to final volume, and mix well.

#### ASSAY

##### PROCEDURE

**Mobile phase:** Dissolve 4.1 g of anhydrous sodium acetate in 950 mL of water, and add 20 mL of methanol and 30 mL of acetonitrile. Adjust with glacial acetic acid to a pH of 4.0.

**Standard stock solution:** Transfer about 25 mg of USP Acetazolamide RS, accurately weighed, to a 50-mL volumetric flask, add 5.0 mL of 0.5 N sodium hydroxide, and mix to dissolve. Dilute with water to volume, and mix.

**Standard solution:** 250 µg/mL of USP Acetazolamide RS from the *Standard stock solution* in water

**Sample solution:** 250 µg/mL of acetazolamide from Oral Suspension in *Mobile phase*. Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at  $-70^\circ$  until analyzed. At the time of analysis, remove the sample from the freezer, allow to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; 5-µm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for the acetazolamide peak is about 3 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 1.1% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetazolamide ( $C_4H_6N_4O_3S_2$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acetazolamide RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of acetazolamide in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

#### SPECIFIC TESTS

- **PH** (791): 4.0–5.0 (Vehicle for Oral Solution and Vehicle for Oral Suspension), 3.1–3.9 (Cherry Syrup)

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a refrigerator.
- **BEYOND-USE DATE:** NMT 60 days after the day on which it was compounded when stored at controlled room temperature, or in a refrigerator
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS** (11)  
USP Acetazolamide RS

## Acetazolamide Tablets

#### DEFINITION

Acetazolamide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of acetazolamide ( $C_4H_6N_4O_3S_2$ ).

**IDENTIFICATION**• **A. INFRARED ABSORPTION (197K)**

**Sample:** Extract a quantity of finely powdered Tablets, equivalent to about 500 mg of acetazolamide, with 50 mL of acetone. Filter, and add sufficient solvent hexane to the filtrate to cause formation of a heavy, white precipitate. Collect the precipitate on a medium-porosity, sintered-glass funnel, and dry with suction.

**Acceptance criteria:** Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Dissolve 4.1 g of anhydrous sodium acetate in 950 mL of water, add 20 mL of methanol and 30 mL of acetonitrile, and mix. Adjust with glacial acetic acid to a pH of 4.0.

**Standard solution:** 0.1 mg/mL of USP Acetazolamide RS prepared as follows. Transfer USP Acetazolamide RS into a suitable volumetric flask, add 0.5 N sodium hydroxide equivalent to 10% of the final volume, and dilute with water to volume.

**Sample stock solution:** Nominally equivalent to 1.0 mg/mL of acetazolamide prepared as follows. Transfer a portion of the powder, from NLT 20 Tablets, equivalent to 100 mg acetazolamide into a 100-mL volumetric flask. Add 10 mL of 0.5 N sodium hydroxide, sonicate for 5 min, cool to room temperature, and dilute with water to volume. Filter a portion of this solution, discarding the first 20 mL of the filtrate.

**Sample solution:** Nominally equivalent to 0.1 mg/mL of acetazolamide prepared as follows. Transfer 10.0 mL of *Sample stock solution* and 10 mL of 0.5 N sodium hydroxide to a 100-mL volumetric flask, and dilute with water to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20 µL

**System suitability**

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of acetazolamide ( $C_4H_6N_4O_3S_2$ ) dissolved:

$$(A_U/A_S) \times C_S \times D \times (V/L) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$D$  = dilution factor of the *Sample solution*, if needed

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of acetazolamide ( $C_4H_6N_4O_3S_2$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS (11)**

USP Acetazolamide RS

**Glacial Acetic Acid**

$C_2H_4O_2$

60.05

Acetic acid [64-19-7].

**DEFINITION**

Glacial Acetic Acid contains NLT 99.5% and NMT 100.5%, by weight, of  $C_2H_4O_2$ .

**IDENTIFICATION**

- **IDENTIFICATION TESTS—GENERAL, Acetate (191):** Meets the requirements

**Sample solution** (for lanthanum nitrate test): Glacial Acetic Acid and water (1:100)

**ASSAY**• **PROCEDURE**

**Sample solution:** Measure 2 mL of Glacial Acetic Acid into a glass-stoppered flask, previously tared while containing about 20 mL of water, and weigh again to obtain the weight of the substance under assay.

**Analysis:** Add 20 mL of water, then add phenolphthalein TS. Titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 60.05 mg of  $C_2H_4O_2$ .

**Acceptance criteria:** 99.5%–100.5%

**IMPURITIES****Inorganic Impurities**

- **LIMIT OF NONVOLATILE RESIDUE:** Evaporate 20 mL in a tared dish, and dry at 105° for 1 h: the weight of the residue does not exceed 1.0 mg.

**Delete the following:**

- **HEAVY METALS** (231): NMT 5 ppm  
*Sample solution:* To the residue obtained in the test for *Limit of Nonvolatile Residue* add 8 mL of 0.1 N hydrochloric acid, warm gently until solution is complete, dilute with water to 100 mL, and use 20 mL. (Official 1-Jan-2018)
  - **CHLORIDE AND SULFATE, Chloride** (221)  
*Sample solution:* Dilute 1.0 mL with 20 mL of water.  
*Analysis:* Add 5 drops of silver nitrate TS.  
*Acceptance criteria:* No opalescence is produced.
  - **CHLORIDE AND SULFATE, Sulfate** (221)  
*Sample solution:* Dilute 1.0 mL with 10 mL of water.  
*Analysis:* Add 1 mL of barium chloride TS.  
*Acceptance criteria:* No turbidity is produced.
- Organic Impurities**
- **PROCEDURE: READILY OXIDIZABLE SUBSTANCES**  
*Sample solution:* Dilute 2.0 mL in a glass-stoppered vessel with 10 mL of water.  
*Analysis:* Add 0.10 mL of 0.10 N potassium permanganate.  
*Acceptance criteria:* The pink color is not changed to brown within 2 h.

**SPECIFIC TESTS**

- **CONGEALING TEMPERATURE** (651): NLT 15.6°

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at room temperature.

**Acetic Acid Irrigation****DEFINITION**

Acetic Acid Irrigation is a sterile solution of Glacial Acetic Acid in Water for Injection. It contains, in each 100 mL, NLT 237.5 mg and NMT 262.5 mg of  $C_2H_4O_2$ .

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL, Acetate** (191)  
*Sample:* 100 mL of Acetic Acid Irrigation  
*Analysis:* Evaporate the *Sample* to about 10 mL.  
*Acceptance criteria:* The resulting solution meets the requirements.

**ASSAY**• **PROCEDURE**

*Sample:* 50 mL of Acetic Acid Irrigation  
*Analysis:* Pipet the *Sample* into a 150-mL conical flask, add 2 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 6.005 mg of acetic acid ( $C_2H_4O_2$ ).  
*Acceptance criteria:* 237.5–262.5 mg of  $C_2H_4O_2$  in each 100 mL of Acetic Acid Irrigation

**SPECIFIC TESTS**

- **PH** (791): 2.8–3.4
- **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 0.5 USP Endotoxin Unit/mL.
- **OTHER REQUIREMENTS:** It meets the requirements under *Injections* and *Implanted Drug Products* (1), except that the container in which it is packaged may be designed to empty rapidly and may exceed 1000 mL in capacity.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I or Type II glass, and store at controlled room temperature. It may be packaged in suitable plastic containers.

- **USP REFERENCE STANDARDS** (11)  
 USP Endotoxin RS

**Acetic Acid Otic Solution****DEFINITION**

Acetic Acid Otic Solution is a solution of Glacial Acetic Acid in a suitable nonaqueous solvent. It contains NLT 85.0% and NMT 130.0% of the labeled amount of  $C_2H_4O_2$ .

**IDENTIFICATION**

- **A.**  
*Sample solution:* Dilute 5 mL of Acetic Acid Otic Solution with 10 mL of water.  
*Analysis:* Adjust the *Sample solution* with 1 N sodium hydroxide to a pH of 7. Add ferric chloride TS.  
*Acceptance criteria:* A deep red color is produced, and it is destroyed by the addition of hydrochloric acid.
- **B.**  
*Analysis:* Warm it with sulfuric acid and alcohol.  
*Acceptance criteria:* Ethyl acetate, recognizable by its characteristic odor, is evolved.

**ASSAY**• **PROCEDURE**

*Sample:* A quantity of Acetic Acid Otic Solution containing 100 mg of glacial acetic acid  
*Analysis:* Transfer the *Sample* to a 250-mL conical flask, and add 5 mL of saturated sodium chloride solution, 40 mL of water, and 3 drops of phenolphthalein TS. Titrate with 0.1 N sodium hydroxide VS to a faint pink endpoint. Each mL of 0.1 N sodium hydroxide is equivalent to 6.005 mg of acetic acid ( $C_2H_4O_2$ ).  
*Acceptance criteria:* 85.0%–130.0%

**SPECIFIC TESTS**

- **PH** (791)  
*Sample solution:* Acetic Acid Otic Solution and water (1:1)  
*Acceptance criteria:* 2.0–4.0

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

**Acetohexamide**

$C_{15}H_{20}N_2O_4S$  324.40  
 Benzenesulfonamide, 4-acetyl-N-[[cyclohexylamino]carbonyl]-  
 1-[(p-Acetylphenyl)sulfonyl]-3-cyclohexylurea [968-81-0].

» Acetohexamide contains not less than 97.0 percent and not more than 101.0 percent of  $C_{15}H_{20}N_2O_4S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
 USP Acetohexamide RS

**Identification—****A:** Infrared Absorption (197K).**B:** Ultraviolet Absorption (197U)—*Solution:* 10 µg per mL.*Medium:* 0.01 N sodium hydroxide.

Absorptivities at 247 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 182.5° and 187°.**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.**Residue on ignition** (281): not more than 0.1%.**Selenium** (291): 0.003%, a 200-mg specimen mixed with 200 mg of magnesium oxide being used.**Delete the following:****• Heavy metals, Method II** (231): 0.002%. (Official 1-Jan-2018)**Assay**—Dissolve about 300 mg of Acetohexamide, accurately weighed, in 40 mL of dimethylformamide, add 5 drops of thymol blue TS, and titrate, using a magnetic stirrer, with 0.1 N sodium methoxide VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium methoxide is equivalent to 32.44 mg of C<sub>15</sub>H<sub>20</sub>N<sub>2</sub>O<sub>4</sub>S.**Acetohexamide Tablets**» Acetohexamide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of C<sub>15</sub>H<sub>20</sub>N<sub>2</sub>O<sub>4</sub>S.**Packaging and storage**—Preserve in well-closed containers.**USP Reference standards** (11)—

USP Acetohexamide RS

**Identification**—Evaporate on a steam bath to dryness a 20-mL portion of the diluted chloroform solution prepared as directed in the Assay: the residue meets the requirements of Identification test A under Acetohexamide.**Dissolution** (711)—*Medium:* pH 7.6 phosphate buffer (see pH (791)); 900 mL.*Apparatus 1:* 100 rpm.*Time:* 60 minutes.*Procedure*—Determine the amount of C<sub>15</sub>H<sub>20</sub>N<sub>2</sub>O<sub>4</sub>S dissolved from UV absorbances at the wavelength of maximum absorbance at about 245 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, using *Medium* as the blank, in comparison with a Standard solution having a known concentration of USP Acetohexamide RS in the same *Medium*.*Tolerances*—Not less than 75% (Q) of the labeled amount of C<sub>15</sub>H<sub>20</sub>N<sub>2</sub>O<sub>4</sub>S is dissolved in 60 minutes.**Uniformity of dosage units** (905): meet the requirements.**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of acetohexamide, to a 100-mL volumetric flask, add 60 mL of 0.1 N sodium hydroxide, and shake for 30 minutes. Dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate. Transfer 20.0 mL of the subsequent filtrate to a 125-mL separator, add 2 mL of 3 N hydrochloric acid, and extract with four 40-mL portions of chloroform, filtering each portion through chloroform-washed paper into a 200-mL volumetric flask. Dilute with chloroform to volume, and mix. Transfer20.0 mL of this solution to a suitable beaker, and evaporate on a steam bath to dryness. Transfer the residue, with the aid of 0.1 N sodium hydroxide, to a 100-mL volumetric flask, add 0.1 N sodium hydroxide to volume, and mix. Transfer 10.0 mL of this solution to a third 100-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of the solution from the Tablets and a Standard solution prepared from USP Acetohexamide RS, in the same medium, at a concentration of about 10 µg per mL, in 1-cm cells, at the wavelength of maximum absorbance at about 247 nm, with a suitable spectrophotometer, using 0.01 N sodium hydroxide as the blank. Calculate the quantity, in mg, of C<sub>15</sub>H<sub>20</sub>N<sub>2</sub>O<sub>4</sub>S in the portion of Tablets taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Acetohexamide RS in the Standard solution; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the solution from the Tablets and the Standard solution, respectively.**Acetohydroxamic Acid**C<sub>2</sub>H<sub>5</sub>NO<sub>2</sub>

75.07

N-Acetyl hydroxyacetamide;

Acetohydroxamic acid [546-88-3].

**DEFINITION**Acetohydroxamic Acid, dried over phosphorus pentoxide for 16 h, contains NLT 98.0% and NMT 101.0% of acetohydroxamic acid (C<sub>2</sub>H<sub>5</sub>NO<sub>2</sub>).**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197K)• **B.***Sample solution:* 20 mg/mL in water*Analysis:* To 10 mL of the *Sample solution* add 2 drops of potassium permanganate TS.*Acceptance criteria:* The pink color of the permanganate disappears.**ASSAY**• **PROCEDURE***Ferric chloride solution:* 20 mg/mL of ferric chloride in 0.1 N hydrochloric acid*Standard solution:* 500 µg/mL of USP Acetohydroxamic Acid RS in 0.1 N hydrochloric acid*Sample solution:* 500 µg/mL of Acetohydroxamic Acid, previously dried, in 0.1 N hydrochloric acid*Blank:* 0.1 N hydrochloric acid**Analysis***Samples:* *Standard solutions*, *Sample solution*, and *Blank*Transfer 10.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* to separate 100-mL volumetric flasks. To each flask add 50 mL of 0.1 N hydrochloric acid and 10.0 mL of *Ferric chloride solution*, and dilute with 0.1 N hydrochloric acid to volume. Without delay, concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 502 nm using the *Blank* to set the instrument.Calculate the percentage of acetohydroxamic acid (C<sub>2</sub>H<sub>5</sub>NO<sub>2</sub>) in the portion of Acetohydroxamic Acid taken:

$$\text{Result} = (A_U / A_S) \times (C_S / C_U) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of USP Acetohydroxamic Acid RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Acetohydroxamic Acid in the *Sample solution* ( $\mu\text{g/mL}$ )

Acceptance criteria: 98.0%–101.0% on the previously dried basis

## IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

## Delete the following:

- **HEAVY METALS, Method I** (231)  
*Sample solution:* Dissolve 1 g in 23 mL of water, and add 2 mL of 1 N acetic acid.  
*Acceptance criteria:* NMT 20 ppm (Official, 1-Jan-2018)
- **LIMIT OF HYDROXYLAMINE**  
*Buffer:* 1.36 g/L of monobasic potassium phosphate in water, adjusted with 1 M potassium hydroxide to a pH of 7.4  
*Solution A:* 1 mg/mL of pyridoxal 5-phosphate monohydrate in *Buffer*, prepared in a low-actinic flask fresh before use  
*Standard stock solution:* 2.0 mg/mL of hydroxylamine hydrochloride in water  
*Standard solutions:* Transfer 5.0, 10.0, and 15.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and dilute with water to volume.  
*Sample solution:* Transfer 1500 mg of Acetohydroxamic Acid, previously dried, to a 100-mL beaker, and dissolve in a sufficient amount of water to cover the electrode of a calibrated pH meter (about 60 mL). While stirring, adjust with 0.05 M potassium hydroxide to a pH of 7.4. Transfer the contents of the beaker, with the aid of small portions of water, to a 100-mL volumetric flask, and dilute with water to volume.  
*Blank:* Water  
*Analysis*  
*Samples:* *Standard solutions*, *Sample solution*, and *Blank*  
 Transfer 2.0 mL of each *Standard solution*, the *Sample solution*, and *Blank* into separate 100-mL volumetric flasks. To each flask add 4.0 mL of *Solution A*. After 8 min, accurately timed, dilute the contents of each flask with *Buffer* to volume.  
 Immediately determine the fluorescence intensities of the solutions from the *Standard solutions* and the *Sample solution* in a fluorometer at an excitation wavelength of 350 nm and an emission wavelength of 450 nm, setting the instrument to zero with the *Blank*. Determine the best-fit straight line from the fluorescence intensities of the three *Standard solutions* versus the hydroxylamine hydrochloride concentrations, in  $\mu\text{g/mL}$ . From the best-fit straight line, determine the concentration, in  $\mu\text{g/mL}$ , of hydroxylamine hydrochloride in the *Sample solution*.  
 Calculate the percentage of hydroxylamine in the portion of Acetohydroxamic Acid taken:

$$\text{Result} = (C_U/C) \times (M_{r1}/M_{r2}) \times 100$$

- $C_U$  = concentration of hydroxylamine hydrochloride in the *Sample solution* (mg/mL)  
 $C$  = concentration of Acetohydroxamic Acid in the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of hydroxylamine, 33.03  
 $M_{r2}$  = molecular weight of hydroxylamine hydrochloride, 69.50  
 Acceptance criteria: NMT 0.5%

## SPECIFIC TESTS

- **LOSS ON DRYING** (731)  
*Analysis:* Dry a sample over phosphorus pentoxide for 16 h.

Acceptance criteria: NMT 1.0%

- **COMPLETENESS OF SOLUTION** (641): A 1.0-g portion dissolves in 10 mL of water to yield a clear solution.
- **COLOR OF SOLUTION**  
*Sample solution:* 200 mg/mL in water  
*Blank:* Water  
*Instrumental conditions*  
 (See *Ultraviolet-Visible Spectroscopy* (857).)  
*Mode:* UV-Vis  
*Analytical wavelength:* Between 400 and 750 nm  
*Cell:* 1 cm  
 Acceptance criteria: The absorbance is NMT 0.050.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a cool, dry place.
- **USP REFERENCE STANDARDS** (11)  
 USP Acetohydroxamic Acid RS

## Acetohydroxamic Acid Tablets

### DEFINITION

Acetohydroxamic Acid Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetohydroxamic acid ( $\text{C}_2\text{H}_5\text{NO}_2$ ).

### IDENTIFICATION

- **A.** Tablets produce a purple color when mixed with an acidic solution of ferric chloride.

### ASSAY

- **PROCEDURE**  
*Ferric chloride solution:* 20 mg/mL of ferric chloride in 0.1 N hydrochloric acid  
*Standard solution:* 500  $\mu\text{g/mL}$  of USP Acetohydroxamic Acid RS in 0.1 N hydrochloric acid  
*Sample solution:* Weigh, and finely powder NLT 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of acetohydroxamic acid, to a 1000-mL volumetric flask, add about 500 mL of 0.1 N hydrochloric acid, and shake for 1 min. Dilute with 0.1 N hydrochloric acid to volume, and mix. Filter, discarding the first 40 mL of the filtrate. Use the clear filtrate.  
*Blank:* 0.1 N hydrochloric acid  
*Analysis*  
*Samples:* *Standard solutions*, *Sample solution*, and *Blank*  
 Transfer 10.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* to separate 100-mL volumetric flasks. To each flask add 50 mL of 0.1 N hydrochloric acid and 10.0 mL of *Ferric chloride solution*, and dilute with 0.1 N hydrochloric acid to volume. Without delay, concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 502 nm, using the *Blank* to set the instrument.  
 Calculate the percentage of labeled amount of acetohydroxamic acid ( $\text{C}_2\text{H}_5\text{NO}_2$ ) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of USP Acetohydroxamic Acid RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = nominal concentration of acetohydroxamic acid in the *Sample solution* ( $\mu\text{g/mL}$ )

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION, Procedure for a Pooled Sample (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Analysis: Calculate the percentage of the labeled amount of acetohydroxamic acid ( $C_2H_5NO_2$ ) dissolved, using the procedure in the Assay, using a filtered portion of the solution under test as *Sample solution* in comparison with a *Standard solution* having a known concentration of USP Acetohydroxamic Acid RS in Medium.

Tolerances: NLT 85% (Q) of the labeled amount of acetohydroxamic acid ( $C_2H_5NO_2$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

## IMPURITIES

### • LIMIT OF HYDROXYLAMINE

Buffer: 1.36 g/L of monobasic potassium phosphate in water, adjusted with 1 M potassium hydroxide to a pH of 7.4

Solution A: 1 mg/mL of pyridoxal 5-phosphate monohydrate in Buffer, prepared in a low-actinic flask fresh before use

Standard stock solution: 2.0 mg/mL of hydroxylamine hydrochloride in water

Standard solutions: Transfer 5.0, 10.0, and 15.0 mL of the Standard stock solution to separate 100-mL volumetric flasks, and dilute with water to volume.

Sample solution: Weigh, and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to about 1500 mg of acetohydroxamic acid to a 50-mL stoppered centrifuge tube. Add 30.0 mL of water, shake for about 2 min, and centrifuge. Pipet 15.0 mL of the clear solution into a 50-mL beaker, add just enough water to cover the electrode of a calibrated pH meter, and while stirring, adjust with 0.5 M potassium hydroxide to a pH of 7.4. Quantitatively transfer the contents of the beaker with the aid of small portions of water to a 50-mL volumetric flask, dilute with water to volume, and mix.

Blank: Water

### Analysis

Samples: Standard solutions, Sample solution, and Blank. Transfer 2.0 mL of each Standard solution, the Sample solution, and Blank into separate 100-mL volumetric flasks. To each flask add 4.0 mL of Solution A. After 8 min, accurately timed, dilute the contents of each flask with Buffer to volume.

Immediately determine the fluorescence intensities of the solutions from the Standard solutions and the Sample solution in a fluorometer at an excitation wavelength of 350 nm and an emission wavelength of 450 nm, setting the instrument to zero with the Blank. Determine the best-fit straight line from the fluorescence intensities of the three Standard solutions versus the hydroxylamine hydrochloride concentrations, in  $\mu\text{g/mL}$ . From the best-fit straight line, determine the concentration, in  $\mu\text{g/mL}$ , of hydroxylamine hydrochloride in the Sample solution.

Calculate the percentage of hydroxylamine in the portion of Tablets taken:

$$\text{Result} = (C_U/C) \times (M_{r1}/M_{r2}) \times 100$$

$C_U$  = concentration of hydroxylamine hydrochloride in the Sample solution ( $\mu\text{g/mL}$ )

$C$  = nominal concentration of acetohydroxamic acid in the Sample solution ( $\mu\text{g/mL}$ )

$M_{r1}$  = molecular weight of hydroxylamine, 33.03

$M_{r2}$  = molecular weight of hydroxylamine hydrochloride, 69.50

Acceptance criteria: NMT 0.5%

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE:

Preserve in tight containers.

### • USP REFERENCE STANDARDS (11)

USP Acetylcholine Chloride RS

## Acetylcholine Chloride

$C_7H_{16}ClNO_2$  181.66

Ethanaminium, 2-(acetoxy)-N,N,N-trimethyl-, chloride;

Choline acetate (ester) chloride [60-31-1].

## DEFINITION

Acetylcholine Chloride contains NLT 98.0% and NMT 102.0% of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ), calculated on the dried basis.

## IDENTIFICATION

### • A. INFRARED ABSORPTION (197K)

### • B.

Sample solution: 100 mg/mL in water

Analysis: To 5 mL of Sample solution add 5 mL of silver nitrate TS.

Acceptance criteria: A white, curdy precipitate, which is soluble in ammonium hydroxide but insoluble in nitric acid, is formed.

## ASSAY

### • PROCEDURE

Sample: 400 mg of Acetylcholine Chloride

Analysis: Dissolve in 15 mL of water in a glass-stoppered conical flask, add 40.0 mL of 0.1 N sodium hydroxide VS, and heat on a steam bath for 30 min. Insert the stopper, allow to cool, add phenolphthalein TS, and titrate the excess alkali with 0.1 N sulfuric acid VS. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*). Each mL of 0.1 N sodium hydroxide is equivalent to 18.17 mg of  $C_7H_{16}ClNO_2$ .

Acceptance criteria: 98.0%–102.0% on the dried basis

## OTHER COMPONENTS

### • CONTENT OF CHLORIDE

Sample: 280 mg of Acetylcholine Chloride

Analysis: Dissolve the Sample in 140 mL of water, and add 1 mL of dichlorofluorescein TS. Titrate with 0.1 N silver nitrate VS until the silver chloride flocculates and the mixture acquires a faint pink color. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl.

Acceptance criteria: 19.3%–19.8% of Cl on the dried basis

## IMPURITIES

### • RESIDUE ON IGNITION (281):

NMT 0.2%

## SPECIFIC TESTS

### • MELTING RANGE OR TEMPERATURE, Class I (741):

149°–152°

### • ACIDITY

Sample: 100 mg of Acetylcholine Chloride

Analysis: Dissolve the Sample in 10 mL of recently boiled water, and add at once 1 drop of bromothymol blue TS.

Acceptance criteria: NMT 0.50 mL of 0.010 N sodium hydroxide is required to produce a color change.

• **LOSS ON DRYING** (731)

Analysis: Dry a sample at 105° for 3 h.

Acceptance criteria: NMT 1.0%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in a tight container, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Acetylcholine Chloride RS

## Acetylcholine Chloride for Ophthalmic Solution

**DEFINITION**

Acetylcholine Chloride for Ophthalmic Solution is a sterile mixture of Acetylcholine Chloride with Mannitol or other suitable diluent, prepared by freeze-drying. Each container contains NLT 90.0% and NMT 115.0% of the labeled amount of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ).

**IDENTIFICATION**

• **A.**

**Standard solution:** 10 mg/mL of USP Acetylcholine Chloride RS

**Sample solution:** 10 mg/mL of acetylcholine chloride

**Chromatographic system**

(See Chromatography (621), Thin-Layer Chromatography.)

**Adsorbent:** 0.25-mm layer of aluminum oxide

**Application volume:** 2  $\mu$ L

**Developing solvent system:** Mix butyl alcohol, glacial acetic acid, and water (40:10:50). Allow the layers to separate completely. Use the upper layer.

**Spray reagent A:** Freshly prepared solution of 5 mg/mL of cobaltous chloride prepared as follows. Dissolve the required amount of cobaltous chloride in 50% of the final volume of water, and dilute with 50% alcohol. [NOTE—This solution is freshly prepared.]

**Spray reagent B:** Freshly prepared potassium ferrocyanide solution prepared as follows. Dissolve 1.0 g of potassium ferrocyanide in 100 mL of water, and dilute with 50 mL of alcohol.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Develop the chromatogram, without delay, in a vapor-saturated chamber containing the *Developing solvent system*. Allow the solvent front to move about 10 cm beyond the initial spotting line. Dry the plate with a current of warm air. Immediately spray the plate with *Spray reagent A*. Dry the plate as before, and immediately spray the plate with *Spray reagent B*. Dry the plate with a current of warm air.

**Acceptance criteria:** The  $R_f$  value and color of the principal spot from the *Sample solution* correspond to those from the *Standard solution*.

• **B.**

**Sample solution:** Nominally 10 mg/mL of acetylcholine chloride

**Analysis:** To 2 mL of *Sample solution* add 1 drop of nitric acid and 1 mL of silver nitrate TS.

**Acceptance criteria:** A curdy, white precipitate, soluble in an excess of 6 N ammonium hydroxide, is formed.

**ASSAY**

• **PROCEDURE**

**Mobile phase:** Add 1.03 g of sodium 1-heptanesulfonate to a mixture of 900 mL of water and 10 mL of methanol. Adjust with ammonium hydroxide or glacial acetic acid to a pH of 4.0. Add 50 mL of acetonitrile. Dilute with water to 1 L. [NOTE—A slight variation of the amount of acetonitrile may be required to improve resolution or adjust retention time.]

**Standard solution:** A quantity of USP Acetylcholine Chloride RS in *Mobile phase*, to obtain a solution having a known concentration equal to that of the acetylcholine chloride in the *Sample solution*

**Sample solution:** Transfer the contents of 1 container of Acetylcholine Chloride for Ophthalmic Solution to a 10-mL volumetric flask with the aid of *Mobile phase*, and dilute with *Mobile phase* to volume.

**System suitability solution:** 0.2% each of acetylcholine chloride and choline chloride

**Chromatographic system**

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** Refractive index

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 50  $\mu$ L

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between acetylcholine chloride and choline chloride, *System suitability solution*

**Relative standard deviation:** NMT 3.5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ) in the container taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acetylcholine Chloride RS in the *Standard solution* (mg/mL)

$V$  = volume of the *Sample solution*, 10 mL

$L$  = label claim (mg/vial)

**Acceptance criteria:** 90.0%–115.0%

**PERFORMANCE TESTS**

• **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

**SPECIFIC TESTS**

• **STERILITY TESTS** (71): Meets the requirements

• **ACIDITY**

**Analysis:** Dissolve an amount of Acetylcholine Chloride for Ophthalmic Solution equivalent to 100 mg of acetylcholine chloride in 10 mL of recently boiled water. Add at once 1 drop of bromothymol blue TS.

**Acceptance criteria:** NMT 0.50 mL of 0.010 N sodium hydroxide is required to produce a color change.

• **WATER DETERMINATION, Method I** (921)

**Analysis:** Perform the titration in the original container, observing precautions against contact with water or moist atmosphere. Adjust the concentration of the reagent so that the titration volume approaches but does not exceed the capacity of the container. Titrate to an amber color that persists for 15 s after mixing.

**Acceptance criteria:** NMT 1.0%

• **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* and *Implanted Drug Products* (1), *Specific Tests*, *Completeness* and *clarity* of solutions.

**ADDITIONAL REQUIREMENTS**

**Change to read:**

• **PACKAGING AND STORAGE:** Preserve in tight containers as described in *Packaging and Storage Requirements* (659), *Injection Packaging*, *Packaging for constitution* (CN 1-May-2017), and store at controlled room temperature.

- **USP REFERENCE STANDARDS (11)**  
USP Acetylcholine Chloride RS

## Acetylcysteine

$C_5H_9NO_3S$   
L-Cysteine, N-acetyl-;  
N-Acetyl-L-cysteine [616-91-1].

163.19

### DEFINITION

Acetylcysteine contains NLT 98.0% and NMT 102.0% of  $C_5H_9NO_3S$ , calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

### ASSAY

- **PROCEDURE**

**Mobile phase:** 6.8 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 3.0.

**Sodium metabisulfite solution:** 0.5 mg/mL of sodium metabisulfite in water, freshly prepared

**Internal standard solution:** 5 mg/mL of USP L-Phenylalanine RS in Sodium metabisulfite solution

**Standard stock solution:** 10 mg/mL of USP Acetylcysteine RS in Sodium metabisulfite solution

**Standard solution:** 0.5 mg/mL of USP Acetylcysteine RS and 0.25 mg/mL of USP L-Phenylalanine RS in Sodium metabisulfite solution from Standard stock solution and Internal standard solution

**Sample stock solution:** 10 mg/mL of Acetylcysteine in Sodium metabisulfite solution

**Sample solution:** 0.5 mg/mL of Acetylcysteine and 0.25 mg/mL of USP L-Phenylalanine RS in Sodium metabisulfite solution from Sample stock solution and Internal standard solution

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 5  $\mu$ L

#### System suitability

**Sample:** Standard solution

[NOTE—The relative retention times for acetylcysteine and L-phenylalanine are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 6 between acetylcysteine and L-phenylalanine

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** Standard solution and Sample solution  
Calculate the percentage of acetylcysteine ( $C_5H_9NO_3S$ ) in the portion of Acetylcysteine taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of acetylcysteine to L-phenylalanine from the Sample solution

$R_S$  = peak response ratio of acetylcysteine to L-phenylalanine from the Standard solution

$C_S$  = concentration of USP Acetylcysteine RS in the Standard solution (mg/mL)

$C_U$  = concentration of acetylcysteine in the Sample solution (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.5%

### Delete the following:

- **HEAVY METALS, Method II (231)**

[CAUTION—Exercise care because explosion may occur.]

**Analysis:** In a dropwise manner, wet the sample with 2 mL of nitric acid, and proceed as directed for the Test preparation.

Acceptance criteria: NMT 10 ppm (Official 1-Jan-2018)

### SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation (781S)**

**Buffer:** Mix 29.5 mL of 1 N sodium hydroxide, 50 mL of 1 M monobasic potassium phosphate, and sufficient water to make 100 mL. Adjust to a pH of  $7.0 \pm 0.1$  by adding more of either solution, as necessary.

**Sample solution:** In a 25-mL volumetric flask, mix 1.25 g with 1 mL of edetate disodium solution (1 in 100), add 7.5 mL of sodium hydroxide solution (1 in 25), and mix to dissolve. Dilute with Buffer to volume.

Acceptance criteria:  $+21^\circ$  to  $+27^\circ$

- **pH (791):** 2.0–2.8 in a solution (1 in 100)

- **LOSS ON DRYING (731):** Dry a sample at a pressure of about 50 mm of mercury at  $70^\circ$  for 4 h; it loses NMT 1.0% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS (11)**

USP Acetylcysteine RS

USP L-Phenylalanine RS

## Acetylcysteine Solution

### DEFINITION

Acetylcysteine Solution is a sterile solution of Acetylcysteine in water, prepared with the aid of Sodium Hydroxide. It contains NLT 90.0% and NMT 110.0% of the labeled amount of acetylcysteine ( $C_5H_9NO_3S$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

**Sample solution:** Place 10 mL in a suitable beaker, and adjust to a pH of 2 (pH indicator paper), using 3 N hydrochloric acid. Add up to 2 g of finely powdered sodium chloride, in two portions of 200 mg each initially and then in smaller portions of 25 mg, stirring after each addition until the sodium chloride dissolves and a precipitate is formed. The precipitate appears as a very fine powder, and the solution turns cloudy. If no precipitate forms, add an additional drop of 3 N hydrochloric acid, and stir until the precipitate forms. Allow to stand at room temperature for 15 min, and collect the residue by suction filtration. Use the acetylcysteine so obtained after being dried at a pressure of 50 mm of mercury at  $70^\circ$  for 4 h.

Acceptance criteria: Meets the requirements

### ASSAY

- **PROCEDURE**

**Solution A:** 0.5 mg/mL of sodium metabisulfite solution in water, freshly prepared

**Solution B:** 0.5 mg/mL of sodium bisulfite solution

**Mobile phase:** 6.8 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 3.0.

**Internal standard solution:** 5 mg/mL of USP L-Phenylalanine RS in *Solution A*

**Standard stock solution:** 10 mg/mL of USP Acetylcysteine RS in *Solution A*

**Standard solution:** 0.5 mg/mL of USP Acetylcysteine RS and 0.25 mg/mL of USP L-Phenylalanine RS in *Solution A* from *Standard stock solution* and *Internal standard solution*

**Sample stock solution:** Equivalent to 10 mg/mL of acetylcysteine from the volume of *Solution in Solution B*

**Sample solution:** 0.5 mg/mL of acetylcysteine and 0.25 mg/mL of USP L-Phenylalanine RS in *Solution A* from *Standard stock solution* and *Internal standard solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 5 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 6 between acetylcysteine and L-phenylalanine

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times for acetylcysteine and L-phenylalanine are about 0.5 and 1.0, respectively.]

Calculate the percentage of the labeled amount of acetylcysteine ( $C_5H_9NO_3S$ ) in the portion of *Solution* taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of acetylcysteine to L-phenylalanine from the *Sample solution*

$R_S$  = peak response ratio of acetylcysteine to L-phenylalanine from the *Standard solution*

$C_S$  = concentration of USP Acetylcysteine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acetylcysteine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

• **pH** <791>: 6.0–7.5

• **STERILITY TESTS** <71>: Meets the requirements

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-unit or multiple-unit tight containers that effectively exclude oxygen, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** <11>

USP Acetylcysteine RS

USP L-Phenylalanine RS

### Acetylcysteine and Isoproterenol Hydrochloride Inhalation Solution

» Acetylcysteine and Isoproterenol Hydrochloride Inhalation Solution is a sterile solution of Acetylcysteine and Isoproterenol Hydrochloride in water. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetylcysteine ( $C_5H_9NO_3S$ ), and not less than 90.0 percent and not more than

115.0 percent of the labeled amount of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, tightly closed with a glass or polyethylene closure, and store at controlled room temperature.

**Labeling**—The label indicates that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

#### USP Reference standards <11>—

USP Acetylcysteine RS

USP Isoproterenol Hydrochloride RS

USP L-Phenylalanine RS

**Color and clarity**—Using the Inhalation Solution as the *Test solution*, proceed as directed for *Color and clarity* under *Isoproterenol Inhalation Solution*.

#### Identification—

**A:** Place 2 mL in a 10-mL beaker, and adjust with 3 N hydrochloric acid to a pH of about 3 (pH indicator paper). Add 500 mg to 1 g of finely powdered sodium chloride, in two portions of about 200 mg each initially, and then in smaller portions (about 25 mg), stirring after each addition, until a precipitate is formed. Allow to stand at room temperature for 15 minutes, and collect the residue by suction filtration: the acetylcysteine so obtained, after being dried as directed in the test for *Loss on drying* under *Acetylcysteine*, responds to the *Identification* test under *Acetylcysteine*.

**B:** *Ferro-Citrate Solution* and *Buffer Solution*—Prepare as directed under *Epinephrine Assay* <391>.

**Procedure**—Place a volume of Inhalation Solution, equivalent to about 0.26 mg of isoproterenol hydrochloride, in a test tube with 3 mL of 0.1 M mercuric chloride, and mix. Add 100 µL of *Ferro-Citrate Solution* and 1.0 mL of *Buffer Solution*, and mix: the presence of isoproterenol hydrochloride is confirmed by the development of a purple color.

**Sterility Tests** <71>: meets the requirements.

**pH** <791>: between 6.0 and 7.0.

#### Assay for acetylcysteine—

*Mobile phase*, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the Assay under *Acetylcysteine*.

**Assay preparation**—Pipet a volume of Inhalation Solution, equivalent to about 1000 mg of acetylcysteine, into a 100-mL volumetric flask, dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix. Pipet 10 mL of this solution and 10 mL of *Internal standard solution* into a 200-mL volumetric flask, dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Acetylcysteine*. Calculate the quantity, in mg, of  $C_5H_9NO_3S$  in each mL of the Inhalation Solution taken by the formula:

$$2000(C/V)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Acetylcysteine RS in the *Standard preparation*; V is the volume, in mL, of Inhalation Solution taken; and  $R_U$  and  $R_S$  are the ratios of the peak response of acetylcysteine to that of DL-phenylalanine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for isoproterenol hydrochloride—

*Mobile phase*—Dissolve 13.6 g of monobasic potassium phosphate in 1000 mL of water, and pass through a membrane filter having a 0.45-µm porosity. Add 20.0 mL of methanol, mix, and degas.

*Internal standard solution*—Place about 150 mg of acetaminophen in a 500-mL volumetric flask, add 5 mL of glacial acetic acid, dilute with water to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in 0.05 M sodium metabisulfite to obtain a solution having a known concentration of 0.15 mg per mL. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with 0.2 M acetic acid to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Inhalation Solution, equivalent to about 1.5 mg of isoproterenol hydrochloride, and 10 mL of *Internal standard solution* to a 25-mL volumetric flask, add dilute glacial acetic acid (1 in 100) to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 40-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for isoproterenol hydrochloride and 1.0 for acetaminophen; the resolution,  $R_s$ , between isoproterenol hydrochloride and acetaminophen is not less than 6; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ) in each mL of the Inhalation Solution taken by the formula:

$$(25C/V)(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Inhalation Solution taken; and  $R_U$  and  $R_S$  are the ratios of the peak responses of isoproterenol hydrochloride to those of acetaminophen obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acitretin

$C_{21}H_{26}O_3$  326.43  
2,4,6,8-Nonatetraenoic acid, 9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-, (*all-E*); (*all-E*)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-2,4,6,8-nonatetraenoic acid [55079-83-9].

### DEFINITION

Acitretin contains NLT 98.0% and NMT 102.0% of  $C_{21}H_{26}O_3$ , calculated on the dried basis.

**[CAUTION]**—Acitretin is a teratogen. Great care should be taken when handling to avoid inhalation of dust or contact with skin.]

[NOTE—Use low-actinic glassware and perform all tests under yellow and subdued light.]

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

[NOTE—Store the solutions at 4° before injection.]

**Mobile phase:** Alcohol, glacial acetic acid, and water (92:0.3:8)

**System suitability stock solution:** 0.01 mg/mL each of USP Acitretin RS and USP Tretinoin RS in alcohol.

[NOTE—Dissolve in tetrahydrofuran before diluting with alcohol.]

**System suitability solution:** 0.25  $\mu$ g/mL each of USP Acitretin RS and USP Tretinoin RS in alcohol, from *System suitability stock solution*

**Standard solution:** 0.1 mg/mL of USP Acitretin RS in alcohol. [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol. The final concentration of tetrahydrofuran in the preparation will be 2%.]

**Sample stock solution:** 0.25 mg/mL of Acitretin in tetrahydrofuran and alcohol (1:19). [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol.]

**Sample solution:** 0.1 mg/mL of Acitretin in alcohol, from *Sample stock solution*

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Acitretin RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION (711)****Test 1**

**Medium:** 3% sodium lauryl sulfate in deaerated water, pH 9.6–10.0; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

Determine the amount of acitretin ( $C_{21}H_{26}O_3$ ) dissolved using the following method.

**Standard solution:** Transfer about 14 mg of USP Acitretin RS to a 500-mL volumetric flask. Dissolve in 50 mL of alcohol, and dilute with *Medium* to volume.

**For Capsules labeled to contain 10 mg:** Transfer 20 mL of this solution to a 50-mL volumetric flask, and dilute with *Medium* to volume.

**Sample solution:** Use portions of the solution under test passed through a suitable filter of 0.45-μm pore size.

**Capsule shell solution:** Dissolve 6 clean empty-shell Capsules in 900 mL of *Medium*.

**Analytical wavelength:** 347 nm

**Cell length:** 2 mm

**Blank:** *Medium*

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Capsule shell solution*

Calculate the amount of acitretin ( $C_{21}H_{26}O_3$ ) dissolved:

$$\text{Result} = [(A_U - A_{CS})/A_S] \times (C_S/L) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*  
 $A_{CS}$  = Capsule shell correction, calculated as shown below  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of the appropriate *Standard solution* (mg/mL)  
 $L$  = Capsule label claim (mg)  
 $V$  = volume of *Medium*, 900 mL

The Capsule shell correction,  $A_{CS}$ , is calculated:

$$A_{CS} = A_{CSS}/N$$

$A_{CSS}$  = absorbance of the *Capsule shell solution*  
 $N$  = number of Capsule shells used to prepare the *Capsule shell solution*

**Tolerances:** NLT 85% (Q) of the labeled amount of acitretin ( $C_{21}H_{26}O_3$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Tier 1**

**Medium:** 3% sodium lauryl sulfate in deaerated water, pH 9.6–10.0 (adjusted with 1 N sodium hydroxide); 900 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

Determine the amount of acitretin ( $C_{21}H_{26}O_3$ ) dissolved using the following method.

**Tier 2**

**Medium A:** Prepare a solution containing pancreatin with NMT 1750 USP units of protease activity/L in deaerated water, pH 8.0 (adjusted with 1% sodium hydroxide); 450 mL, use immediately.

**Medium B:** 6% sodium lauryl sulfate in deaerated water, pH 10.5 (adjusted with 1% sodium hydroxide); 450 mL

**Apparatus 1:** 100 rpm

**Time:** 10 min *Medium A*; 20 min *Medium A* with the addition of *Medium B*

**Mobile phase:** Methanol, water, and glacial acetic acid (750:250:1)

**Standard stock solution:** 280 μg/mL of USP Acitretin RS in absolute alcohol. Use sonication to dissolve.

**Standard solution:** 20 μg/mL of USP Acitretin RS in *Medium* under *Tier 1*, from *Standard stock solution*

**Sample solution:** Pass a portion of the solution under test through a suitable glass filter with 1-μm pore size, discard first few mL, and use the filtrate for analysis.

**Dissolution procedure:** Perform the test using the conditions under *Tier 1*. In the presence of cross-linking repeat the test with new Capsules using the conditions under *Tier 2* as follows. After 10 min, stop the dissolution bath and timer (do not lift the baskets), and add 450 mL of *Medium B* pre-equilibrated at  $37 \pm 0.5^\circ$ . Restart the timer and bath, and after 5 min check the pH of the medium and adjust to a range of 9.6–10.0 with 1% sodium hydroxide. Continue dissolution for an additional 15 min.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** 360 nm

**Columns**

**Guard:** 4-mm × 1-cm; 5-μm packing L1

**Analytical:** 4.6-mm × 5-cm; 5-μm packing L1

**Temperatures**

**Column:**  $35^\circ$

**Autosampler:**  $40^\circ$

**Flow rate:** 2.0 mL/min

**Injection volume:** 10 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acitretin ( $C_{21}H_{26}O_3$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Acitretin RS in the *Standard solution* (mg/mL)  
 $L$  = label claim (mg/Capsule)  
 $V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 85% (Q) of the labeled amount of acitretin ( $C_{21}H_{26}O_3$ ) is dissolved.

**• UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES****• ORGANIC IMPURITIES: LIMIT OF DEGRADATION PRODUCTS**

Diluent, Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

**Analysis**

Sample: Sample solution

Calculate the percentage of each degradation product in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each individual impurity

$r_T$  = sum of the responses of all the peaks

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Acicretin related compound A(2Z-isomer) <sup>a</sup>	0.84	0.5
Acicretin	1.0	—
6Z-Isomer <sup>b</sup>	1.09	—
Any unspecified impurity	—	0.4
Total unspecified impurities	—	0.8

<sup>a</sup> [(2Z,4E,6E,8E)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid] (C<sub>21</sub>H<sub>26</sub>O<sub>3</sub> 326.43).

<sup>b</sup> (2E,4E,6Z,8E)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** When more than one Dissolution test is given, the labeling states the test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**  
USP Acicretin RS

**Acyclovir**

C<sub>8</sub>H<sub>11</sub>N<sub>5</sub>O<sub>3</sub> 225.20

6H-Purin-6-one, 2-amino-1,9-dihydro-9-[(2-hydroxyethoxy)methyl]-.

9-[(2-Hydroxyethoxy)methyl]guanine [59277-89-3].

» Acyclovir contains not less than 98.0 percent and not more than 101.0 percent of C<sub>8</sub>H<sub>11</sub>N<sub>5</sub>O<sub>3</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers. Store at room temperature. Protect from light and moisture.

**USP Reference standards (11)**—

USP Acyclovir RS

**Identification**—

A: Infrared Absorption (197K).

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay and limit for guanine.

**Water Determination, Method I (921):** not more than 6.0%.

**Ordinary impurities (466)**—

Test solution: dimethyl sulfoxide.

Standard solution: dimethyl sulfoxide.

Eluant: a mixture of chloroform, methanol, and ammonium hydroxide (80:20:2).

Visualization: 1.

Application volume: 5  $\mu$ L.

Limit: 1%.

**Assay and limit for guanine**—

**Mobile phase**—Prepare a filtered and degassed solution of glacial acetic acid in water (1 in 1000). Make adjustments if necessary (see System Suitability under Chromatography (621)).

**System suitability solution 1**—Dissolve accurately weighed quantities of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 0.1 mg of each per mL.

**System suitability solution 2**—Dissolve an accurately weighed quantity of guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.7  $\mu$ g per mL.

**Guanine standard preparation**—Transfer about 8.75 mg of guanine, accurately weighed, to a 500-mL volumetric flask. Dissolve in 50 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having a concentration of about 0.7  $\mu$ g per mL.

**Standard preparation**—Dissolve about 25 mg of USP Acyclovir RS, accurately weighed, in 5 mL of 0.1 N sodium hydroxide in a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having a known concentration of about 0.1 mg of USP Acyclovir RS per mL.

**Assay preparation**—Dissolve about 100 mg of Acyclovir, accurately weighed, in 20 mL of 0.1 N sodium hydroxide in a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph System suitability solution 1, and record the peak responses as directed for Procedure: the resolution,  $R$ , between acyclovir and guanine is not less than 2.0; the tailing factor for the analyte peak is not more than 2; and the relative standard deviation for replicate injections for the acyclovir peak is not more than 2.0%. Chromatograph System suitability solution 2, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the Standard preparation, the Guanine standard preparation, and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in  $\mu$ g, of guanine in the portion of Acyclovir taken by the formula:

$$1000C(r_U/r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of guanine in the Guanine standard preparation; and  $r_U$  and  $r_S$  are the peak responses due to guanine in the Assay preparation and the Guanine standard preparation, respectively: not more than

0.7% of guanine is found. Calculate the quantity, in mg, of  $C_8H_{11}N_5O_3$  in the portion of Acyclovir taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acyclovir RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses due to acyclovir in the *Assay preparation* and the *Standard preparation*, respectively.

## Acyclovir Capsules

### DEFINITION

Acyclovir Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** 0.02 M acetic acid

**System suitability solution A:** 0.1 mg/mL each of USP Acyclovir RS and guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**System suitability solution B:** 2.0 µg/mL of guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Standard solution:** 0.1 mg/mL of USP Acyclovir RS. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Sample solution:** Nominally 0.1 mg/mL of acyclovir prepared as follows. Transfer the contents of Capsules equivalent to 10 mg of acyclovir (NLT 10 Capsules) to a 100-mL volumetric flask. Dissolve in 10 mL of 0.1 N sodium hydroxide, dilute to volume with water, and filter.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.2-mm × 25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in *System suitability solution A*.]

#### Suitability requirements

**Resolution:** NLT 2.0 between guanine and acyclovir, *System suitability solution A*

**Relative standard deviation:** NMT 2.0% for the acyclovir peak, *System suitability solution A*

**Relative standard deviation:** NMT 2.0%, *System suitability solution B*

**Analysis:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the *Sample solution*

$r_S$  = peak response of the *Standard solution*

$C_S$  = concentration of USP Acyclovir RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

### PERFORMANCE TESTS

#### • DISSOLUTION (711)

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Detector:** UV 254 nm

**Standard solution:** USP Acyclovir RS in *Medium*

**Sample solutions:** Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

**Analysis:** Determine the amount of acyclovir ( $C_8H_{11}N_5O_3$ ) dissolved from UV absorption at the wavelength of maximum absorption on filtered portions of the solution under test.

**Tolerances:** NLT 75% (Q) of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Content Uniformity*

### IMPURITIES

#### • PROCEDURE

**Mobile phase, System suitability solution A, System suitability solution B, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Analysis:** *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses for all of the peaks

#### Acceptance criteria

**Guanine:** NMT 2.0%

**Any individual impurity:** NMT 0.5%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light and moisture.

#### • USP REFERENCE STANDARDS (11)

USP Acyclovir RS

## Acyclovir for Injection

### DEFINITION

Acyclovir for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** 0.02 M acetic acid

**System suitability solution A:** 0.1 mg/mL each of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide

**System suitability solution B:** 2.0 µg/mL of guanine in 0.1 N sodium hydroxide

**Standard solution:** 0.1 mg/mL of USP Acyclovir RS in 0.1 N sodium hydroxide

**Sample solution:** Nominally 0.1 mg/mL of acyclovir prepared as follows. Constitute 1 vial of Acyclovir for Injection with water. Transfer an amount, equivalent to 10 mg of acyclovir, to a 100-mL volumetric flask, and dilute with water to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.2-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

#### System suitability

Samples: System suitability solution A and System suitability solution B

[NOTE—The relative retention times for guanine and acyclovir are 0.6 and 1.0, respectively, in System suitability solution A.]

#### Suitability requirements

Resolution: NLT 2.0 between guanine and acyclovir, System suitability solution A

Relative standard deviation: NMT 2.0% for the acyclovir peak, System suitability solution A

Relative standard deviation: NMT 2.0%, System suitability solution B

#### Analysis

Calculate the percentage of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Acyclovir for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the Sample solution

$r_S$  = peak response of the Standard solution

$C_S$  = concentration of USP Acyclovir RS in the Standard solution (mg/mL)

$C_U$  = concentration of the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

#### IMPURITIES

##### PROCEDURE

Solution A: 0.17 M acetic acid and methanol (125:8)

Solution B: Methanol

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
45	65	35
46	100	0
56	100	0

System suitability solution: 0.5 µg/mL each of purine and USP Acyclovir RS in Solution A

Acyclovir standard solution: 5 µg/mL of USP Acyclovir RS in Solution A

Guanine solution: 0.05 mg/mL of guanine prepared as follows. Dissolve 25 mg of guanine in 50 mL of 0.1 N sodium hydroxide in a 500-mL volumetric flask, and bring the solution to volume with water.

Standard solution A: 0.5 µg/mL of Acyclovir standard solution in Solution A

Standard solution B: 5 µg/mL of Guanine solution in Solution A

Sample solution: Equivalent to 0.5 mg/mL of acyclovir from a mixture of NLT 10 reconstituted vials of Acyclovir for Injection in Solution A

#### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

#### System suitability

Samples: System suitability solution, Standard solution A, and Standard solution B

[NOTE—Typical retention times for guanine and acyclovir of Standard solution A and Standard solution B are 5.8 and 14 min, respectively.]

#### Suitability requirements

Resolution: NLT 2.0 between purine and acyclovir, System suitability solution

Relative standard deviation: NMT 1% for the acyclovir and the guanine peaks, Standard solution A and Standard solution B

#### Analysis 1

Calculate the percentage of guanine in the Acyclovir for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for guanine, if present, in the Sample solution

$r_S$  = peak response of guanine in the Standard solution

$C_S$  = concentration of guanine in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acyclovir in the Sample solution (mg/mL)

Acceptance criteria 1: NMT 1.0% guanine

#### Analysis 2

Calculate the percentage of each other impurity in the portion of Acyclovir for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for each impurity

$r_S$  = peak response of acyclovir in the Standard solution

$C_S$  = concentration of USP Acyclovir RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acyclovir in the Sample solution (mg/mL)

Acceptance criteria 2: NMT 0.15% for any peak having a relative retention time of about 0.7 compared to the acyclovir peak; NMT 0.5% for any other individual impurity; and NMT 1.0% for the total of all other impurities

#### SPECIFIC TESTS

- **PH (791):** 11.0–12.5, 50 mg/mL of acyclovir
- **WATER DETERMINATION, Method I (921):** NMT 5.5%
- **STERILITY TESTS (71):** Meets the requirements
- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements
- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.174 USP Endotoxin Unit/mg of acyclovir
- **OTHER REQUIREMENTS:** Meets the requirements for labeling in Labeling (7), Labels and Labeling for Injectable Products

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light.
- **USP REFERENCE STANDARDS (11)**  
USP Acyclovir RS  
USP Endotoxin RS

## Acyclovir Ointment

#### DEFINITION

Acyclovir Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ), in a suitable ointment base.

#### IDENTIFICATION

- **A.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

Mobile phase: 0.02 M acetic acid

System suitability solution A: 0.1 mg/mL each of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide

System suitability solution B: 2.0 µg/mL of guanine in 0.1 N sodium hydroxide

Standard solution: 0.1 mg/mL of USP Acyclovir RS in 0.1 N sodium hydroxide

Sample solution: Nominally 0.1 mg/mL of acyclovir prepared as follows. Transfer an amount of Ointment, equivalent to 10 mg of acyclovir, to a 100-mL volumetric flask. Dissolve in and dilute with 0.1 N sodium hydroxide to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 3 mL/min

Injection volume: 20 µL

**System suitability**

Samples: System suitability solution A and System suitability solution B

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in System suitability solution A.]

**Suitability requirements**

Resolution: NLT 2.0 between guanine and acyclovir, System suitability solution A

Relative standard deviation: NMT 2.0% for the acyclovir peak, System suitability solution A; NMT 2.0%, System suitability solution B

**Analysis**

Samples: Standard solution and Sample solution  
Calculate the percentage of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Acyclovir RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acyclovir in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL (755):** Meets the requirements

**IMPURITIES**• **LIMIT OF GUANINE**

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 2.0 µg/mL of guanine in 0.1 M sodium hydroxide

**Analysis**

Samples: Standard solution and Sample solution  
Calculate the percentage of guanine in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of guanine from the Sample solution

$r_S$  = peak response of guanine from the Standard solution

$C_S$  = concentration of guanine in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acyclovir in the Sample solution (mg/mL)

Acceptance criteria: NMT 2.0%

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25° in a dry place.
- **USP REFERENCE STANDARDS (11)**  
USP Acyclovir RS

**Acyclovir Oral Suspension****DEFINITION**

Acyclovir Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

Mobile phase: 0.02 M acetic acid

System suitability solution A: 0.1 mg/mL each of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide

System suitability solution B: 2.0 µg/mL of guanine in 0.1 N sodium hydroxide

Standard solution: 0.1 mg/mL of USP Acyclovir RS in 0.1 N sodium hydroxide

Sample stock solution: Nominally 1 mg/mL of acyclovir prepared as follows. Transfer an amount of well-shaken Oral Suspension equivalent to 200 mg of acyclovir to a 200-mL volumetric flask. Add 100 mL of 0.1 N sodium hydroxide, shake by mechanical means for 15 min, and sonicate, if necessary, to dissolve the Oral Suspension completely. Dilute with 0.1 N sodium hydroxide to volume.

Sample solution: Transfer 10.0 mL of the Sample stock solution to a 100-mL volumetric flask, and dilute with water to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 3 mL/min

Injection volume: 20 µL

**System suitability**

Samples: System suitability solution A and System suitability solution B

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in System suitability solution A.]

**Suitability requirements**

Resolution: NLT 2.0 between guanine and acyclovir, System suitability solution A

Relative standard deviation: NMT 2.0% for replicate injections for the acyclovir peak, System suitability solution A

Relative standard deviation: NMT 2.0% for replicate injections, System suitability solution B

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Acyclovir RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

**IMPURITIES**• **LIMIT OF GUANINE**

**Mobile phase, System suitability solution A, System suitability solution B, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** 2.0 µg/mL of guanine in 0.1 M sodium hydroxide

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of guanine in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response for guanine from the *Sample solution*  
 $r_S$  = peak response for guanine from the *Standard solution*  
 $C_S$  = concentration of guanine in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 2.0%

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): Its total count does not exceed  $10^1$  cfu/mL, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **PH** (791): 4.5–7.0

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements for Oral Suspension packaged in single-unit containers
- **DELIVERABLE VOLUME** (698): Meets the requirements for Oral Suspension packaged in multiple-unit containers

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light.
- **USP REFERENCE STANDARDS** (11)  
USP Acyclovir RS

**Acyclovir Tablets****DEFINITION**

Acyclovir Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Mobile phase:** 0.02 M acetic acid

**System suitability solution A:** 0.1 mg/mL each of USP Acyclovir RS and guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**System suitability solution B:** 2.0 µg/mL of guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Standard solution:** 0.1 mg/mL of USP Acyclovir RS. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Sample solution:** Nominally 0.1 mg/mL of acyclovir prepared as follows. Transfer an amount of finely powdered Tablets equivalent to 10 mg of acyclovir (NLT 10 Tablets) to a 100-mL volumetric flask. Dissolve in 10 mL of 0.1 N sodium hydroxide, dilute with water to volume, and filter.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

**System suitability**

**Samples:** *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in *System suitability solution A*.]

**Suitability requirements**

**Resolution:** NLT 2.0 between guanine and acyclovir, *System suitability solution A*

**Relative standard deviation:** NMT 2.0% for the acyclovir peak, *System suitability solution A*; NMT 2.0%, *System suitability solution B*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Acyclovir RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS**• **DISSOLUTION** (711)

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Instrumental conditions**

**Mode:** UV

**Wavelength:** 254 nm

**Standard solution:** USP Acyclovir RS in *Medium*

**Sample solutions:** Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

**Analysis:** Determine the amount of acyclovir ( $C_8H_{11}N_5O_3$ ) dissolved from UV absorption at the wavelength of maximum absorbance on filtered portions of the solution under test.

**Tolerances:** NLT 80% (Q) of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements for *Weight Variation*

**IMPURITIES****• PROCEDURE**

Mobile phase, System suitability solution A, System suitability solution B, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

**Analysis**

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses for all of the peaks

**Acceptance criteria**

Guanine: NMT 2.0%

Any other impurity: NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light and moisture.

**• USP REFERENCE STANDARDS (11)**

USP Acyclovir RS

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

**System suitability**

Sample: *Standard solution*

**Suitability requirements**

Relative standard deviation: NMT 1.0%

**Analysis**

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of adapalene (C<sub>28</sub>H<sub>28</sub>O<sub>3</sub>) in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Adapalene RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of Adapalene in the *Sample solution* (μg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

**IMPURITIES**

- RESIDUE ON IGNITION (281):** NMT 0.20%

**Adapalene**

C<sub>28</sub>H<sub>28</sub>O<sub>3</sub> 412.52

2-Naphthalenecarboxylic acid, 6-(4-methoxy-3-tricyclo[3.3.1.1<sup>3,7</sup>]dec-1-ylphenyl)-;

6-[3-(1-Adamantyl)-4-methoxyphenyl]-2-naphthoic acid. [106685-40-9].

**DEFINITION**

Adapalene contains NLT 98.0% and NMT 102.0% of adapalene (C<sub>28</sub>H<sub>28</sub>O<sub>3</sub>), calculated on the dried basis.

**IDENTIFICATION****• A. INFRARED ABSORPTION (197K)**

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Mobile phase:** Acetonitrile, tetrahydrofuran, trifluoroacetic acid, and water (21: 16: 0.01: 13)

**Standard stock solution:** 0.2 mg/mL of USP Adapalene RS in *Mobile phase*. Dissolve USP Adapalene RS in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Standard solution:** 40 μg/mL of USP Adapalene RS in *Mobile phase* from the *Standard stock solution*

**Sample stock solution:** 0.2 mg/mL of Adapalene in *Mobile phase*. Dissolve Adapalene in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Sample solution:** 40 μg/mL of Adapalene in *Mobile phase* from the *Sample stock solution*

**Delete the following:**

- HEAVY METALS, Method II (231):** NMT 20 μg/g (Official 1-

Jan-2018)

[NOTE—On the basis of the synthetic route, perform either *Organic Impurities, Procedure 1* or *Organic Impurities, Procedure 2*.]

**• ORGANIC IMPURITIES, PROCEDURE 1**

*Procedure 1* is recommended if adapalene related compounds A and B may be present.

**Mobile phase:** Proceed as directed in the Assay.

**Standard stock solution:** 0.2 mg/mL of USP Adapalene RS, 0.3 mg/mL of USP Adapalene Related Compound A RS, and 0.2 mg/mL of USP Adapalene Related Compound B RS in *Mobile phase*. Dissolve USP Adapalene RS, USP Adapalene Related Compound A RS, and USP Adapalene Related Compound B RS in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Standard solution:** 0.2 μg/mL of USP Adapalene RS, 0.3 μg/mL of USP Adapalene Related Compound A RS, and 0.2 μg/mL of USP Adapalene Related Compound B RS in *Mobile phase* from the *Standard stock solution*

**Sample solution:** 0.2 mg/mL of Adapalene in *Mobile phase*. Dissolve Adapalene in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Chromatographic system:** Proceed as directed in the Assay, except use a run time of NLT two times the retention time of adapalene peak for *Standard solution* and NLT six times the retention time of adapalene peak for *Sample solution*.

**System suitability**

Sample: *Standard solution*

**Suitability requirements**

Relative standard deviation: NMT 3.0% for the adapalene peak

Column efficiency: NLT 3000 theoretical plates for the adapalene peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of adapalene related compounds A and B in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak area of each impurity from the *Sample solution*  
 $r_S$  = peak area of corresponding adapalene related compound A or adapalene related compound B from the *Standard solution*  
 $C_S$  = concentration of corresponding USP Adapalene Related Compound A RS or USP Adapalene Related Compound B RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Adapalene in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified impurity in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak area of each unspecified impurity from the *Sample solution*  
 $r_S$  = peak area of adapalene from the *Standard solution*  
 $C_S$  = concentration of USP Adapalene RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Adapalene in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 1. Disregard any impurity peaks less than 0.05%.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Adapalene related compound A <sup>a</sup>	0.52	0.10
Adapalene	1.0	—
Adapalene related compound B <sup>b</sup>	1.57	0.10
Any individual unspecified impurity	—	0.10
Total impurities	—	0.50

<sup>a</sup> Methyl 6-bromo-2-naphthoate.

<sup>b</sup> Methyl 6-[3-(1-Adamantyl)-4-methoxyphenyl]-2-naphthoate.

**• ORGANIC IMPURITIES, PROCEDURE 2**

*Procedure 2* is recommended if adapalene related compounds E, C, and D may be present.

**Solution A:** Glacial acetic acid and water (0.1:100)

**Solution B:** Acetonitrile and tetrahydrofuran (65:35)

**Mobile phase:** See Table 2.

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	50	50
2.5	50	50
40	28	72
42	28	72
42.1	50	50
50	50	50

**Diluent:** Acetonitrile, tetrahydrofuran, and water (37:20:43)

**Standard stock solution:** 0.2 mg/mL of USP Adapalene RS in tetrahydrofuran

**Standard solution:** 2.0 µg/mL of USP Adapalene RS in *Diluent* from the *Standard stock solution*

**System suitability solution:** 0.2 mg/mL of USP Adapalene RS and 1.2 µg/mL each of USP Adapalene Related Compound C RS, USP Adapalene Related Compound D RS, and USP Adapalene Related Compound E RS prepared by dissolving the standards in tetrahydrofuran equivalent to 50% of the final volume, and diluting with *Diluent* to volume

**Sample solution:** 2.0 mg/mL of Adapalene prepared by dissolving in tetrahydrofuran equivalent to 50% of the final volume, and diluting with *Diluent* to volume

**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L11 with 7.5% carbon loading

**Column temperature:** 30°

**Flow rate:** 1.2 mL/min

**Injection volume:** 25 µL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 4.5 between the adapalene and adapalene related compound C peaks

**Signal-to-noise ratio:** NLT 10 for the adapalene related compound C peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- $r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of adapalene from the *Standard solution*  
 $C_S$  = concentration of adapalene in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Adapalene in the *Sample solution* (mg/mL)  
 $F$  = relative response factor for each individual impurity (see Table 3)  
**Acceptance criteria:** See Table 3. Disregard any impurity peaks less than 0.05%.

**Table 3**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Adapalene related compound E <sup>a</sup>	0.3	1.4	0.3
Hydroxyadapalene <sup>b</sup>	0.5	0.91	0.1
Adapalene related compound C <sup>c</sup>	0.9	0.14	0.1
Adapalene	1.0	—	—
Adapalene related compound D <sup>d</sup>	1.9	0.71	0.2
Any individual unspecified impurity	—	1.0	0.1
Total impurities	—	—	0.5

<sup>a</sup> 2,2'-Binaphthyl-6,6'-dicarboxylic acid.

<sup>b</sup> 6-[3-(3-Hydroxyadamant-1-yl)-4-methoxyphenyl]-2-naphthoic acid.

<sup>c</sup> 2-(Adamant-1-yl)methoxybenzene.

<sup>d</sup> 4,4'-Dimethoxy-3,3'-di(adamant-1-yl)biphenyl.

• **RESIDUAL SOLVENT: LIMIT OF TRIETHYLAMINE**

[NOTE—This test should be performed if triethylamine is used in the manufacturing process.]

**Diluent:** Dimethyl sulfoxide

**Standard solution:** 4.0 µg/mL of USP Triethylamine RS in *Diluent*. Transfer 4.0 mL of this solution to a 20-mL headspace vial, and add 1.0 mL of 1 N NaOH solution.

**Sample solution:** 50 mg/mL of Adapalene in *Diluent*. Transfer 4.0 mL of this solution to a 20-mL headspace vial, and add 1.0 mL of 1 N NaOH solution.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 30-m × 0.53-mm; 3.0-µm coating of G27

**Temperatures**

**Injection port:** 250°

**Detector:** 300°

**Column:** See *Table 4*.

**Table 4**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	5
40	40	240	5

**Headspace operating parameters**

[NOTE—Headspace operating parameters can be modified in order to optimize the performance.]

**Equilibration temperature:** 95°

**Equilibration time:** 15 min

**Transfer line temperature:** 125°

**Pressurization time:** 3 min

**Carrier gas:** Nitrogen

**Flow rate:** 4.8 mL/min

**Injection volume:** 1 mL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 15%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the content, in ppm, of triethylamine in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 10^6$$

$r_U$  = peak response of triethylamine from the *Sample solution*

$r_S$  = peak response of triethylamine from the *Standard solution*

$C_S$  = concentration of triethylamine in the *Standard solution* (mg/mL)

$C_U$  = concentration of Adapalene in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 80 ppm

**SPECIFIC TESTS**

• **LOSS ON DRYING (731)**

**Analysis:** Dry a sample at 105° for 4 h.

**Acceptance criteria:** NMT 0.6%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

• **LABELING:** If a test for *Organic Impurities* other than *Procedure 1* is used, the labeling states the test with which the article complies.

• **USP REFERENCE STANDARDS (11)**

USP Adapalene RS

## Adapalene Gel

**DEFINITION**

Adapalene Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of adapalene ( $C_{28}H_{28}O_3$ ).

**IDENTIFICATION**

• **A. ULTRAVIOLET ABSORPTION (197U)**

**Diluent:** Use *Mobile phase* in the *Assay*.

**Sample stock solution:** Use *Sample stock solution* in the *Assay*.

**Sample solution:** Nominally equivalent to 0.4 µg/mL of adapalene, prepared as follows. Dilute 2.0 mL of *Sample stock solution* with *Diluent* to 100.0 mL. Pass a portion through a Teflon filter of 0.45-µm pore size and use the filtrate.

**Acceptance criteria:** Meets the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

• **PROCEDURE**

**Mobile phase:** Acetonitrile, tetrahydrofuran, trifluoroacetic acid, and water (43: 36: 0.02: 21)

**Standard stock solution:** 0.25 mg/mL of USP Adapalene RS, prepared as follows. Transfer USP Adapalene RS to a suitable volumetric flask, add tetrahydrofuran equivalent to 1% of the final volume, and sonicate to dissolve. Dilute with *Mobile phase* to volume.

**Standard solution:** 20 µg/mL of USP Adapalene RS in *Mobile phase*, from *Standard stock solution*

**Sample stock solution:** Nominally equivalent to 20 µg/mL of adapalene, prepared as follows. Transfer 2.0 g of Gel to a 100-mL volumetric flask, add 25 mL of tetrahydrofuran, and sonicate to dissolve. Add 25 mL of acetonitrile and sonicate for 20 min. Cool to room temperature and dilute with *Diluent* to volume.

**Sample solution:** Pass a portion of *Sample stock solution* through a Teflon filter of 0.45-µm pore size and use the filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 235 nm  
 Column: 4.6-mm × 25-cm; 5-μm packing L1  
 Flow rate: 1 mL/min  
 Injection volume: 20 μL

#### System suitability

Sample: *Standard solution*

#### Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of adapalene ( $C_{28}H_{28}O_3$ ) in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Adapalene RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of adapalene in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

### IMPURITIES

#### • ORGANIC IMPURITIES

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

Solution A: Use *Mobile phase* in the Assay.

Solution B: Buffer and Solution A (50:50)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	0	100
4	0	100
30	55	45
65	55	45
68	0	100
80	0	100

Diluent: Acetonitrile and tetrahydrofuran (3:2)

System suitability stock solution: 0.5 mg/mL of USP Adapalene RS, prepared as follows. Transfer USP Adapalene RS to a suitable volumetric flask, add tetrahydrofuran equivalent to 40% of the final volume, and sonicate to dissolve. Dilute with acetonitrile to volume.

System suitability solution: 0.2 mg/mL of USP Adapalene RS in Diluent, from System suitability stock solution

Standard solution: 1.0 μg/mL of USP Adapalene RS in Diluent, from System suitability solution

Sample solution: Nominally equivalent to 0.2 mg/mL of adapalene, prepared as follows. Transfer 5.0 g of Gel to a 25-mL volumetric flask. Add 10 mL of tetrahydrofuran and sonicate to disperse for 10 min. Add 10 mL of acetonitrile and sonicate for 10 min. Cool to room temperature and dilute with acetonitrile to volume. Pass a portion through a Teflon filter of 0.45-μm pore size and use the filtrate.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 20 μL

#### System suitability

Samples: *System suitability solution* and *Standard solution*

#### Suitability requirements

Tailing factor: NMT 2.0, System suitability solution

Relative standard deviation: NMT 5.0%, Standard solution

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of each impurity from the *Sample solution*

$r_S$  = peak area of adapalene from the *Standard solution*

$C_S$  = concentration of USP Adapalene RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of adapalene in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2. Disregard any peak less than 0.1%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Adapalene related compound A <sup>a,b</sup>	0.5	—
Adapalene	1.0	—
Adapalene related compound B <sup>b,c</sup>	1.3	—
Any unspecified impurity	—	0.2
Total impurities	—	1.0

<sup>a</sup> Methyl 6-bromo-2-naphthoate.

<sup>b</sup> This process impurity is controlled in the drug substance monograph. It is included in the table for identification only and it is not to be reported in the total impurities.

<sup>c</sup> Methyl 6-[3-(adamant-1-yl)-4-methoxyphenyl]-2-naphthoate.

### SPECIFIC TESTS

• **pH (791):** 4.0–6.0

• **MINIMUM FILL (755):** Meets the requirements

• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count is NMT  $10^2$  cfu/g. The total yeasts and molds count is NMT  $10^1$  cfu/g. It meets the requirements of the tests for the absence of *Escherichia coli*, *Salmonella* species, *Staphylococcus aureus*, and *Pseudomonas aeruginosa* species.

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature and protect from freezing.

• **USP REFERENCE STANDARDS (11)**  
 USP Adapalene RS

## Adenine

$C_5H_5N_5$  135.13  
1*H*-Purin-6-amine;  
1,6-Dihydro-6-iminopurine [73-24-5].

### DEFINITION

Adenine contains NLT 98.0% and NMT 102.0% of adenine ( $C_5H_5N_5$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer solution:** Dissolve 6.90 g of monobasic ammonium phosphate in about 800 mL of water. Adjust with ammonium hydroxide to a pH of 6.2, and dilute with water to 1 L.

**Mobile phase:** See Table 1.

Table 1

Time (min)	Buffer Solution (%)	Acetonitrile (%)	Water (%)
0	5	5	90
20	5	5	90
20.1	10	10	80
30	10	10	80
30.1	5	5	90
40	5	5	90

**System suitability solution:** 50 µg/mL each of USP Adenine RS and 7-methyladenine in water

**Standard solution:** 0.1 mg/mL of USP Adenine RS in water. If necessary, sonicate the solution at 30° until the substance is completely dissolved.

**Sample solution:** 0.1 mg/mL of Adenine in water. If necessary, sonicate the solution at 30° until the substance is completely dissolved.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L85

**Flow rate:** 1.0 mL/min

**Injection volume:** 10 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for 7-methyladenine and adenine are 0.88 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between the 7-methyladenine and adenine peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of adenine ( $C_5H_5N_5$ ) in the portion of Adenine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Adenine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Adenine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

### Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 µg/g • (Official 1-

Jan-2018)

### • RELATED COMPOUNDS

**Buffer solution, Mobile phase, System suitability solution, Standard solution, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** Dissolve 25 mg of Adenine in approximately 15 mL of boiling water. Cool, quantitatively transfer to a 25-mL volumetric flask, and dilute with water to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L85

**Flow rate:** 1.0 mL/min

**Injection volume:** 20 µL

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Adenine taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_T$  = sum of all the peak responses from the *Sample solution*

#### Acceptance criteria

**Individual impurity:** NMT 0.1%

**Total impurities:** NMT 2.0%

### SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 110° for 4 h: it loses NMT 1.0% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Adenine RS

## Adenosine

$C_{10}H_{13}N_5O_4$  267.24

6-Amino-9-β-D-ribofuranosyl-9*H*-purine;  
9-β-D-Ribofuranosyladenine [58-61-7].

### DEFINITION

Adenosine contains NLT 98.0% and NMT 102.0% of adenosine ( $C_{10}H_{13}N_5O_4$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197M)
- **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer:** 6.8 g/L of potassium hydrogen sulfate and 3.4 g/L of tetrabutylammonium hydrogen sulfate in a solution prepared as follows. Transfer suitable quantities of potassium hydrogen sulfate and tetrabutyl ammonium hydrogen sulfate to an appropriate volumetric flask, and dissolve in 90% of the flask volume of water. Adjust with 2 N potassium hydroxide to a pH of 6.5, and dilute with water to volume.

**Mobile phase:** Buffer and water (60:40)

**System suitability solution:** 4 µg/mL each of USP Adenine RS and inosine in *Mobile phase*

**Standard solution:** 0.2 mg/mL of USP Adenosine RS in *Mobile phase*

**Sample solution:** 0.2 mg/mL of Adenosine in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

**Run time:** NLT 1.5 times the retention time of the adenosine peak

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between adenine and inosine, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 0.7%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of adenosine (C<sub>10</sub>H<sub>13</sub>N<sub>5</sub>O<sub>4</sub>) in the portion of Adenosine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Adenosine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Adenosine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%

**Delete the following:**

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm • (Official 1-Jan-2018)

• **ORGANIC IMPURITIES**

**Buffer, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 0.001 mg/mL of USP Adenosine RS in *Mobile phase*

**Sample solution:** 1 mg/mL of Adenosine in *Mobile phase*

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between adenine and inosine, *System suitability solution*

**Relative standard deviation:** NMT 5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Adenosine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Adenosine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Adenosine in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 1*)

**Acceptance criteria:** See *Table 1*. Disregard peaks that are less than 0.05% of the adenosine peak.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Uridine <sup>a</sup>	0.29	0.73	0.10
Adenine	0.34	1.6	0.2
Inosine <sup>b</sup>	0.42	0.73	0.1
Guanosine <sup>c</sup>	0.51	0.86	0.10
Adenosine	1.0	—	—
Any individual unspecified impurity	—	1.0	0.10
Total impurities	—	—	0.5

<sup>a</sup> 1-β-D-Ribofuranosylpyrimidine-2,4(1H,3H)-dione.

<sup>b</sup> 9-β-D-Ribofuranosylpurine-6(1H)-one.

<sup>c</sup> 2-Amino-9-β-D-ribofuranosylpurine-6(1H)-one.

**SPECIFIC TESTS**

- **OPTICAL ROTATION**, *Specific Rotation* (781S): −68° to −72°

**Test solution:** 20 mg/mL in sodium hydroxide solution (1 in 20), determined on a sample previously dried at 105° for 2 h

- **LOSS ON DRYING** (731)

**Analysis:** Dry a sample at 105° for 2 h.

**Acceptance criteria:** NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS** (11)

USP Adenine RS

USP Adenosine RS

**Adenosine Injection****DEFINITION**

Adenosine Injection is a sterile solution of Adenosine in Water for Injection. It may contain Sodium Chloride. It contains NLT 90.0% and NMT 110.0% of the labeled amount of adenosine (C<sub>10</sub>H<sub>13</sub>N<sub>5</sub>O<sub>4</sub>).

**IDENTIFICATION**

- The retention time of the adenosine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Mobile phase:** Dissolve 2.0 g of monobasic potassium phosphate in 800 mL of water. Add 5 mL of 1.0 M tetrabutylammonium dihydrogen phosphate, dilute with water to 980 mL, and mix. Add 20 mL of acetonitrile.

**System suitability solution:** 0.03 mg/mL each of USP Adenosine RS and inosine dissolved in warm water (50° to 55°), and diluted with water

**Standard solution:** 0.03 mg/mL of USP Adenosine RS dissolved in warm water (50° to 55°), and diluted with water to volume. Before addition of the warm water, if sodium chloride is present in the injection, add 0.01 mL of a solution of sodium chloride (0.9 in 100) per mL of the anticipated final volume of the *Standard solution*.

**Sample solution:** Nominally 0.03 mg/mL of adenosine, from a suitable volume of injection in water

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 2.5 mL/min

**Injection volume:** 10 µL

**Run time:** 2.5 times the retention time of adenosine

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times of inosine and adenosine are 0.43 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 6.0 between adenosine and inosine, *System suitability solution*

**Tailing factor:** NMT 2.0 for the adenosine peak, *System suitability solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of adenosine ( $C_{10}H_{13}N_5O_4$ ) in the portion of injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Adenosine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of adenosine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**IMPURITIES****• ORGANIC IMPURITIES**

**Mobile phase, System suitability solution, Standard solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** Nominally 0.3 mg/mL of adenosine from a volume of injection, in water

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the volume of injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses of all of the peaks

**Acceptance criteria**

**Any individual impurity:** NMT 1.0%

**Total impurities:** NMT 1.5%

**SPECIFIC TESTS**

**• pH (791):** 4.5–7.5

**• PARTICULATE MATTER IN INJECTIONS (788):** It meets the requirements for small-volume injections.

**• BACTERIAL ENDOTOXINS TEST (85):** When the product is used for rapid intravenous injection, it contains NMT 11.62 USP Endotoxin Units/mg of adenosine. When the product is used for continuous peripheral intravenous infusion, it contains NMT 5.95 USP Endotoxin Units/mg of adenosine.

**• OTHER REQUIREMENTS:** It meets the requirements under *Injections and Implanted Drug Products* (1).

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Preserve in tight, single-dose containers, preferably of Type I glass, and store at controlled room temperature.

**• USP REFERENCE STANDARDS (11)**

USP Adenosine RS

USP Endotoxin RS

**Medical Air****DEFINITION**

Medical Air is a natural or synthetic mixture of gases consisting largely of nitrogen and oxygen. It contains NLT 19.5% and NMT 23.5%, by volume, of oxygen ( $O_2$ ).

**IDENTIFICATION**

- **A.** The paramagnetic signal exhibited by the *Sample gas* in the *Assay* confirms the presence of oxygen.
- **B.** The *Sample gas* in the *Assay* meets the assay *Acceptance criteria*.

**ASSAY****• PROCEDURE**

The certified standards called for in the following test are listed in *Reagents, Indicators, and Solutions*.

**Zero gas:** Nitrogen certified standard

**Span gas:** 21% Oxygen certified standard. [NOTE—See *Reagents, Indicators, and Solutions*.]

**Sample gas:** Medical Air

**Mode:** Paramagnetic oxygen measurement (see *Medical Gases Assay* (415))

**Analysis:** Determine the concentration of oxygen in percentage by volume of Medical Air using a suitable paramagnetic analyzer.

**Acceptance criteria:** 19.5%–23.5% of oxygen by volume

**IMPURITIES**

See *Impurities Testing in Medical Gases Assay* (413). The detector tubes called for in the following tests are listed in *Reagents, Indicators, and Solutions*.

If the label indicates that Medical Air is a synthetic mixture of oxygen and nitrogen, and where oxygen complies to *Oxygen USP* and Nitrogen complies to *Nitrogen NF*, then the *Impurities* tests are not required.

**• LIMIT OF CARBON DIOXIDE**

**Sample:** Detector tube manufacturer's recommended volume  $\pm 5\%$  of Medical Air

**Analysis:** Pass the *Sample* through a carbon dioxide detector tube at the rate specified for the tube by the detector tube manufacturer.

**Acceptance criteria:** NMT 500 ppm

**• LIMIT OF CARBON MONOXIDE**

**Sample:** Detector tube manufacturer's recommended volume  $\pm 5\%$  of Medical Air

**Analysis:** Pass the *Sample* through a carbon monoxide detector tube at the rate specified for the tube by the detector tube manufacturer.

**Acceptance criteria:** NMT 10 ppm

• **LIMIT OF SULFUR DIOXIDE**

**Sample:** Detector tube manufacturer's recommended volume  $\pm 5\%$  of Medical Air

**Analysis:** Pass the *Sample* through a sulfur dioxide detector tube at the rate specified for the tube by the detector tube manufacturer.

**Acceptance criteria:** NMT 5 ppm

• **LIMIT OF NITRIC OXIDE AND NITROGEN DIOXIDE**

**Sample:** Detector tube manufacturer's recommended volume  $\pm 5\%$  of Medical Air

**Analysis:** Pass the *Sample* through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube by the detector tube manufacturer.

**Acceptance criteria:** NMT 2.5 ppm

• **LIMIT OF WATER AND OIL**

**Analysis:** Support one container in an inverted position (with the valve at the bottom) for 5 min. Cautiously open the valve slightly, maintaining the container in an inverted position. Vent the gas with a barely audible flow against a stainless steel mirror for a few seconds.

**Acceptance criteria:** No liquid is discernible on the mirror.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in pressurized containers. Container connections shall be appropriate for air. Adaptors shall not be used to connect containers to patient use supply system piping or equipment.

• **LABELING:** Label states if Medical Air is a synthetic mixture of *Oxygen USP* and *Nitrogen NF*. Where it is piped directly from the collecting tank to the patient point of use, label each outlet "Medical Air".

## Alanine

$C_3H_7NO_2$   
L-Alanine [56-41-7].

89.09

**DEFINITION**

Alanine contains NLT 98.5% and NMT 101.5% of L-alanine ( $C_3H_7NO_2$ ), calculated on the dried basis.

**IDENTIFICATION**

• **A. INFRARED ABSORPTION** (197K)

**ASSAY**

• **PROCEDURE**

**Sample:** 80 mg of Alanine

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Blank:** 3 mL of formic acid in 50 mL of glacial acetic acid

**Analysis:** Dissolve the *Sample* in a mixture of 3 mL of formic acid and 50 mL of glacial acetic acid, and titrate with *Titrant*.

Calculate the percentage of L-alanine ( $C_3H_7NO_2$ ) in the portion of Alanine taken:

$$\text{Result} = [(V_S - V_B) \times N \times F \times 100] / W$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 89.09 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

**IMPURITIES**

• **RESIDUE ON IGNITION** (281): NMT 0.15%

• **CHLORIDE AND SULFATE, Chloride** (221)

**Standard solution:** 0.70 mL of 0.020 N hydrochloric acid

**Sample:** 1.0 g of Alanine

**Acceptance criteria:** NMT 0.05%

• **CHLORIDE AND SULFATE, Sulfate** (221)

**Standard solution:** 0.30 mL of 0.020 N sulfuric acid

**Sample:** 1.0 g of Alanine

**Acceptance criteria:** NMT 0.03%

• **IRON** (241): NMT 30 ppm

**Delete the following:**

• **HEAVY METALS, Method I** (231): NMT 15 ppm • (Official 1-

Jan-2018)

• **RELATED COMPOUNDS**

**Mobile phase:** 0.008 N sulfuric acid solution

**System suitability solution:** A mixture of 0.05 mg/mL of USP Fumaric Acid RS, 0.05 mg/mL of USP Maleic Acid RS, and 3 mg/mL of USP Malic Acid RS in water

**Maleic acid standard solution:** 0.05 mg/mL of USP Maleic Acid RS in water

**Malic acid standard solution:** 3 mg/mL of USP Malic Acid RS in water

**Fumaric acid standard solution:** 0.05 mg/mL of USP Fumaric Acid RS in water

**Sample solution:** 100 mg/mL of Alanine in water

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 7.8-mm  $\times$  30-cm; 9- $\mu$ m packing L17

**Column temperature:** 30°

**Flow rate:** 0.6 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *System suitability solution*

[NOTE—See *Table 1* for the relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between maleic acid and malic acid

**Relative standard deviation:** NMT 5.0% for each of fumaric acid, maleic acid, and malic acid

**Analysis**

**Samples:** Standard solutions and *Sample solution*

Calculate the percentage of each specified acid in the portion of Alanine taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of maleic acid, malic acid, or fumaric acid from the *Sample solution*

$r_S$  = peak response of maleic acid, malic acid, or fumaric acid from the corresponding Standard solution

$C_S$  = concentration of USP Maleic Acid RS, USP Malic Acid RS, or USP Fumaric Acid RS in the corresponding Standard solution (mg/mL)

$C_U$  = concentration of Alanine in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Alanine taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of any unspecified impurity from the *Sample solution*

- $r_s$  = peak response of fumaric acid from the Fumaric acid standard solution  
 $C_s$  = concentration of USP Fumaric Acid RS in the Fumaric acid standard solution (mg/mL)  
 $C_u$  = concentration of Alanine in the Sample solution (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Maleic acid	0.5	0.05
Malic acid	0.6	0.05
Fumaric acid	1.0	0.05
Alanine	Not observed	—
Any unspecified impurity	—	0.05
Total unspecified impurities	—	0.20

### SPECIFIC TESTS

- OPTICAL ROTATION, Specific Rotation (7815)**  
 Sample solution: 100 mg/mL in 6 N hydrochloric acid  
 Acceptance criteria: +13.7° to +15.1°
- PH (791):** 5.5–7.0, in a solution (1 in 20)
- LOSS ON DRYING (731)**  
 Analysis: Dry at 105° for 3 h.  
 Acceptance criteria: NMT 0.2%

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**  
 USP L-Alanine RS  
 USP Fumaric Acid RS  
 USP Maleic Acid RS  
 USP Malic Acid RS

## Albendazole

$C_{12}H_{15}N_3O_2S$  265.33  
 Carbamic acid, [5-(propylthio)-1H-benzimidazol-2-yl]-, methyl ester;  
 Methyl 5-(propylthio)-2-benzimidazolecarbamate [54965-21-8].

### DEFINITION

Albendazole contains NLT 98.0% and NMT 102.0% of albendazole ( $C_{12}H_{15}N_3O_2S$ ), calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION (197M)**
- B.** The  $R_f$  value of the principal spot of the Sample solution corresponds to that of the principal spot of the Standard solution, as obtained in the test for Organic Impurities.

### ASSAY

#### PROCEDURE

Sample: 250 mg of Albendazole  
 Analysis: Transfer the Sample to a suitable flask, and dissolve in 100 mL of glacial acetic acid, warming gen-

tly if necessary. Cool, and titrate with 0.1 N perchloric acid VS to a potentiometric endpoint (see *Titrimetry* (541)). Perform a blank determination. Each mL of 0.1 N perchloric acid is equivalent to 26.53 mg of  $C_{12}H_{15}N_3O_2S$ .

Acceptance criteria: 98.0%–102.0% on the dried basis

### IMPURITIES

- RESIDUE ON IGNITION (281):** NMT 0.2%
- ORGANIC IMPURITIES**  
 Standard stock solution: 5 mg/mL of USP Albendazole RS in glacial acetic acid  
 Standard solution: 0.05 mg/mL of USP Albendazole RS in glacial acetic acid from Standard stock solution  
 Sample solution: 10 mg/mL in glacial acetic acid  
**Chromatographic system**  
 (See *Chromatography* (621), *Thin-Layer Chromatography*.)  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of silica gel mixture  
**Application volume:** 10  $\mu$ L  
**Developing solvent system:** Chloroform, ether, and glacial acetic acid (60:10:10)  
**Analysis:** Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*.  
**Samples:** Standard stock solution, Standard solution, and Sample solution  
 Develop the chromatogram in the Developing solvent system until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the solvent to evaporate from the plate, and examine the plate under short-wavelength UV light.  
 Acceptance criteria: 0.5%; no spot, other than the principal spot of the Sample solution, is larger or more intense than the principal spot of the Standard solution.

### SPECIFIC TESTS

- LOSS ON DRYING (731)**  
 Analysis: Dry at 105° for 4 h.  
 Acceptance criteria: NMT 0.5%

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**  
 USP Albendazole RS

## Albendazole Oral Suspension

### DEFINITION

Albendazole Oral Suspension is Albendazole in an aqueous vehicle. It contains one or more preservatives and dispersing or suspending agents. It contains NLT 90.0% and NMT 110.0% of the labeled amount of albendazole ( $C_{12}H_{15}N_3O_2S$ ).

### IDENTIFICATION

- A. ULTRAVIOLET ABSORPTION (197U)**  
 Sample stock solution: 1 mg/mL of albendazole from a quantity of Suspension, in a mixture of methanol and hydrochloric acid (99:1). Filter the mixture, if necessary, to obtain a clear solution.  
 Sample solution: 0.01 mg/mL of albendazole in 0.1 N sodium hydroxide from Sample stock solution

Acceptance criteria: Meets the requirements

## ASSAY

### PROCEDURE

**Solution A:** Methanol and hydrochloric acid (99:1)

**Solution B:** 13.75 g/L of monobasic sodium phosphate

**Mobile phase:** Methanol and *Solution B* (60:40)

**Standard stock solution:** 1 mg/mL of USP Albendazole RS in *Solution A*

**Standard solution:** 100 µg/mL of USP Albendazole RS from *Standard stock solution* in *Mobile phase*

**Sample stock solution:** Equivalent to 1 mg/mL of albendazole from a volume of Oral Suspension in *Solution A*

**Sample solution:** Nominally 100 µg/mL of albendazole from *Sample stock solution* in *Mobile phase*. [NOTE—Filter, if necessary, to obtain a clear solution.]

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 308 nm

**Column:** 4-mm × 25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20 µL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 2000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of albendazole ( $C_{12}H_{15}N_3O_2S$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Albendazole RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of albendazole in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

## SPECIFIC TESTS

• **PH** <791>: 4.5–5.5

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

• **LABELING:** Label it to indicate that it is for veterinary use only.

• **USP REFERENCE STANDARDS** <11>

USP Albendazole RS

## Albendazole Tablets

» Albendazole Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of albendazole ( $C_{12}H_{15}N_3O_2S$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Tablets intended for veterinary use only are so labeled.

**USP Reference standards** <11>—

USP Albendazole RS

USP Parbendazole RS

## Identification—

**A: Ultraviolet Absorption** <197U>—

**Solution:** Dilute a portion of the clear filtrate used to prepare the *Assay preparation* and a portion of the stock solution used to prepare the *Standard preparation* prepared in the *Assay* with *Acidified methanol*, prepared as directed for *Dissolution*, to obtain solutions containing about 10 µg of albendazole per mL.

**B:** The retention time of the major peak for albendazole in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

## Dissolution

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

Determine the amount of  $C_{12}H_{15}N_3O_2S$  dissolved using the following procedure.

**Acidified methanol**—To about 50 mL of methanol in a 100-mL volumetric flask add 2 mL of hydrochloric acid, dilute with methanol to volume, and mix.

**Standard solution**—Transfer about 90 mg of USP Albendazole RS, accurately weighed, to a 250-mL volumetric flask, add 10 mL of *Acidified methanol*, and shake to dissolve. Dilute with 0.1 N hydrochloric acid to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

**Procedure**—Transfer 10.0 mL of a filtered portion of the solution under test to a 250-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix. Concomitantly determine the absorbances of this solution and the *Standard solution* at the wavelengths of maximum and minimum absorbance at about 308 nm and 350 nm, using 0.1 N sodium hydroxide as the blank. Calculate the quantity, in mg, of  $C_{12}H_{15}N_3O_2S$  dissolved by the formula:

$$22.5C(A_U / A_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Albendazole RS in the *Standard solution*; and  $A_U$  and  $A_S$  are the differences in absorbance between 308 nm and 350 nm obtained from the solution under test and the *Standard solution*, respectively.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{12}H_{15}N_3O_2S$  is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Procedure for content uniformity**—

**Acidified methanol and Standard solution**—Prepare as directed under *Dissolution*.

**Test solution**—Place 1 Tablet in a 500-mL volumetric flask, add about 300 mL of *Acidified methanol*, and shake by mechanical means for about 30 minutes. Dilute with *Acidified methanol* to volume, and mix. Filter a portion of this solution, discarding the first 20 mL of the filtrate. Transfer 4.0 mL of the clear filtrate to a 200-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* at the wavelengths of maximum and minimum absorbance at about 308 nm and 350 nm, using 0.1 N sodium hydroxide as the blank. Calculate the quantity, in mg, of  $C_{12}H_{15}N_3O_2S$  in the Tablet taken by the formula:

$$25C(A_U / A_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Albendazole RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the differences in absorbance between 308 nm and 350 nm obtained from the *Test solution* and the *Standard solution*, respectively.

**Assay—**

**Mobile phase**—Dissolve 0.50 g of monobasic ammonium phosphate in 400 mL of water. Add 600 mL of methanol, mix, and filter, discarding the first 15 mL of the filtrate. Degass the clear filtrate before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Sulfuric acid in methanol**—Prepare a mixture of 1 mL of sulfuric acid and 99 mL of methanol.

**Internal standard solution**—Transfer about 150 mg of USP Parbendazole RS to a 50-mL volumetric flask. Add 5 mL of *Sulfuric acid in methanol*, 25 mL of methanol, and shake to dissolve. Dilute with methanol to volume, and mix.

**Standard preparation**—Transfer about 100 mg of USP Albendazole RS, accurately weighed, to a 50-mL volumetric flask. Add 5 mL of *Sulfuric acid in methanol* and 25 mL of methanol, and shake to dissolve. Dilute with methanol to volume, and mix. Transfer 5.0 mL of this stock solution and 5.0 mL of *Internal standard solution* to a second 50-mL volumetric flask, dilute with methanol to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of albendazole, to a 50-mL volumetric flask. Add 5 mL of *Sulfuric acid in methanol* and 20 mL of methanol, and shake by mechanical means for about 15 minutes. Dilute with methanol to volume, mix, and filter, discarding the first 15 mL of the filtrate. Transfer 5.0 mL of the clear filtrate and 5.0 mL of *Internal standard solution* to a second 50-mL volumetric flask, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; the column efficiency is not less than 1000 theoretical plates; the resolution between the albendazole peak and the parbendazole peak is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—[NOTE—Use peak heights where peak responses are indicated.] Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{12}H_{15}N_3O_2S$  in the portion of Tablets taken by the formula:

$$500C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Albendazole RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the albendazole peak to the parbendazole peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Albumin Human

**DEFINITION**

Albumin Human conforms to the regulations of the federal Food and Drug Administration concerning biologics (640.80 to 640.86) (see *Biologics* (1041)). It is a sterile, nonpyrogenic preparation of serum albumin obtained by fractionating material (source blood, plasma, serum, or placentas) from healthy human donors, the source material being tested for the absence of hepatitis B surface antigen. It is made by a process that yields a product that is safe for intravenous use. NLT 96% of its total protein is albumin. It is a solution containing, in each 100 mL, either 25 g of serum albumin osmotically equivalent to

500 mL of normal human plasma, or 20 g equivalent to 400 mL, or 5 g equivalent to 100 mL, or 4 g equivalent to 80 mL, and contains NLT 93.75% and NMT 106.25% of the labeled amount in the case of the solution containing 4 g in each 100 mL, and NLT 94.0% and NMT 106.0% of the labeled amount in the other cases. It contains no added antimicrobial agent, but may contain sodium acetyltryptophanate with or without sodium caprylate as a stabilizing agent. It has a sodium content of NLT 130 mEq/L and NMT 160 mEq/L. It has a heme content such that the absorbance of a solution, diluted to contain 1% of protein, in a 1-cm holding cell, measured at a wavelength of 403 nm, is NMT 0.25. It meets the requirements of the test for heat stability and for pH.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at the temperature recommended by the manufacturer or indicated on the label.
- **EXPIRATION DATE:** The expiration date is not later than 5 years after issue from manufacturer's cold storage (5°, 3 years) if labeling recommends storage between 2° and 10°; not later than 3 years after issue from manufacturer's cold storage (5°, 3 years) if labeling recommends storage at temperatures not higher than 37°; and not later than 10 years after date of manufacture if in a hermetically sealed metal container and labeling recommends storage between 2° and 10°.
- **LABELING:** Label it to state that it is not to be used if it is turbid and that it is to be used within 4 h after the container is entered. Label it also to state the osmotic equivalent in terms of plasma, the sodium content, and the type of source material (venous plasma, placental plasma, or both) from which it was prepared. Label it also to indicate that additional fluids are needed when the 20-g/100-mL or 25-g/100-mL product is administered to a markedly dehydrated patient.

## Albuterol

$C_{13}H_{21}NO_3$  239.31  
1,3-Benzenedimethanol,  $\alpha$ 1-[(1,1-dimethylethyl)amino]methyl]-4-hydroxy-;  
 $\alpha$ 1-[(tert-Butylamino)methyl]-4-hydroxy-m-xylene- $\alpha,\alpha'$ -diol  
[18559-94-9].

**DEFINITION**

Albuterol contains NLT 98.5% and NMT 101.0% of albuterol ( $C_{13}H_{21}NO_3$ ), calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**
- **B. ULTRAVIOLET ABSORPTION (197U)**  
Sample solution: 80 μg/mL in 0.1 N hydrochloric acid  
Acceptance criteria: Meets the requirements

**ASSAY**

- **PROCEDURE**  
Sample solution: 8 mg/mL of Albuterol in glacial acetic acid  
Analysis: To 50 mL of the *Sample solution* add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 23.93 mg of  $C_{13}H_{21}NO_3$ .  
Acceptance criteria: 98.5%–101.0% on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%

- **ORGANIC IMPURITIES**

**Standard solution:** 0.10 mg/mL of USP Albuterol RS in methanol

**Sample solution:** 20 mg/mL of Albuterol in methanol

**Chromatographic system**  
(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 10  $\mu$ L

**Developing solvent system:** Methyl isobutyl ketone, isopropyl alcohol, ethyl acetate, ammonium hydroxide, and water (50:45:35:3:18)

**Visualization:** Iodine vapor

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in the chapter, applying aliquots of the *Standard solution* and the *Sample solution*. Develop in the *Developing solvent system* until the solvent front has moved three-fourths the length of the plate. Remove the plate from the developing chamber, air-dry, and expose it to iodine vapor.

**Acceptance criteria:** Any spot, other than the principal spot, obtained from the *Sample solution* is not greater in size and intensity than the spot produced by the *Standard solution* (0.5%), and the sum of the impurities is not greater than 2.0%.

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method I** (921): NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Albuterol RS

**Albuterol Tablets****DEFINITION**

Albuterol Tablets contain an amount of albuterol sulfate [(C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub>)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>] equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of albuterol (C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub>).

**IDENTIFICATION**

- **A.** The *R<sub>f</sub>* value of the principal spot of the *Sample solution* corresponds to that of *Standard solution A*, obtained as directed in the *Procedure for Organic Impurities*.
- **B. IDENTIFICATION TESTS—GENERAL, Sulfate** (191)  
**Sample solution:** Shake a quantity of powdered Tablets equivalent to 4 mg of albuterol with 10 mL of water, and filter. Use the filtrate.  
**Acceptance criteria:** Meet the requirements

**ASSAY**

- **PROCEDURE**

**Solution A:** 10 mL/L of glacial acetic acid in water

**Solution B:** 1.13 g of sodium 1-hexanesulfonate in 1200 mL of water. Add 12 mL of glacial acetic acid.

**Diluent:** Methanol and water (40:60)

**Mobile phase:** Methanol and *Solution B* (40:60)

**Standard stock solution:** 0.12 mg/mL of USP Albuterol Sulfate RS, prepared as follows. Transfer USP Albuterol Sulfate RS to a suitable volumetric flask, and add a volume of *Solution A* corresponding to 60% of the flask volume. Sonicate for 5 min, and dilute with methanol to volume.

**Standard solution:** 0.03 mg/mL of USP Albuterol Sulfate RS in *Diluent*, from *Standard stock solution*

**Sample solution:** Nominally 0.025 mg/mL of albuterol, prepared as follows. Transfer a number of whole Tablets, equivalent to 50 mg of albuterol, to a suitable volumetric flask. Add 60% of the flask volume of *Solution A*, shake by mechanical means for 45 min, sonicate for 10 min, allow to cool to room temperature, and dilute with methanol to volume. Pass through a suitable filter of 0.45- $\mu$ m or finer pore size.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 276 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 25  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 800 theoretical plates

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of albuterol (C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub>) in the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times M \times (M_{r1}/M_{r2}) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Albuterol Sulfate RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of albuterol in the *Sample solution* (mg/mL)

*M* = number of moles of albuterol per mole of albuterol sulfate, 2

*M<sub>r1</sub>* = molecular weight of albuterol, 239.31

*M<sub>r2</sub>* = molecular weight of albuterol sulfate, 576.70

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **DISSOLUTION, Procedure for a Pooled Sample** (711)

**Medium:** Water; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Diluent, Mobile phase, and Standard stock solution:**  
Proceed as directed in the *Assay*.

**Standard solution:** 0.03 mg/mL of USP Albuterol Sulfate RS in *Diluent*, from *Standard stock solution*. If necessary, dilute with *Diluent* to a concentration corresponding to the *Sample solution*.

**Sample solution:** Pass a portion of the solution under test through a nylon filter of 0.45- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 276 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 100  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 800 theoretical plates

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of albuterol (C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub>) dissolved by comparing the major peak response from the *Sample solution* to that from the *Standard solution*.

**Acceptance criteria:** NLT 80% (Q) of the labeled amount of albuterol (C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub>) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES**• **ORGANIC IMPURITIES**

**Standard solution A:** 0.580 mg/mL of USP Albuterol Sulfate RS in water, equivalent to 0.483 mg/mL of albuterol

**Standard solution B:** 0.218 mg/mL of USP Albuterol Sulfate RS in water, equivalent to 0.183 mg/mL of albuterol

**Standard solution C:** 0.073 mg/mL of USP Albuterol Sulfate RS in water, equivalent to 0.061 mg/mL of albuterol

**Sample solution:** Place a quantity of finely powdered Tablets, equivalent to 48 mg of albuterol, into a suitable container. Add 60 mL of diluted alcohol (1 in 2), and shake by mechanical means for 30 min. Filter the mixture, and wash the filter with small portions of alcohol, combining this with the filtrate. Evaporate the filtrate to dryness under reduced pressure below 40°. Dissolve the residue as completely as possible in 2 mL of water.

**Chromatographic system**

(See Chromatography (621), Thin-Layer Chromatography.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 10 µL. Apply two successive 5-µL aliquots, allowing the solvent to evaporate between applications.

**Developing solvent system:** Methyl isobutyl ketone, isopropyl alcohol, ethyl acetate, ammonium hydroxide, and water (50:45:35:3:18)

**Spray reagent A:** 3-Methyl-2-benzothiazolinone hydrazone hydrochloride TS

**Spray reagent B:** Ammoniacal potassium ferricyanide TS

**Analysis**

**Samples:** *Standard solution A, Standard solution B, Standard solution C, and Sample solution*

Air-dry the plate. Develop the chromatograms until the solvent front has moved about 17 cm. Spray the plate first with *Spray reagent A*, and then *Spray reagent B*, and finally again with *Spray reagent A*. Examine the plate and estimate the responses of any secondary spots observed in the lane of the *Sample solution* by comparison with those of *Standard solutions A, B, and C*.

**Acceptance criteria**

1. 2.0%; no major secondary spot is greater in size or intensity than the principal spot produced by *Standard solution A*.
2. 0.75%; no other secondary spot is greater in size or intensity than the principal spot produced by *Standard solution B*.
3. 0.25%; no more than two other secondary spots are equal in size or intensity to the principal spot produced by *Standard solution C*.
4. The sum of the intensities of all secondary spots obtained from the *Sample solution* corresponds to NMT 3.5%.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS (11)**  
USP Albuterol Sulfate RS

**Albuterol Extended-Release Tablets****DEFINITION**

Albuterol Extended-Release Tablets contain albuterol sulfate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of albuterol ( $C_{13}H_{21}NO_3$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B. ULTRAVIOLET ABSORPTION (197U)**  
**Standard solution:** 80 µg/mL of albuterol from USP Albuterol Sulfate RS in methanol  
**Sample solution:** 80 µg/mL of albuterol in methanol, prepared as follows. Transfer a suitable number of Tablets to a volumetric flask, and dilute with methanol to volume. Stir for 30 min, and centrifuge.  
**Wavelength range:** 210–350 nm  
**Cell path:** 0.2 cm  
**Acceptance criteria:** The *Sample solution* exhibits maxima and minima only at the same wavelengths as the *Standard solution*.

**ASSAY**• **PROCEDURE**

**Buffer:** 0.65 g/L of sodium 1-octane sulfonate and 21.7 g/L of ammonium acetate in water

**Mobile phase:** Glacial acetic acid, 2-propanol, methanol, and *Buffer* (4:3:1:92)

**Diluent:** 10 mL/L of triethylamine in water

**Standard stock solution:** 0.2 mg/mL of USP Albuterol Sulfate RS in *Diluent*

**Standard solution:** 0.02 mg/mL of USP Albuterol Sulfate RS in *Diluent*, from the *Standard stock solution*.

Transfer an aliquot of the *Standard stock solution* to a suitable volumetric flask, and add 4% of the flask volume of methanol. Allow to cool to room temperature, and dilute with *Diluent* to volume.

**Sample solution:** Nominally 0.016 mg/mL of albuterol, prepared as follows. Transfer Tablets (NLT 10) to a suitable volumetric flask, add 10% of the flask volume of methanol, and sonicate for 30 min with regular swirling. Add 60% of the flask volume of *Diluent*, and sonicate for 30 min with swirling. Stir for 60 min, allow the solution to cool to room temperature, and dilute with *Diluent* to volume. Centrifuge a portion of this solution at 2500 rpm for 15 min. Transfer 10 mL of the supernatant into a 50-mL volumetric flask, add 1 mL of methanol, cool to room temperature, and dilute with *Diluent* to volume. Pass the solution through a 1-µm glass fiber or equivalent filter, and discard the first 3 mL of the filtrate.

**Chromatographic system**

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 276 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 40 μL

System suitability

Sample: Standard solution

Suitability requirements

Column efficiency: NLT 2000 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of albuterol ( $C_{13}H_{21}NO_3$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M \times M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Albuterol Sulfate RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of albuterol in the Sample solution (mg/mL)

$M$  = moles of albuterol per mole of albuterol sulfate, 2

$M_{r1}$  = molecular weight of albuterol, 239.31

$M_{r2}$  = molecular weight of albuterol sulfate, 576.70

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm, with helix sinker

Time: 1, 2, 4, and 9 h

Buffer, Mobile phase, Chromatographic system, and

System suitability: Proceed as directed in the Assay, except to use an Injection volume of 50 μL.

Standard stock solution: 0.2 mg/mL of albuterol, using USP Albuterol Sulfate RS, in Medium

Standard solution: Dilute the Standard stock solution with Medium to obtain a final concentration of (L/1000) mg/mL of albuterol, where L is the label claim in mg/Tablet of albuterol.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Analysis

Samples: Standard solution and Sample solution

Calculate the concentration ( $C_i$ ) of albuterol ( $C_{13}H_{21}NO_3$ ) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of albuterol in the Standard solution (mg/mL)

Calculate the percentage of the labeled amount of albuterol ( $C_{13}H_{21}NO_3$ ) released at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + [C_1 \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times (V - (2 \times V_3))] + [(C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times (V - (3 \times V_3))] + [(C_3 + C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$C_i$  = concentration of albuterol in the portion of sample withdrawn at time point i (mg/mL)

$V$  = volume of the Medium (900 mL)

$L$  = label claim (mg/Tablet)

$V_3$  = volume of the Sample solution withdrawn from the Medium (mL)

Tolerances: See Table 1.

Table 1

Time point (i)	Time (h)	Amount released (%)
1	1	25–45
2	2	45–65
3	4	65–85
4	9	NLT 80

The cumulative percentages of the labeled amount of albuterol ( $C_{13}H_{21}NO_3$ ), released at the times specified, conform to Acceptance Table 2 in Dissolution (711).

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### • ORGANIC IMPURITIES, PROCEDURE 1

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with hydrochloric acid to a pH of 3.0.

Mobile phase: Methanol and Buffer (5:95)

System suitability solution: 2 μg/mL each of USP Albuterol Sulfate RS and USP Albuterol Related Compound B RS in Mobile phase

Standard solution: 2.4 μg/mL of USP Albuterol Sulfate RS, 0.80 μg/mL of USP Levalbuterol Related Compound C RS, and 0.25 μg/mL of USP Levalbuterol Related Compound D RS (equivalent to 0.20 μg/mL free base) in Mobile phase

Sensitivity solution: 0.06 μg/mL of USP Albuterol Sulfate RS in Mobile phase

Sample solution: Transfer an amount of powder from NLT 20 Tablets to a suitable volumetric flask to obtain a solution with a final nominal concentration of 0.2 mg/mL of albuterol. Add 70% of the flask volume of Mobile phase, and sonicate for 10 min. Stir for 30 min, and dilute with Mobile phase to volume. Pass the solution through a 1-μm glass fiber or equivalent filter, and discard the first 3 mL of the filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; 5-μm packing L11

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 80 μL

Run time: 5 times the retention time of albuterol

System suitability

Samples: System suitability solution and Standard solution

[NOTE—Identify the impurities using the relative retention times shown in Table 2.]

Suitability requirements:

Tailing factor: NMT 2.0 for each compound, Standard solution

Resolution: NLT 2 between albuterol and albuterol related compound B, System suitability solution

Relative standard deviation: NMT 10.0% for each compound, Standard solution

Analysis

Samples: Standard solution, Sensitivity solution, and Sample solution

[NOTE—Identify the impurities using the relative retention times shown in Table 2.]

Calculate the percentage of levalbuterol related compound C in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of levalbuterol related compound C from the *Sample solution*  
 $r_S$  = peak response of levalbuterol related compound C from the *Standard solution*  
 $C_S$  = concentration of USP Levalbuterol Related Compound C RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of albuterol in the *Sample solution* (mg/mL)

Calculate the percentage of levalbuterol related compound D in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of levalbuterol related compound D from the *Sample solution*  
 $r_S$  = peak response of the levalbuterol related compound D from the *Standard solution*  
 $C_S$  = concentration of USP Levalbuterol Related Compound D RS (as the free base) in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of albuterol in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M \times M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of the impurity from the *Sample solution*  
 $r_S$  = peak response of albuterol from the *Standard solution*  
 $C_S$  = concentration of USP Albuterol Sulfate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of albuterol in the *Sample solution* (mg/mL)  
 $M$  = moles of albuterol per mole of albuterol sulfate, 2  
 $M_{r1}$  = molecular weight of albuterol, 239.31  
 $M_{r2}$  = molecular weight of albuterol sulfate, 576.70

**Acceptance criteria:** See Table 2. Disregard peaks eluting after levalbuterol related compound C or with areas less than that of the *Sensitivity solution*.

Table 2

#### • ORGANIC IMPURITIES, PROCEDURE 2

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with hydrochloric acid to a pH of 3.0.

**Mobile phase:** Methanol and *Buffer* (30:70)

**Diluent:** Methanol and *Buffer* (5:95)

**Peak identification solution:** 2.4 µg/mL of USP Albuterol Sulfate RS, 1.0 µg/mL of USP Levalbuterol Related Compound C RS, and 1.2 µg/mL of USP Levalbuterol Related Compound D RS in *Diluent*

**Standard solution:** 2.4 µg/mL of USP Albuterol Sulfate RS and 1.0 µg/mL of USP Albuterol Related Compound E RS in *Diluent*

**Sensitivity solution:** 0.06 µg/mL of USP Albuterol Sulfate RS in *Diluent* from *Standard solution*

**Sample solution:** Transfer an amount of powder from NLT 20 Tablets to a suitable volumetric flask to obtain a solution with a final concentration of 0.2 mg/mL of albuterol. Add 70% of the flask volume of *Diluent*, and sonicate for 10 min. Stir for 30 min, and dilute with *Diluent* to volume. Pass the solution through a glass fiber or equivalent filter of 1-µm pore size, and discard the first 3 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 225 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L11

**Flow rate:** 0.7 mL/min

**Injection volume:** 80 µL

**Run time:** 5 times the retention time of albuterol

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for each compound

**Relative standard deviation:** NMT 10.0% for each compound

#### Analysis

**Samples:** *Standard solution*, *Peak identification solution*, *Sensitivity solution*, and *Sample solution*

Calculate the percentage of albuterol related compound E in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of albuterol related compound E from the *Sample solution*  
 $r_S$  = peak response of albuterol related compound E from the *Standard solution*

$C_S$  = concentration of USP Albuterol Related Compound E RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of albuterol in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M \times M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of the impurity from the *Sample solution*

$r_S$  = peak response of albuterol from the *Standard solution*

$C_S$  = concentration of USP Albuterol Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of albuterol in the *Sample solution* (mg/mL)

$M$  = moles of albuterol per mole of albuterol sulfate, 2

$M_{r1}$  = molecular weight of albuterol, 239.31

$M_{r2}$  = molecular weight of albuterol sulfate, 576.70

**Acceptance criteria:** See Table 3. Disregard the levalbuterol related compound C peak and any peak eluting before it. Disregard peaks with areas less than that of the *Sensitivity solution*.

Table 3

Compound	Relative Retention Time	Acceptance Criteria, NMT (%)
Albuterol	1.0	—
Levalbuterol related compound C	1.79	—
Levalbuterol related compound D	1.83	—
Albuterol related compound E <sup>a</sup>	3.67	0.5
Any other individual unspecified impurity	—	0.2
Total impurities	—	1.5 <sup>b</sup>

<sup>a</sup> 2,2'-Oxybis(methylene)bis[4-[2-(*tert*-butylamino)-1-hydroxyethyl]phenol].

<sup>b</sup> From the sum of the impurities in Procedure 1 and Procedure 2.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.

#### • USP REFERENCE STANDARDS (11)

USP Albuterol Sulfate RS

USP Albuterol Related Compound B RS

2-(*tert*-Butylamino)-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanone.

$C_{13}H_{19}NO_3$  237.29

USP Albuterol Related Compound E RS

2,2'-Oxybis(methylene)bis[4-[2-(*tert*-butylamino)-1-hydroxyethyl]phenol].

$C_{26}H_{40}N_2O_5$  460.61

USP Levalbuterol Related Compound C RS

$\alpha$ -[[(1,1-Dimethylethyl)amino]methyl]-4-hydroxy-3-(methoxymethyl)-benzenemethanol.

$C_{14}H_{23}NO_3$  253.34

USP Levalbuterol Related Compound D RS

5-[2-[(1,1-Dimethylethyl)amino]-1-hydroxyethyl]-2-hydroxy-benzaldehyde sulfate salt.

$(C_{13}H_{19}NO_3)_2 \cdot H_2SO_4$  572.67

### Albuterol Sulfate

$(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$  576.70

1,3-Benzenedimethanol,  $\alpha$ '-[[[(1,1-dimethylethyl)amino]methyl]-4-hydroxy-, sulfate (2:1) (salt).

$\alpha$ '-[[[(*tert*-Butylamino)methyl]-4-hydroxy-*m*-xylene- $\alpha, \alpha'$ -diol sulfate (2:1) (salt) [51022-70-9].

» Albuterol Sulfate contains not less than 98.5 percent and not more than 101.0 percent of  $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

#### USP Reference standards (11)—

USP Albuterol Related Compound A RS

4-[2-[(1,1-Dimethylethyl)amino]-1-hydroxyethyl]-2-methylphenol sulfate.

USP Albuterol Sulfate RS

#### Identification—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

*Solution:* 80  $\mu$ g per mL.

*Medium:* 0.1 N hydrochloric acid.

**C:** Shake a quantity of it, equivalent to 4 mg of albuterol, with 10 mL of water, and filter: the filtrate so obtained meets the requirements of the tests for *Sulfate* (191).

**D:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water Determination, Method I** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—It meets the requirements of the test for *Organic Impurities* under *Albuterol*, except to read Albuterol Sulfate in place of Albuterol and to use water instead of methanol as the solvent to prepare the *Standard solution* and the *Sample solution*.

#### Assay—

**0.05  $\pm$  0.01 M Ammonium acetate solution**—Dissolve 3.85 g of ammonium acetate in 1000 mL of water, and mix.

**Mobile phase**—Prepare a degassed mixture of water, 0.05  $\pm$  0.01 M Ammonium acetate solution, and isopropanol [65:30: (5  $\pm$  1)], and adjust dropwise with acetic acid to a pH of 4.5  $\pm$  0.3.

**Resolution solution**—Dissolve accurately weighed quantities of USP Albuterol Sulfate RS and USP Albuterol Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.140 mg per mL and 0.030 mg per mL, respectively.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Albuterol Sulfate RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 0.6 mg per mL.

**Assay preparation**—Transfer about 60 mg of Albuterol Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm  $\times$  20-cm column that contains packing L10. The flow rate is about 2.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between albuterol and albuterol related compound A is not less than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$  in the portion of Albuterol Sulfate taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Albuterol Sulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Alclometasone Dipropionate

$C_{28}H_{37}ClO_7$  521.04  
Pregna-1,4-diene-3,20-dione, 7-chloro-11-hydroxy-16-methyl-17,21-bis(1-oxopropoxy)-, (7 $\alpha$ ,11 $\beta$ ,16 $\alpha$ )-; 7 $\alpha$ -Chloro-11 $\beta$ ,17,21-trihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropionate [66734-13-2].

### DEFINITION

Alclometasone Dipropionate contains NLT 97.0% and NMT 102.0% of  $C_{28}H_{37}ClO_7$ , calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197M)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the *Internal standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Solution A:** 6.80 mg/mL of monobasic potassium phosphate (0.05 M)

**Mobile phase:** Methanol and *Solution A* (2:1)

**Internal standard solution:** 2 mg/mL of betamethasone dipropionate in methanol

**Standard stock solution:** 1.2 mg/mL of USP Alclometasone Dipropionate RS in methanol

**Standard solution:** 4.0 mL of *Standard stock solution* and 4.0 mL of *Internal standard solution*. Dilute with methanol to 25 mL. [NOTE—This solution contains approximately 0.2 mg/mL of USP Alclometasone Dipropionate RS.]

**Sample stock solution:** 1.2 mg/mL of Alclometasone Dipropionate in methanol

**Sample solution:** 4 mL of *Sample stock solution* and 4 mL of *Internal standard solution*. Dilute with methanol to 25 mL.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for alclometasone dipropionate and betamethasone dipropionate are about 0.7 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 3.0 between the analyte and the internal standard peaks

**Relative standard deviation:** NMT 2%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{28}H_{37}ClO_7$  in the portion of Alclometasone Dipropionate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak height ratio from the *Sample solution*

$R_S$  = peak height ratio from the *Standard solution*

$C_S$  = concentration of USP Alclometasone Dipropionate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

- RESIDUE ON IGNITION** (281): NMT 0.1%

#### Delete the following:

- HEAVY METALS, Method II** (231): NMT 30 ppm (Official 1.

Jan-2018)

#### Organic Impurities

##### PROCEDURE

**Mobile phase:** Acetonitrile and water (3:2)

**Diluent:** Acetonitrile and water (2:1)

**System suitability solution:** 1.5 mg/mL of USP Alclometasone Dipropionate RS and 0.015 mg/mL of USP Alclometasone Dipropionate Related Compound A RS in *Diluent*

**Sample solution:** 1.5 mg/mL of Alclometasone Dipropionate in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection size:** 5  $\mu$ L

**Run time:** Three times the retention time of alclometasone

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5 for alclometasone dipropionate

**Relative standard deviation:** NMT 2.0% for alclometasone dipropionate

**Resolution:** NLT 2.0 between alclometasone dipropionate and alclometasone dipropionate related compound A

### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Alclometasone Dipropionate taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

$r_U$  = peak area for each impurity from the *Sample solution*

$r_T$  = sum of all the peaks from the *Sample solution*

*F* = relative response factor (see *Impurity Table 1*)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 2.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Alclometasone dipropionate	1.0	—	—
Alclometasone dipropionate related compound A <sup>a</sup>	1.2	0.93	1.0
2-Bromo alclometasone dipropionate <sup>b</sup>	1.7	0.91	0.5
Any individual, unspecified impurity	—	1.0	0.10

<sup>a</sup> 11 $\beta$ ,17,21-Trihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropionate.

<sup>b</sup> 2-Bromo-7 $\alpha$ -chloro-11 $\beta$ ,17,21-trihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropionate.

### SPECIFIC TESTS

- OPTICAL ROTATION, Specific Rotation (781S)**  
Sample solution: 30 mg/mL in dioxane  
Acceptance criteria: +21° to +25°
- LOSS ON DRYING (731):** Dry a sample in a vacuum at a pressure not exceeding 5 mm of mercury at 105° for 3 h; it loses NMT 0.5% of its weight.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**  
USP Alclometasone Dipropionate RS  
USP Alclometasone Dipropionate Related Compound A RS  
11 $\beta$ ,17,21-Trihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropionate.  
C28H38O7 486.60

## Alclometasone Dipropionate Cream

### DEFINITION

Alclometasone Dipropionate Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of alclometasone dipropionate (C28H37ClO7) in a suitable cream base.

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the *Assay*.
- B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**  
**Standard solution:** 0.08 mg/mL of USP Alclometasone Dipropionate RS in methanol  
**Sample solution:** Place a quantity of Cream, equivalent to 1.25 mg of alclometasone dipropionate, in a 50-mL centrifuge tube, and add 15 mL of methanol. Insert a stopper securely into the tube, and place the tube in a water bath maintained at 60° until the semisolid components melt. Remove the tube from the bath, shake vigorously until the specimen components resolidify, and place the tube in an ice-methanol bath for 15 min. Remove the tube from the bath, and centrifuge at 2500 rpm for 5 min. Transfer the clear supernatant to a vial, and allow to equilibrate to room temperature.

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 20  $\mu$ L

**Developing solvent system:** Chloroform and acetone (7:1)

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Dry the applications with the aid of a stream of nitrogen, and develop the chromatograms in a saturated, unlined chromatographic chamber. When the solvent front has moved three-fourths of the length of the plate, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Observe the plate under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot obtained from the *Sample solution* corresponds to that of the *Standard solution*.

### ASSAY

#### PROCEDURE

**Buffer:** 6.80 g/L of monobasic potassium phosphate (0.05 M)

**Mobile phase:** Methanol and *Buffer* (2:1)

**Internal standard solution:** 0.4 mg/mL of betamethasone dipropionate in methanol

**Standard stock solution:** 0.25 mg/mL of USP Alclometasone Dipropionate RS in methanol

**Standard solution:** 0.08 mg/mL of USP Alclometasone Dipropionate RS obtained by combining, in a small stoppered flask, 5.0 mL of *Standard stock solution*, 5.0 mL of methanol, and 5.0 mL of *Internal standard solution*

**Sample solution:** Transfer a quantity of Cream, equivalent to 1.25 mg of alclometasone dipropionate, to a 50-mL centrifuge tube. Add 5.0 mL of *Internal standard solution* and 10.0 mL of methanol. Insert a stopper securely into the tube, and place it in a water bath maintained at 60° until the semisolid components melt. Remove the tube from the bath, shake vigorously until the specimen components resolidify, and return the tube to the 60° water bath until the semisolid components melt. Remove the tube from the bath, shake vigorously until the specimen components resolidify, and place the tube in an ice-methanol bath for 15 min. Remove the tube from the bath, and centrifuge at 2500 rpm for 5 min. Transfer the clear supernatant to a small stoppered flask, and allow to equilibrate to room temperature.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for alclometasone dipropionate and betamethasone dipropionate are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between the analyte and internal standard peaks

**Relative standard deviation:** NMT 2%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alclometasone dipropionate (C28H37ClO7) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak height ratio of alclometasone dipropionate to the internal standard from the *Sample solution*

$R_S$  = peak height ratio of alclometasone dipropionate to the internal standard from the *Standard solution*

- $C_s$  = concentration of USP Alclometasone Dipropionate RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of alclometasone dipropionate in the *Sample solution* (mg/mL)  
 Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL (755):** Meets the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** Meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Alclometasone Dipropionate RS

## Alclometasone Dipropionate Ointment

**DEFINITION**

Alclometasone Dipropionate Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of alclometasone dipropionate ( $C_{28}H_{37}ClO_7$ ) in a suitable ointment base.

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the *Assay*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Standard solution:** 0.25 mg/mL USP Alclometasone Dipropionate RS in methanol

**Sample solution:** Place a quantity of Ointment, equivalent to 1.25 mg of alclometasone dipropionate, in a 50-mL centrifuge tube, add 10 mL of 2,2,4-trimethylpentane, insert a stopper securely into the tube, and disperse the specimen using a vortex mixer. Add 5.0 mL of a solution of methanol in water (45 in 50), insert the stopper securely, shake vigorously for 2 min, and centrifuge at 2500 rpm for 3 min. Remove the lower, aqueous alcohol phase, and transfer to a stoppered vial.

**Chromatographic system**  
(See *Chromatography (621)*, *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 20  $\mu$ L

**Developing solvent system:** Chloroform and acetone (7:1)

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Dry the applications with the aid of a stream of nitrogen, and develop the chromatograms in a saturated, unlined chromatographic chamber. When the solvent front has moved three-fourths of the length of the plate, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Observe the plate under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot obtained from the *Sample solution* corresponds to that of the *Standard solution*.

**ASSAY**• **PROCEDURE**

**Buffer:** 6.80 g/L of monobasic potassium phosphate (0.05 M)

**Solution A:** Dilute 450 mL of methanol with water to 500 mL.

**Mobile phase:** Methanol and *Buffer* (2:1)

**Internal standard solution:** 0.15 mg/mL of

betamethasone dipropionate in *Solution A*

**Standard stock solution:** 0.1 mg/mL of USP Alclometasone Dipropionate RS in *Solution A*

**Standard solution:** 0.05 mg/mL of USP Alclometasone

Dipropionate RS obtained by combining, in a small stoppered flask, 5.0 mL of *Standard stock solution* and 5.0 mL of *Internal standard solution*

**Sample solution:** Transfer a quantity of Ointment, equivalent to 0.5 mg of alclometasone dipropionate, to a 50-mL centrifuge tube, add 10 mL of 2,2,4-trimethylpentane, insert a stopper securely into the tube, and disperse the specimen using a vortex mixer. Add 5.0 mL of *Internal standard solution* and 5.0 mL of *Solution A*, insert the stopper securely, shake vigorously for 2 min, and centrifuge at 2500 rpm for 3 min. Remove the lower, aqueous alcohol phase, and transfer this *Sample solution* to a stoppered vial.

**Chromatographic system**

(See *Chromatography (621)*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for alclometasone dipropionate and betamethasone dipropionate are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.0 between the analyte and internal standard peaks

**Relative standard deviation:** NMT 2%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alclometasone dipropionate ( $C_{28}H_{37}ClO_7$ ) in the portion of Ointment taken:

$$\text{Result} = (R_u/R_s) \times (C_s/C_u) \times 100$$

$R_u$  = peak height ratio of alclometasone dipropionate to the internal standard from the *Sample solution*

$R_s$  = peak height ratio of alclometasone dipropionate to the internal standard from the *Standard solution*

$C_s$  = concentration of USP Alclometasone Dipropionate RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of alclometasone dipropionate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL (755):** Meets the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** Meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Alclometasone Dipropionate RS

**Alcohol**

Portions of this monograph that are national USP text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

$\text{C}_2\text{H}_6\text{O}$  46.07  
Ethanol;  
Ethyl alcohol [64-17-5].

**DEFINITION**

♦Alcohol contains NLT 92.3% and NMT 93.8%, by weight, corresponding to NLT 94.9% and NMT 96.0%, by volume, at 15.56°, of  $\text{C}_2\text{H}_5\text{OH}$ .♦

**IDENTIFICATION**

- **A.** It meets the requirements of the test for *Specific Gravity* (841).
- **B. INFRARED ABSORPTION** (197F) or (197S): Neat

**IMPURITIES**• **LIMIT OF NONVOLATILE RESIDUE**

Sample: 100 mL of Alcohol

Analysis: Evaporate the Sample in a tared dish on a water bath, and dry at 100°–105° for 1 h.

Acceptance criteria: The weight of the residue is NMT 2.5 mg.

• **ORGANIC IMPURITIES**

Sample solution A: Alcohol (substance under test)

Sample solution B: 300 µL/L of 4-methylpentan-2-ol in Sample solution A

Standard solution A: 200 µL/L of methanol in Sample solution A

Standard solution B: 10 µL/L of methanol and 10 µL/L of acetaldehyde in Sample solution A

Standard solution C: 30 µL/L of acetal in Sample solution A

Standard solution D: 2 µL/L of benzene in Sample solution A

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary; bonded with a 1.8-µm layer of phase G43

Split ratio: 20:1

Temperatures

Injection port: 200°

Detector: 280°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	12
40	10	240	10

Linear velocity: 35 cm/s

Carrier gas: Helium

Injection volume: 1.0 µL

**System suitability**

Sample: Standard solution B

**Suitability requirements**

Resolution: NLT 1.5 between the first major peak (acetaldehyde) and the second major peak (methanol)

**Analysis**

Samples: Sample solution A, Sample solution B, Standard solution A, Standard solution B, Standard solution C, and Standard solution D

**Methanol calculation**

$$\text{Result} = (r_U/r_S)$$

$r_U$  = peak area of methanol from Sample solution A

$r_S$  = peak area of methanol from Standard solution A

**Acetaldehyde calculation** (sum of acetaldehyde and acetal)

$$\text{Result} = \{[A_E/(A_T - A_E)] \times C_A\} + \{[D_E/(D_T - D_E)] \times C_D \times (M_{r1}/M_{r2})\}$$

$A_E$  = peak area of acetaldehyde from Sample solution A

$A_T$  = peak area of acetaldehyde from Standard solution B

$C_A$  = concentration of acetaldehyde in Standard solution B (µL/L)

$D_E$  = peak area of acetal from Sample solution A

$D_T$  = peak area of acetal from Standard solution C

$C_D$  = concentration of acetal in Standard solution C (µL/L)

$M_{r1}$  = molecular weight of acetaldehyde, 44.05

$M_{r2}$  = molecular weight of acetal, 118.2

**Benzene calculation**

$$\text{Result} = [B_E/(B_T - B_E)] \times C_B$$

$B_E$  = peak area of benzene from Sample solution A

$B_T$  = peak area of benzene from Standard solution D

$C_B$  = concentration of benzene in Standard solution D (µL/L)

[NOTE—If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).]

**Any other impurity calculation**

$$\text{Result} = (r_U/r_M) \times C_M$$

$r_U$  = peak area of each impurity in Sample solution B

$r_M$  = peak area of 4-methylpentan-2-ol in Sample solution B

$C_M$  = concentration of 4-methylpentan-2-ol in Sample solution B (µL/L)

Acceptance criteria: See Table 2.

Table 2

Name	Acceptance Criteria
Methanol	NMT 0.5, corresponding to 200 µL/L
Acetaldehyde and acetal	NMT 10 µL/L, expressed as acetaldehyde

♦ Disregard any peaks of less than 9 µL/L (0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with Sample solution B).

Table 2 (Continued)

Name	Acceptance Criteria
Benzene	NMT 2 $\mu\text{L/L}$
Sum of all other impurities <sup>a</sup>	NMT 300 $\mu\text{L/L}$

<sup>a</sup> Disregard any peaks of less than 9  $\mu\text{L/L}$  (0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with *Sample solution B*).

**SPECIFIC TESTS**

- **\*SPECIFIC GRAVITY (841):** 0.812–0.816 at 15.56°, indicating 92.3%–93.8%, by weight, or 94.9%–96.0%, by volume, of  $\text{C}_2\text{H}_5\text{OH}$ .

- **ULTRAVIOLET ABSORPTION**

Analytical wavelength: 235–340 nm

Cell: 5 cm

Reference: Water

Acceptance criteria

Absorbance: NMT 0.40 at 240 nm; NMT 0.30 between 250 nm and 260 nm; NMT 0.10 between 270 nm and 340 nm

Curve: The spectrum shows a steadily descending curve with no observable peaks or shoulders.

- **\*CLARITY OF SOLUTION**

[NOTE—The *Sample solution* is to be compared to *Standard suspension A* and to water in diffused daylight 5 min after preparation of *Standard suspension A*.]

**Hydrazine solution:** 10 mg/mL of hydrazine sulfate in water. Allow to stand for 4–6 h.

**Methenamine solution:** Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

**Primary opalescent suspension:** Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

**Opalescence standard:** Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. This suspension should not be used beyond 24 h after preparation.

**Standard suspension A:** *Opalescence standard* and water (1 in 20)

**Standard suspension B:** *Opalescence standard* and water (1 in 10)

**Sample solution A:** Substance to be examined

**Sample solution B:** Dilute 1.0 mL of *Sample solution A* with water to 20 mL, and allow to stand for 5 min before testing.

**Blank:** Water

**Analysis:** Transfer a sufficient portion of *Sample solution A* and *Sample solution B* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard suspension A*, *Standard suspension B*, and *Blank* to separate matching test tubes. Compare *Sample solution A*, *Sample solution B*, *Standard suspension A*, *Standard suspension B*, and *Blank* in diffused daylight, viewing vertically against a black background (see *Nephelometry, Turbidimetry, and Visual Comparison* (855), *Visual Comparison*). The diffusion of light must be such that *Standard suspension A* can readily be distinguished from water, and *Standard suspension B* can readily be distinguished from *Standard suspension A*.

**Acceptance criteria:** *Sample solution A* and *Sample solution B* show the same clarity as that of water or their opalescence is not more pronounced than that of *Standard suspension A*.

**ACIDITY OR ALKALINITY**

**Phenolphthalein solution:** Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL.

**Sample:** 20 mL of Alcohol

**Analysis:** To the *Sample* add 20 mL of freshly boiled and cooled water and 0.1 mL of *Phenolphthalein solution*. The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide.

**Acceptance criteria:** The solution is pink (30  $\mu\text{L/L}$ , expressed as acetic acid).

- **\*COLOR OF SOLUTION**

**Standard stock solution:** Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g/L).

**Standard solution:** Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with dilute hydrochloric acid (10 g/L). Prepare the *Standard solution* immediately before use.

**Sample solution:** Substance to be examined

**Blank:** Water

**Analysis:** Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of the *Standard solution* and *Blank* to separate, matching test tubes. Compare the *Sample solution*, *Standard solution*, and *Blank* in diffused daylight, viewing vertically against a white background (see *Nephelometry, Turbidimetry, and Visual Comparison* (855), *Visual Comparison*).

**Acceptance criteria:** The *Sample solution* has the appearance of water or is not more intensely colored than the *Standard solution*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.

- **USP REFERENCE STANDARDS (11)**  
USP Alcohol RS

**Dehydrated Alcohol**

Portions of this monograph that are national USP text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

$\text{C}_2\text{H}_6\text{O}$

Ethanol;

Ethyl alcohol [64-17-5].

46.07

**DEFINITION**

- ♦ Dehydrated Alcohol contains NLT 99.2% by weight, corresponding to NLT 99.5% by volume, at 15.56°, of  $\text{C}_2\text{H}_5\text{OH}$ .

**IDENTIFICATION**

- **A.** It meets the requirements of the test for *Specific Gravity* (841).
- **B. INFRARED ABSORPTION (197S) or (197F):** Neat

**IMPURITIES**

- **LIMIT OF NONVOLATILE RESIDUE**

**Sample:** 100 mL of Dehydrated Alcohol

**Standard solution D:** 2  $\mu\text{L/L}$  of benzene in *Sample solution A*

## **Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm  $\times$  30-m fused-silica capillary; bonded with a 1.8- $\mu\text{m}$  layer of phase G43

**Split ratio:** 20:1

**Temperatures**

**Injection port:** 200°

**Detector:** 280°

**Column:** See *Table 1*.

**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	12
40	10	240	10

**Flow rate:** 35 cm/s

**Carrier gas:** Helium

**Injection volume:** 1.0  $\mu\text{L}$

## **System suitability**

**Sample:** *Standard solution B*

**Suitability requirements**

**Resolution:** NLT 1.5 between the first major peak (acetaldehyde) and the second major peak (methanol)

## **Analysis**

**Samples:** *Sample solution A*, *Sample solution B*, *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Standard solution D*

**Methanol calculation**

$$\text{Result} = r_U/r_S$$

$r_U$  = peak area of methanol from *Sample solution A*

$r_S$  = peak area of methanol from *Standard solution A*

**Acetaldehyde calculation** (sum of acetaldehyde and acetal)

$$\text{Result} = \{[A_E/(A_T - A_E)] \times C_A\} + \{[D_E/(D_T - D_E)] \times C_D \times (M_{r1}/M_{r2})\}$$

$A_E$  = peak area of acetaldehyde from *Sample solution A*

$A_T$  = peak area of acetaldehyde from *Standard solution B*

$C_A$  = concentration of acetaldehyde in *Standard solution B* ( $\mu\text{L/L}$ )

$D_E$  = peak area of acetal from *Sample solution A*

$D_T$  = peak area of acetal from *Standard solution C*

$C_D$  = concentration of acetal in *Standard solution C* ( $\mu\text{L/L}$ )

$M_{r1}$  = molecular weight of acetaldehyde, 44.05

$M_{r2}$  = molecular weight of acetal, 118.2

**Benzene calculation**

$$\text{Result} = [B_E/(B_T - B_E)] \times C_B$$

$B_E$  = peak area of benzene from *Sample solution A*

$B_T$  = peak area of benzene from *Standard solution D*

$C_B$  = concentration of benzene in *Standard solution D* ( $\mu\text{L/L}$ )

[NOTE—If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).]

**Any other impurity calculation**

$$\text{Result} = (r_U/r_M) \times C_M$$

$r_U$  = peak area of each impurity from *Sample solution B*

$r_M$  = peak area of 4-methylpentan-2-ol from *Sample solution B*

$C_M$  = concentration of 4-methylpentan-2-ol in *Sample solution B* ( $\mu\text{L/L}$ )

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Acceptance Criteria
Methanol	NMT 0.5, corresponding to 200 $\mu\text{L/L}$
Acetaldehyde and acetal	NMT 10 $\mu\text{L/L}$ , expressed as acetaldehyde
Benzene	NMT 2 $\mu\text{L/L}$
Sum of all other impurities <sup>a</sup>	NMT 300 $\mu\text{L/L}$

<sup>a</sup> Disregard any peaks of less than 9  $\mu\text{L/L}$  (0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with *Sample solution B*).

## **SPECIFIC TESTS**

• **\*SPECIFIC GRAVITY** (841): NMT 0.7962 at 15.56°, indicating NLT 99.2% of  $\text{C}_2\text{H}_5\text{OH}$  by weight.

• **ULTRAVIOLET ABSORPTION**

**Analytical wavelength:** 235–340 nm

**Cell:** 5 cm

**Reference:** Water

**Acceptance criteria**

**Absorbance:** NMT 0.40 at 240 nm; NMT 0.30 between 250 and 260 nm; NMT 0.10 between 270 and 340 nm

**Curve:** The spectrum shows a steadily descending curve with no observable peaks or shoulders.

• **\*CLARITY OF SOLUTION**

[NOTE—The *Sample solution* is to be compared to *Standard suspension A* and to water in diffused daylight 5 min after preparation of *Standard suspension A*.]

**Hydrazine solution:** 10 mg/mL of hydrazine sulfate in water. Allow to stand for 4–6 h.

**Methenamine solution:** Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

**Primary opalescent suspension:** Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

**Opalescence standard:** Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. This suspension should not be used beyond 24 h after preparation.

**Standard suspension A:** Dilute 5.0 mL of the *Opalescence standard* with water to 100.0 mL.

**Standard suspension B:** Dilute 10.0 mL of the *Opalescence standard* with water to 100.0 mL.

**Sample solution A:** Substance to be examined

**Sample solution B:** 1.0 mL of *Sample solution A* diluted with water to 20 mL. Allow to stand for 5 min before testing.

**Blank:** Water

#### Analysis

**Samples:** *Standard suspension A*, *Standard suspension B*, *Sample solution A*, *Sample solution B*, and *Blank*

Transfer a sufficient portion of *Sample solution A* and *Sample solution B* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard suspension A*, *Standard suspension B*, and *Blank* to separate matching test tubes. Compare samples in diffused daylight, viewing vertically against a black background (see *Nephelometry*, *Turbidimetry*, and *Visual Comparison* (855), *Visual Comparison*). The diffusion of light must be such that *Standard suspension A* can be readily distinguished from water, and *Standard suspension B* can be readily distinguished from *Standard suspension A*.

**Acceptance criteria:** *Sample solution A* and *Sample solution B* show the same clarity as that of water, or their opalescence is not more pronounced than that of *Standard suspension A*.

#### • ACIDITY OR ALKALINITY

**Phenolphthalein solution:** Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL.

**Sample:** 20 mL of Dehydrated Alcohol

**Analysis:** To the *Sample* add 20 mL of freshly boiled and cooled water and 0.1 mL of *Phenolphthalein solution*. The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide.

**Acceptance criteria:** The solution is pink (30 µg/g, expressed as acetic acid).

#### • COLOR OF SOLUTION

**Standard stock solution:** Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 mg/mL).

**Standard solution:** 1.0 mL of *Standard stock solution*, diluted with dilute hydrochloric acid (10 mg/mL) to 100 mL. Prepare the *Standard solution* immediately before use.

**Sample solution:** Substance to be examined

**Blank:** Water

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*

Transfer a sufficient portion of each of the *Samples* to individual test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Compare the *Samples* in diffused daylight, viewing vertically against a white background (see *Nephelometry*, *Turbidimetry*, and *Visual Comparison* (855), *Visual Comparison*).

**Acceptance criteria:** The *Sample solution* has the appearance of water or is not more intensely colored than the *Standard solution*.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.

#### • USP REFERENCE STANDARDS (11)

USP Dehydrated Alcohol RS

### Dehydrated Alcohol Injection

» Dehydrated Alcohol Injection is Dehydrated Alcohol suitable for parenteral use.

**Packaging and storage—**Preserve in tight, single-dose containers, preferably of Type I glass, and store at controlled room temperature. The container may contain an inert gas in the headspace.

#### Identification—

**A:** Mix 5 drops in a small beaker with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid, and cover the beaker immediately with a filter paper moistened with a solution recently prepared by dissolving 0.1 g of sodium nitroferricyanide and 0.25 g of piperazine in 5 mL of water: an intense blue color is produced on the filter paper, the color becoming paler after a few minutes.

**B:** To 5 mL of a solution (1 in 10) add 1 mL of 1.0 N sodium hydroxide, then slowly (over a period of 3 minutes) add 2 mL of 0.1 N iodine: the odor of iodoform develops, and a yellow precipitate is formed within 30 minutes.

**Specific gravity** (841): not more than 0.8035 at 15.5°, indicating not less than 96.8%, by weight, of  $C_2H_5OH$ .

**Acidity—**To 50 mL, in a glass-stoppered flask, add 50 mL of recently boiled water. Add phenolphthalein TS, and titrate with 0.020 N sodium hydroxide to a pink color that persists for 30 seconds: not more than 10.0 mL of 0.020 N sodium hydroxide is required for neutralization.

**Limit of nonvolatile residue—**Evaporate 40 mL in a tared dish on a water bath, and dry at 105° for 1 hour: the weight of the residue does not exceed 1 mg.

**Water-insoluble substances—**Dilute it with an equal volume of water: the mixture is clear and remains clear for 30 minutes after cooling to 10°.

**Aldehydes and other foreign organic substances—**Place 20 mL in a glass-stoppered cylinder that has been thoroughly cleaned with hydrochloric acid, then rinsed with water and finally with the dehydrated alcohol to be tested. Cool the contents to approximately 15°, and add, by means of a carefully cleaned pipet, 0.10 mL of 0.10 N potassium permanganate, noting accurately the time of addition. Mix at once by inverting the stoppered cylinder, and allow it to stand at 15° for 5 minutes: the pink color does not entirely disappear.

**Amyl alcohol and nonvolatile, carbonizable substances—**Allow 25 mL to evaporate spontaneously from a porcelain dish, carefully protected from dust, until the surface of the dish is barely moist: no red or brown color is produced immediately upon the addition of a few drops of sulfuric acid.

**Ultraviolet absorbance—**Record the UV absorption spectrum between 340 nm and 235 nm in a 1-cm cell, with water in a matched cell in the reference beam: the absorbance is not more than 0.08 at 240 nm, and 0.02 between 270 nm and 340 nm, and the curve drawn through these points is smooth.

**Limit of acetone and isopropyl alcohol—**To 1.0 mL add 1 mL of water, 1 mL of a saturated solution of dibasic sodium phosphate, and 3 mL of a saturated solution of potassium permanganate. Warm the mixture to 45° to 50°, and allow to stand until the permanganate color is discharged. Add 3 mL of 2.5 N sodium hydroxide, and pass, without washing, through a sintered-glass filter. Prepare a control containing 1 mL of the saturated solution of dibasic sodium

phosphate, 3 mL of 2.5 N sodium hydroxide, and 80 µg of acetone in 9 mL. To each solution add 1 mL of furfural solution (1 in 100), and allow to stand for 10 minutes, then to 1.0 mL of each solution add 3 mL of hydrochloric acid: any pink color produced in the test solution is not more intense than that in the control.

**Methanol**—To 1 drop add 1 drop of water, 1 drop of dilute phosphoric acid (1 in 20), and 1 drop of potassium permanganate solution (1 in 20). Mix, allow to stand for 1 minute, and add sodium metabisulfite solution (1 in 20), dropwise, until the permanganate color is discharged. If a brown color remains, add 1 drop of the dilute phosphoric acid. To the colorless solution add 5 mL of freshly prepared chromotropic acid TS, and heat on a water bath at 60° for 10 minutes: no violet color appears.

**Other requirements**—It meets the requirements under *Injections and Implanted Drug Products* (1).

## Alcohol in Dextrose Injection

### DEFINITION

Alcohol in Dextrose Injection is a sterile solution of Alcohol and Dextrose in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of alcohol (C<sub>2</sub>H<sub>5</sub>OH), and NLT 95.0% and NMT 105.0% of the labeled amount of dextrose (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub> · H<sub>2</sub>O).

### IDENTIFICATION

- **A.** **Sample solution:** A few drops of Injection (1 in 20) in water  
**Analysis:** Add the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.  
**Acceptance criteria:** A copious red precipitate of cuprous oxide is formed.
- **B. SPECIFIC GRAVITY (841):** NMT 0.7962 at 15.56°, indicating NLT 99.2% of alcohol (C<sub>2</sub>H<sub>5</sub>OH) by weight
- **C. INFRARED ABSORPTION (197S) or (197F):** Meets the requirements

### ASSAY

- **ALCOHOL DETERMINATION, Method 1—Distillation Method (611)**

**Sample solution:** 50.0 mL  
**Acceptance criteria:** 90.0%–110.0%

- **DEXTROSE**

**Sample:** Equivalent to 2–5 g of dextrose from a suitable volume of injection

**Analysis:** Transfer the *Sample solution* to a 100-mL volumetric flask, add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume. Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)).

Calculate the percentage of dextrose (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub> · H<sub>2</sub>O) in the portion of Injection taken:

$$\text{Result} = [(M_{r1}/M_{r2})/R_{mid}]AR \times 100$$

$M_{r1}$  = molecular weight of dextrose monohydrate, 198.17

$M_{r2}$  = molecular weight of anhydrous dextrose, 180.16

$R_{mid}$  = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

$A$  = 100 mm divided by the length of the polarimeter tube (mm)

$R$  = observed rotation (°)

**Acceptance criteria:** 95.0%–105.0%

### IMPURITIES

**Delete the following:**

- **HEAVY METALS (231)**

**Test preparation:** Equivalent to 4.0 g of dextrose from a volume of Injection

**Analysis:** Transfer the *Sample* to a vessel, and adjust the volume to 25 mL by evaporation or by addition of water, as necessary.

**Acceptance criteria:** NMT 5 × C ppm, where C is the labeled amount, in g, of dextrose (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub> · H<sub>2</sub>O) per mL of Injection (Official 1-Jan-2018)

- **LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

**Sample solution:** Equivalent to 2 mg/mL of dextrose in water from a suitable volume of Injection

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** 284 nm

**Cell:** 1 cm

**Blank:** Water

**Acceptance criteria:** The absorbance is NMT 0.25.

### SPECIFIC TESTS

- **pH (791):** 3.5–6.5

**Sample solution:** A portion of Injection to which 0.30 mL of saturated potassium chloride solution has been added for each 100 mL and which previously has been diluted with water, if necessary, to a concentration of NMT 5% of dextrose

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.5 USP Endotoxin unit/mL

- **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products* (1)

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, single-dose containers, preferably of Type I or Type II glass, and store at controlled room temperature.

- **LABELING:** The label states the total osmolality of the solution expressed in mOsmol/L.

- **USP REFERENCE STANDARDS (11)**  
USP Endotoxin RS

## Rubbing Alcohol

### DEFINITION

Rubbing Alcohol and all preparations under the classification of Rubbing Alcohols are manufactured in accordance with the requirements of the U.S. Treasury Department, Bureau of Alcohol, Tobacco, and Firearms, Formula 23-H (8 parts by volume of acetone, 1.5 parts by volume of methyl isobutyl ketone, and 100 parts by volume of ethyl alcohol) being used. It contains NLT 68.5% and NMT 71.5% by volume of dehydrated alcohol, the remainder consisting of water and the denaturants, with or without color additives, and perfume oils. Rubbing Alcohol contains, in each 100 mL, NLT 355 mg of sucrose octaacetate or NLT 1.40 mg of denatonium benzoate. The preparation may be colored with one or more color additives, listed by the FDA for use in drugs. A suitable stabilizer may be added. Rubbing Alcohol complies with the requirements of the Bureau of Alcohol, Tobacco, and Firearms of the U.S. Treasury Department.

[NOTE—Rubbing Alcohol is packaged, labeled, and sold in accordance with the regulations issued by the U.S. Treasury Department, Bureau of Alcohol, Tobacco, and Firearms.]

**ASSAY**• **DENATONIUM BENZOATE**

**Buffer:** 9.23 g of anhydrous dibasic sodium phosphate in 800 mL of water. Adjust with saturated citric acid solution to a pH of  $4 \pm 0.1$ , dilute with water to 1000 mL, and mix.

**Standard solution:** 50 µg/mL of USP Denatonium Benzoate RS in water

**Sample solution:** Dissolve the residue obtained in the test for *Limit of Nonvolatile Residue* in 50.0 mL of water, and transfer to a suitable flask.

**Instrumental conditions**

**Analytical wavelength:** Maximum absorbance at about 410 nm

**Cell:** 1 cm

**Analysis**

**Samples:** *Buffer*, *Standard solution*, and *Sample solution* Transfer 10.0 mL each of *Buffer*, *Standard solution*, and *Sample solution* to individual 250-mL separators. Add to each 40 mL of *Buffer* 10 mL of a 1-in-1000 solution of bromophenol blue in chloroform and 60 mL of chloroform. Shake the separators vigorously for 2 min, allow to stand for 15 min, then withdraw the chloroform layers through chloroform-washed cotton into 100-mL volumetric flasks. Repeat the extraction with 20 mL of chloroform, adding the filtered chloroform extracts to the respective volumetric flasks, and dilute with chloroform to volume. Without delay, concomitantly determine the absorbances of the solutions, using the blank to set a suitable spectrophotometer. Calculate the quantity, in mg, of denatonium benzoate ( $C_{28}H_{34}N_2O_3 \cdot H_2O$ ) in 100 mL of Rubbing Alcohol:

$$\text{Result} = (A_U/A_S) \times C_S \times 0.025$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Denatonium Benzoate RS in the *Standard solution* (µg/mL)

**Acceptance criteria:** NLT 1.40 mg

• **SUCROSE OCTAACETATE**

**Sample solution:** Using about 50 mL of 70% alcohol, transfer the residue obtained in the test for *Limit of Nonvolatile Residue* to a 500-mL conical flask.

**Analysis:** Neutralize the *Sample solution* with 0.1 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Add 25.0 mL of 0.1 N sodium hydroxide, attach an air condenser to the flask, and reflux on a steam bath for 1 h. Remove from the steam bath, cool quickly, and titrate the excess alkali with 0.1 N sulfuric acid VS, using phenolphthalein TS as the indicator. Perform a blank determination (see *Titrimetry* <541>, *Residual Titrations*). Each mL of 0.1 N sodium hydroxide is equivalent to 8.483 mg of sucrose octaacetate ( $C_{28}H_{38}O_{19}$ ).

**Acceptance criteria:** NLT 355 mg of sucrose octaacetate per 100 mL of Rubbing Alcohol

**IMPURITIES**• **METHANOL**

**Sample solution:** Dilute 0.50 mL of Rubbing Alcohol with water to 1.0 mL.

**Analysis:** To 0.50 mL of the *Sample solution* add 1 drop of dilute phosphoric acid (1 in 20) and 1 drop of potassium permanganate solution (1 in 20). Mix, allow to stand for 1 min, and add dropwise sodium metabisulfite solution (1 in 20) until the permanganate color is discharged. If a brown color remains, add 1 drop of dilute phosphoric acid (1 in 20). To the colorless solution add 5 mL of freshly prepared chromotropic acid TS, and heat in a water bath at 60° for 10 min.

**Acceptance criteria:** No violet color appears.

**SPECIFIC TESTS**

• **SPECIFIC GRAVITY** <841>: 0.8691–0.8771 at 15.56° (the U.S. government standard temperature for alcohol determination) for Rubbing Alcohol manufactured with specially denatured alcohol Formula 23-H

• **LIMIT OF NONVOLATILE RESIDUE**

Where the denaturant is denatonium benzoate

**Sample:** 200.0 mL of Rubbing Alcohol

**Analysis:** Evaporate the *Sample*, transferred in convenient portions, in a suitable tared dish on a steam bath, and dry the residue at 105° for 1 h. Retain the residue for the *Assay for Denatonium Benzoate*.

**Acceptance criteria:** The weight of the residue is NLT 2.8 mg.

Where the denaturant is sucrose octaacetate

**Sample:** 25.0 mL of Rubbing Alcohol

**Analysis:** Evaporate the *Sample* in a suitable tared dish on a steam bath, and dry the residue at 105° for 1 h. Retain the residue for the *Assay for Sucrose Octaacetate*.

**Acceptance criteria:** The weight of the residue is NLT 89 mg.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers, remote from fire, and store at controlled room temperature.

• **LABELING:** Label it to indicate that it is flammable.

• **USP REFERENCE STANDARDS** (11)

USP Denatonium Benzoate RS

**Alendronate Sodium**

$C_{12}H_{12}NNaO_7P_2 \cdot 3H_2O$

325.12

Phosphonic acid, (4-amino-1-hydroxybutylidene) bis-, monosodium salt, trihydrate;

Sodium trihydrogen (4-amino-1-hydroxybutylidene)diphosphonate, trihydrate [121268-17-5].

**DEFINITION**

Alendronate Sodium contains NLT 98.0% and NMT 102.0% of alendronate sodium ( $C_{12}H_{12}NNaO_7P_2$ ), calculated on the dried basis.

**IDENTIFICATION**

• **A. INFRARED ABSORPTION** <197M>

• **B. IDENTIFICATION TESTS—GENERAL, Sodium** <191>: Meets the requirements of the pyroantimonate precipitation test

**ASSAY**• **PROCEDURE**

**Buffer solution:** 14.7 g/L of sodium citrate dihydrate and 7.05 g/L of anhydrous dibasic sodium phosphate. Adjust with phosphoric acid to a pH of 8.

**Mobile phase:** Acetonitrile, methanol, and *Buffer solution* (25:5:70)

**Diluent:** 29.4 g/L of sodium citrate dihydrate

**Borate solution:** 19.1 g/L of sodium borate

**Solution A:** 0.5 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [NOTE—Prepare this solution fresh just before use.]

**Standard stock solution:** 0.1 mg/mL of USP Alendronate Sodium RS in *Diluent*

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of *Solution A*, and shake for 30 s. Allow to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min. Use a portion of the clear upper aqueous layer.

**Reagent blank:** Transfer 5.0 mL of *Diluent* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of *Solution A*, and shake for 30 s. Allow to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min. Use a portion of the clear upper aqueous layer.

**Sample stock solution:** 0.1 mg/mL of Alendronate Sodium in *Diluent*

**Sample solution:** Transfer 5.0 mL of the *Sample stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of *Solution A*, and shake for 30 s. Allow to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min. Use a portion of the clear upper aqueous layer.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 266 nm

**Column:** 4.1-mm × 25-cm; packing L21

**Column temperature:** 35°

**Flow rate:** 1.2 mL/min

**Injection volume:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0% for replicate injections

#### Analysis

**Samples:** *Standard solution*, *Reagent blank*, and *Sample solution*

Calculate the percentage of alendronate sodium ( $C_4H_{12}NNaO_7P_2$ ) in the portion of Alendronate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Alendronate Sodium RS in the *Standard stock solution* (mg/mL)

$C_U$  = concentration of Alendronate Sodium in the *Sample stock solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

#### IMPURITIES

##### Delete the following:

• **HEAVY METALS, Method III (231):** 0.001% (Official 1-Jan-2018)

##### • ORGANIC IMPURITIES

**Buffer solution:** 2.94 g/L of sodium citrate dihydrate and 1.42 g/L of anhydrous dibasic sodium phosphate. Adjust with phosphoric acid to a pH of 8 and pass through a filter of 0.5-µm or finer pore size.

**Solution A:** Acetonitrile and *Buffer solution* (3:17)

**Solution B:** Acetonitrile and *Buffer solution* (7:3)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	50	50
25	0	100
27	100	0
32	100	0

**Diluent and Borate solution:** Proceed as directed in the Assay.

**Solution C:** 4 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [NOTE—Prepare this solution fresh just before use.]

**Standard stock solution:** 0.6 mg/mL of USP Alendronate Sodium RS in *Diluent*

**Standard solution A:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

**Standard solution B:** 0.6 µg/mL of USP Alendronate Sodium RS in *Diluent* from *Standard stock solution*. Transfer 5 mL of this diluted solution (0.6 µg/mL) to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

**Reagent blank:** Transfer 5.0 mL of *Diluent* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

**Sample stock solution:** 0.6 mg/mL of Alendronate Sodium in *Diluent*

**Sample solution:** Transfer 5.0 mL of *Sample stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 266 nm

**Column:** 4.1-mm × 25-cm; packing L21

**Column temperature:** 45°

**Flow rate:** 1.8 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** *Standard solution A* and *Standard solution B*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for the main peak, *Standard solution A*

**Signal-to-noise ratio:** NLT 3 for the main peak, *Standard solution B*

#### Analysis

**Samples:** *Reagent blank* and *Sample solution*

[NOTE—Disregard any peak corresponding to those obtained from the *Reagent blank*.]

Calculate the percentage of each impurity in the portion of Alendronate Sodium taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak area of each impurity

$r_T$  = sum of all impurity peaks and the main peak

#### Acceptance criteria

Individual impurities: NMT 0.1%

Total impurities: NMT 0.5%

#### SPECIFIC TESTS

##### • LOSS ON DRYING (731)

Sample: Dry at a pressure of NMT 5 mm of mercury at 140° to constant weight.

Acceptance criteria: 16.1%–17.1%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.

##### • USP REFERENCE STANDARDS (11)

USP Alendronate Sodium RS

## Alendronate Sodium Tablets

#### DEFINITION

Alendronate Sodium Tablets contain an amount of Alendronate Sodium equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of alendronic acid ( $C_4H_7NO_7P_2$ ).

#### IDENTIFICATION

• The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Solution A:** 14.7 g/L of sodium citrate dihydrate and 7.05 g/L of anhydrous dibasic sodium phosphate in water. [NOTE—Adjust with phosphoric acid to a pH of 8.0 before bringing the solution to volume.]

**Solution B:** 38.1 g/L of sodium borate in water

**Solution C:** 1 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [NOTE—Prepare this solution fresh just before use.]

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (20:5:75)

**Diluent:** 29.4 g/L of sodium citrate dihydrate in water

**Standard stock solution:** 0.03 mg/mL of anhydrous alendronate sodium in *Diluent*, from USP Alendronate Sodium RS

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 5 mL of *Solution B*, and mix for 3 min. Add 4 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 10 min. Use the clear upper aqueous layer.

**Sample stock solution:** Transfer NLT 10 Tablets to a 1000-mL volumetric flask. Add 500 mL of *Diluent*, shake by mechanical means for 30 min, and sonicate for 5 min. Dilute with *Diluent* to volume, and centrifuge a portion of this solution. Quantitatively dilute a portion of the clear supernatant to a concentration of 0.02–0.03 mg/mL of alendronic acid.

**Sample solution:** Transfer 5.0 mL of the *Sample stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 5 mL of *Solution B*, and mix for 3 min. Add 4 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add

25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 10 min. Use the clear upper aqueous layer.

**Blank:** Transfer 5 mL of *Diluent* to a 50-mL polypropylene screw-cap centrifuge tube containing 5 mL of *Solution B*, and mix for 3 min. Add 4 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 10 min. Use the clear upper aqueous layer.

#### Chromatographic system

**Column temperature:** 35°

**Flow rate:** 1 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Capacity factor:** NLT 2.0

**Relative standard deviation:** NMT 2.0% for replicate injections

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the label claim in the portion of  $C_4H_{13}NO_7P_2$  taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of anhydrous USP Alendronate Sodium RS in the *Standard stock solution* (mg/mL)

$C_U$  = nominal concentration of alendronic acid in the *Sample stock solution* (mg/mL)

$M_{r1}$  = molecular weight of alendronic acid, 249.10

$M_{r2}$  = molecular weight of anhydrous alendronate sodium, 271.09

**Acceptance criteria:**  $C_4H_{12}NNaO_7P_2$  equivalent to 90.0%–110.0% of the labeled amount of  $C_4H_{13}NO_7P_2$

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

###### Test 1

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 15 min

Determine the amount of  $C_4H_{13}NO_7P_2$  dissolved by using the following method.

**Solution A and Mobile phase:** Proceed as directed in the *Assay*.

**Diluent:** 176.4 g/L of sodium citrate in *Medium*

**Solution B:** Dissolve 6.2 g of boric acid in approximately 950 mL of water. Adjust with 1 N sodium hydroxide to a pH of 9.0, and dilute with water to 1 L.

**Solution C:** 0.5 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [NOTE—Prepare this solution fresh.]

**Standard stock solution:** USP Alendronate Sodium RS in *Medium* to make a concentration equivalent to dissolving 1 Tablet in 900 mL of the same *Medium*. Calculate the concentration,  $C$  (mg/mL), of anhydrous alendronate sodium in this solution.

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Solution B*, and mix for 3 min. Add 4.0 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 5 min. Use a portion of the clear, upper aqueous layer.

**Blank:** Transfer 5 mL of water to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Solution B*, and mix for 3 min. Add 4.0 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 5 min. Use a portion of the clear, upper aqueous layer.

**Sample solution:** Withdraw a portion of the solution under test, and centrifuge immediately. Transfer 5.0 mL of the supernatant to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Solution B*, and mix for 3 min. Add 4.0 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 5 min. Use a portion of the clear, upper aqueous layer.

**Chromatographic system and System suitability:**

Proceed as directed in the *Assay*.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_4H_{13}NO_7P_2$  dissolved:

$$\text{Result} = (r_U/r_S) \times C \times (M_{r1}/M_{r2}) \times V \times (100/L)$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C$  = defined under the *Standard stock solution*

$M_{r1}$  = molecular weight of alendronic acid, 249.10

$M_{r2}$  = molecular weight of alendronate sodium, 271.09

$V$  = volume of the *Medium*, 900 mL

$L$  = Tablet label claim (mg)

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_4H_{13}NO_7P_2$  is dissolved; for tablets labeled for weekly dosing, NLT 75% (Q) of the labeled amount of  $C_4H_{13}NO_7P_2$  is dissolved.

**Test 2**

If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

Determine the amount of  $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$  dissolved using the following method.

**Solution B and Solution C:** Proceed as directed in the *Assay*.

**0.6 M citrate buffer:** 176.4 g/L of sodium citrate dihydrate in water

**0.05 M buffer:** Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a 1000-mL volumetric flask, dissolve in about 900 mL of water, adjust with phosphoric acid to a pH of 8.0, and dilute with water to volume.

**Mobile phase:** 0.05 M buffer, acetonitrile, and methanol (76:19:5)

**Standard stock solution:** Prepare a solution of USP Alendronate Sodium RS in *Medium* with a final concentration corresponding to the concentration obtained by dissolving 1 tablet in 900 mL of *Medium*. Calculate the concentration,  $C$  (mg/mL), of anhydrous alendronate sodium in this solution.

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL screw-cap polypropylene centrifuge tube containing 1.0 mL of 0.6 M citrate buffer and 5.0 mL of *Solution B*, and mix for about 3 min. Add 4.0 mL of *Solution C*, and agitate for about 30 s. Allow the solution to stand at room temperature for about 30 min. Add 25 mL of methylene chloride, and agitate vigorously for about 40 s. Centrifuge the mixture for 10 min. Use a portion of the clear upper aqueous layer.

**Blank:** Using 5 mL of water, proceed as directed for the *Standard solution*, beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

**Sample solution**

**For Tablets labeled to contain 5 mg, 10 mg, 35 mg, or 40 mg:** After 30 min, withdraw 30 mL of the solution under test, and pass through a suitable 0.45- $\mu$ m filter, discarding the first 10 mL. Using 5.0 mL of the filtrate, proceed as directed for the *Standard solution*, beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

**For Tablets labeled to contain 70 mg:** After 30 min, withdraw 30 mL of the solution under test, and pass through a suitable 0.45- $\mu$ m filter, discarding the first 10 mL. Transfer 6.0 mL of the filtrate to a 10-mL volumetric flask, and dilute with water to volume. Using 5.0 mL of this dilution, proceed as directed for the *Standard solution*, beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

**Chromatographic system and System suitability:**

Proceed as directed in the *Assay*.

**Analysis:** Proceed as directed in *Test 1*.

**Tolerances:** NLT 80% (Q) of the labeled amount of alendronate sodium ( $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 30°.
- **LABELING:** The labeling indicates weekly dosing where appropriate. When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**  
USP Alendronate Sodium RS

## Alfentanil Hydrochloride

$C_{21}H_{32}N_6O_3 \cdot HCl \cdot H_2O$  470.99

$C_{21}H_{32}N_6O_3 \cdot HCl$  452.98

Propanamide, *N*-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)-4-piperidinyl]-*N*-phenyl, monohydrochloride, monohydrate;

*N*-[1-[2-(4-Ethyl-5-oxo-2-tetrazolin-1-yl)-ethyl]-4-(methoxymethyl)-4-piperidyl]propionanilide monohydrochloride monohydrate [70879-28-6].

Anhydrous [69049-06-5].

**DEFINITION**

Alfentanil Hydrochloride contains NLT 98.0% and NMT 102.0% of alfentanil hydrochloride ( $C_{21}H_{32}N_6O_3 \cdot HCl$ ), calculated on the anhydrous basis.

**[CAUTION—**Handle Alfentanil Hydrochloride with great care because it is a potent opioid analgesic. Great care should be taken to prevent inhaling particles of Alfentanil Hydrochloride and exposing the skin to it.]

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Acetonitrile and 0.01 M tetrabutylammonium hydrogen sulfate (14:86)

**Standard solution:** 0.54 mg/mL of USP Alfentanil Hydrochloride RS in *Mobile phase*

**Sample solution:** 0.54 mg/mL of Alfentanil Hydrochloride in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.0-mm × 25-cm; 5-μm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 25 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 5400 theoretical plates

**Tailing factor:** NMT 1.3

**Relative standard deviation:** NMT 0.73%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alfentanil hydrochloride ( $C_{21}H_{32}N_6O_3 \cdot HCl$ ) in the portion of Alfentanil Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alfentanil Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alfentanil Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES**

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **ORGANIC IMPURITIES**

**Mobile phase:** Acetonitrile and 0.01 M tetrabutylammonium hydrogen sulfate (14:86)

**Standard solution:** 0.54 mg/mL of USP Alfentanil Hydrochloride RS in *Mobile phase*

**Sample solution:** 0.54 mg/mL of Alfentanil Hydrochloride in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 25 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 5400 theoretical plates

**Tailing factor:** NMT 1.3

**Relative standard deviation:** NMT 0.73%

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Alfentanil Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of all the peak responses

**Acceptance criteria**

**Any single impurity:** NMT 0.5%

**Total impurities:** NMT 1.0%

**SPECIFIC TESTS**

• **WATER DETERMINATION, Method I** (921): NMT 4.0%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Alfentanil Hydrochloride RS

**Alfentanil Injection****DEFINITION**

Alfentanil Injection is a sterile solution of Alfentanil Hydrochloride in Water for Injection. It contains an amount of Alfentanil Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of alfentanil ( $C_{21}H_{32}N_6O_3$ ).

[**CAUTION**—Handle Alfentanil Injection with great care because it is a potent opioid analgesic.]

**IDENTIFICATION**

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

**Standard solution:** 0.54 mg/mL of USP Alfentanil Hydrochloride RS

**Sample solution:** 0.5 mg/mL of alfentanil in water

**Chromatographic system**

**Application volume:** 200 μL

**Developing solvent system:** Chloroform, methanol, and formic acid (85:10:5)

**Visualizing agent:** Dragendorff's reagent

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in the chapter.

**Acceptance criteria:** Meets the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Acetonitrile and 0.01 M tetrabutylammonium hydrogen sulfate (14:86)

**Standard solution:** 0.54 mg/mL of USP Alfentanil Hydrochloride RS in saline TS

**Sample solution:** Equivalent to 0.50 mg/mL of alfentanil from a suitable volume of Injection in saline TS

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 25 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 5400 theoretical plates

**Tailing factor:** NMT 1.3

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alfentanil ( $C_{21}H_{32}N_6O_3$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

- $r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Alfentanil Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of alfentanil in the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of alfentanil, 416.52  
 $M_{r2}$  = molecular weight of alfentanil hydrochloride, 452.98

Acceptance criteria: 90.0%–110.0%

## IMPURITIES

### • ORGANIC IMPURITIES

**Mobile phase:** Acetonitrile and 0.01 M tetrabutylammonium hydrogen sulfate (14:86)

**Standard solution:** 0.54 mg/mL of USP Alfentanil Hydrochloride RS in saline TS

**Sample solution:** Equivalent to 0.50 mg/mL of alfentanil from a suitable volume of Injection in saline TS

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 25 μL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 5400 theoretical plates

**Tailing factor:** NMT 1.3

**Relative standard deviation:** NMT 1.0%

### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_u/r_T) \times 100$$

$r_u$  = peak response of each impurity

$r_T$  = sum of all of the peaks

**Acceptance criteria:** The sum of all impurities is NMT 2.0%.

## SPECIFIC TESTS

- **pH (791):** 4.0–6.0
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **BACTERIAL ENDOTOXINS TEST (85):** NMT 10 USP Endotoxin Units/mL
- **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products* (1)

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, single-dose or multiple-dose containers, preferably of Type I glass, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
 USP Alfentanil Hydrochloride RS  
 USP Endotoxin RS

## Alfuzosin Hydrochloride

$C_{19}H_{27}N_5O_4 \cdot HCl$  425.91  
 2-Furancarboxamide, N-[3-[(4-amino-6,7-dimethoxy-2-quinazolinyl)methylamino]propyl]tetrahydro-, monohydrochloride (±);

(±)-N-[3-[(4-Amino-6,7-dimethoxy-2-quinazolinyl)methylamino]propyl]tetrahydro-2-furamide monohydrochloride [81403-68-1].

## DEFINITION

Alfuzosin Hydrochloride contains NLT 98.0% and NMT 102.0% of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ), calculated on the anhydrous and solvent-free basis.

## IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements
- **C.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

## ASSAY

### • PROCEDURE

[NOTE—Use low-actinic glassware.]

**Solution A:** 2 M sodium hydroxide

**Solution B:** 5.0 mL of perchloric acid in 900 mL of water. Adjust with *Solution A* to a pH of 3.5, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile and *Solution B* (30:70)

**Diluent:** Methanol and *Solution A* (500:3)

**Standard stock solution:** 0.5 mg/mL of USP Alfuzosin Hydrochloride RS in *Diluent*

**Standard solution:** 0.04 mg/mL of USP Alfuzosin Hydrochloride RS in *Mobile phase* from the *Standard stock solution*; the solution is stable for 14 h at 5°.

**Sample stock solution:** 0.5 mg/mL of Alfuzosin Hydrochloride in *Diluent*

**Sample solution:** 0.04 mg/mL of Alfuzosin Hydrochloride in *Mobile phase* from the *Sample stock solution*; the solution is stable for 14 h at 5°.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Column temperature:** 30°

**Autosampler temperature:** 5°

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 μL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Relative standard deviation:** NMT 1.0%

**Tailing factor:** NMT 1.5

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) in the portion of Alfuzosin Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Alfuzosin Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous and solvent-free basis

## IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

### • ORGANIC IMPURITIES

**Buffer:** Dilute 5 mL of perchloric acid in 900 mL of water. Adjust with 2 M sodium hydroxide to a pH of 3.5, and dilute with water to 1 L.

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Buffer* (20:1:80)

**System suitability solution:** 0.4 mg/mL of USP Alfuzosin System Suitability Mixture RS in *Mobile phase*

**Sample solution:** 0.40 mg/mL of Alfuzosin Hydrochloride in *Mobile phase*

**Reference solution:** 0.40 µg/mL of Alfuzosin Hydrochloride in *Mobile phase* from the *Sample solution*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 µL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Peak-to-valley ratio:** The ratio of the height of the furamide analog peak to the height of the valley between the furamide analog peak and alfuzosin is NLT 5.

#### Analysis

**Samples:** *Sample solution* and *Reference solution*

Calculate the percentage of each impurity in the portion of Alfuzosin Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (1/D) \times 100$$

$r_u$  = peak response of each impurity from the *Sample solution*

$r_s$  = peak response of alfuzosin from the *Reference solution*

$D$  = dilution factor between the *Sample solution* and the *Reference solution*, 1000

**Acceptance criteria:** See *Table 1*. [NOTE—Disregard any peak with an area less than 0.05%.]

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Deacylatedalfuzosin <sup>a</sup>	0.5	0.20
Alfuzosin	1.0	—
Furamide analog <sup>b</sup>	1.2	— <sup>c</sup>
Any other individual, unidentified impurity	—	0.10
Total impurities	—	0.30

<sup>a</sup> N<sup>2</sup>-(3-Aminopropyl)-6,7-dimethoxy-N<sup>2</sup>-methylquinazoline-2,4-diamine.

<sup>b</sup> N-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide.

<sup>c</sup> Furamide analog, a component of USP Alfuzosin System Suitability Mixture RS, is not a specified impurity.

#### SPECIFIC TESTS

##### • OPTICAL ROTATION (781)

**Sample solution:** 20 mg/mL in carbon dioxide-free water

**Acceptance criteria:** −0.10° to +0.10°

##### • WATER DETERMINATION, Method I (921): NMT 2.0%

##### • PH (791)

**Sample solution:** 20 mg/mL in carbon dioxide-free water

**Acceptance criteria:** 4.0–5.5

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Protect from light and humidity, and store at room temperature.

##### • USP REFERENCE STANDARDS (11)

USP Alfuzosin Hydrochloride RS

USP Alfuzosin System Suitability Mixture RS

Alfuzosin Hydrochloride containing approximately 0.4% furamide analog (N-[3-[(4-amino-6,7-dimethoxy-

quinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide), and about 0.4% deacylated alfuzosin (N<sup>2</sup>-(3-aminopropyl)-6,7-dimethoxy-N<sup>2</sup>-methylquinazoline-2,4-diamine).

## Alfuzosin Hydrochloride Extended-Release Tablets

#### DEFINITION

Alfuzosin Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alfuzosin hydrochloride (C<sub>19</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub> · HCl).

#### IDENTIFICATION

- **A. INFRARED ABSORPTION (197):** [NOTE—Methods described in (197K) or (197A) may be used.]

**Sample:** Grind 4 Tablets, and add 20 mL of water.

[NOTE—When analyzing multi-layer Tablets, isolate the layer containing alfuzosin hydrochloride using a suitable tool.] Add 20 mL of strong ammonia solution. Extract with 20 mL of methylene chloride, and separate the organic layer. Repeat the extraction successively with 20 mL, then with 10 mL of methylene chloride. Wash the combined organic layers with 20 mL of water. Dry the organic solution using a phase separation filter. Take 2.0 mL of the dried organic solution, and mix with 200 mg of finely ground potassium bromide. Evaporate the methylene chloride at 60°, then at 105° for 30 min. Make a disk. Alternatively, evaporate methylene chloride from the dried organic solution at 60°, then at 105° for 30 min. Perform the IR spectrum.

**Acceptance criteria:** The maxima of the spectrum obtained from the *Sample* correspond in position and relative intensity to those obtained from USP Alfuzosin Hydrochloride RS, treated in the same manner as the *Sample*, beginning with "add 20 mL of water."

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

#### ASSAY

##### • PROCEDURE

**Solution A:** 5.0 mL of perchloric acid in 900 mL of water. Adjust with 2 M sodium hydroxide to a pH of 3.5, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Solution A* (20:1:80)

**Diluent:** 0.01 N hydrochloric acid

**Standard stock solution:** 0.15 mg/mL of USP Alfuzosin Hydrochloride RS in methanol

**Standard solution:** 0.03 mg/mL of USP Alfuzosin Hydrochloride RS in *Diluent* from the *Standard stock solution*

**Sample stock solution:** Place a suitable number of Tablets into a suitable volumetric flask to obtain a solution having a concentration of 0.16 mg/mL of alfuzosin hydrochloride. Add 80% of the flask volume of methanol, and stir for at least 1 h using a magnetic stirrer. Add 10% of the flask volume of *Diluent*, mix, and allow it to cool to room temperature. Dilute the resulting suspension with methanol to volume, stir, and allow to settle for 30 min.

**Sample solution:** 0.03 mg/mL of alfuzosin hydrochloride in *Diluent* from the *Sample stock solution* supernatant. Pass through a suitable filter.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 254 nm  
 Column: 4.6-mm × 15-cm; 5-μm packing L1  
 Flow rate: 1.5 mL/min  
 Injection volume: 20 μL  
 System suitability  
 Sample: *Standard solution*  
 Suitability requirements  
 Tailing factor: 0.8–1.5 for alfuzosin  
 Relative standard deviation: NMT 2.0%  
 Analysis  
 Samples: *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### Change to read:

#### • DISSOLUTION (711)

##### Test 1

Medium: 0.01 N hydrochloric acid; 500 mL

Apparatus 2: 100 rpm, with Tablet holder (see Figure 1)

Figure 1. 37.5-mm (l) × 20-mm (d) stainless steel cylinders are used as sample holders. The cylinders contain screw caps drilled with seven 4.5-mm holes. Seven 4.5-mm holes are drilled in the bottom, and 12 longitudinal series of five 5-mm holes are drilled on the cylinders, alternatively starting and ending with one 1.7-mm hole.

Times: 1, 6, 12, and 20 h

Sample solution: Pass a portion of the solution under test through a suitable filter.

Standard solution: ( $L/500$ ) mg/mL of USP Alfuzosin Hydrochloride RS in *Medium*, where  $L$  is the Tablet label claim in mg

Detector: UV 330 nm

Blank: *Medium*

Path length: 1 cm

Tolerances: See Table 1.

Table 1

Level	Time (h)	Amount Dissolved (%)
L1		Each Tablet:
	1	10–20
	6	40–55
	12	65–85
	20	NLT 85
L2		Average of 12 Tablets complies with L1 and each Tablet:
	1	9–22
	6	36–61
	12	59–94
	20	NLT 77
L3		Average of 24 Tablets complies with L1, NMT 2 Tablets outside L2, and all Tablets within:
	1	8–24
	6	32–66
	12	52–102
	20	NLT 68

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 100 rpm

Times: 1, 3, 12, and 24 h

Buffer: Dilute 5.0 mL of perchloric acid in 900 mL of water, adjust with diluted sodium hydroxide (0.1 g/mL) to a pH of  $3.5 \pm 0.5$ , and dilute with water to 1 L.

Mobile phase: Acetonitrile and Buffer (25:75)

Standard stock solution: 0.28 mg/mL of USP Alfuzosin Hydrochloride RS, prepared as follows. In a 200-mL volumetric flask dissolve 55.5 mg of USP Alfuzosin Hydrochloride RS in 5 mL of methanol, sonicate to dissolve, and dilute with *Medium* to volume.

Standard solution: 0.011 mg/mL of USP Alfuzosin Hydrochloride RS in *Medium* from the *Standard stock solution*

Sample solution: Pass a portion of the solution under test through a suitable filter. Replace the portion of solution withdrawn with an equal volume of *Medium*.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 244 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 30°

Flow rate: 1.2 mL/min

Injection volume: 20 μL

#### System suitability

Sample: *Standard solution*

#### Suitability requirements

Tailing factor: NMT 2.0

Column efficiency: NLT 3000 theoretical plates

Relative standard deviation: NMT 2.0%

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration ( $C$ ) of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) dissolved at each time point ( $i$ ):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$C_i$  = concentration of alfuzosin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label claim (mg/Tablet)  
 $V_3$  = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See Table 2.

Table 2

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 20
2	3	15–35
3	12	50–70
4	24	NLT 80

The percentages of the labeled amount of alfuzosin hydrochloride dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium:** 0.25% sodium dodecyl sulfate in 0.05 M sodium phosphate buffer, pH 6.8 (2.5 g/L of sodium dodecyl sulfate, 6.9 g/L of monobasic sodium phosphate monohydrate, and 0.83 g/L of sodium hydroxide in water previously degassed with helium. Adjust with either phosphoric acid or 1 N sodium hydroxide to a pH of  $6.8 \pm 0.05$ ); 900 mL

**Apparatus 1:** 100 rpm

**Times:** 1, 6, 12, and 24 h

**Standard stock solution:** 1.1 mg/mL of USP Alfuzosin Hydrochloride RS in methanol

**Standard solution:** 0.011 mg/mL of USP Alfuzosin Hydrochloride RS in *Medium* from the *Standard stock solution*

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Instrumental conditions**

(See *Ultraviolet-Visible Spectroscopy* (857).)

**Mode:** UV-Vis

**Analytical wavelength:** 331 nm, background correction at 490 nm

**Blank:** *Medium*

**Cell:** 1.0 cm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) dissolved at each time point ( $i$ ):

$$\text{Result}_1 = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

$A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium* (mL)

$L$  = label claim (mg/Tablet)

**Tolerances:** See Table 3.

Table 3

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 15
2	6	20–40
3	12	45–70
4	24	NLT 80

The percentages of the labeled amount of alfuzosin hydrochloride dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

**Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium:** 0.01 N hydrochloric acid; 900 mL

**Apparatus 2:** 100 rpm

**Times:** 1, 6, 12, and 20 h

**Standard solution:** 0.01 mg/mL of USP Alfuzosin Hydrochloride RS in *Medium*

**Sample solution:** Centrifuge a portion of the solution under test.

**Instrumental conditions**

(See *Ultraviolet-Visible Spectroscopy* (857).)

**Mode:** UV

**Analytical wavelength:** 245 nm

**Blank:** *Medium*

**Path length:** 0.2 cm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration ( $C_i$ ) of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result}_1 = (A_U/A_S) \times C_S$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) dissolved at each time point ( $i$ ):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times (V - V_3)) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times [V - (2 \times V_3)]) + [(C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{(C_4 \times [V - (3 \times V_3)]) + [(C_3 + C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$C_i$  = concentration of alfuzosin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

$V_3$  = volume of the *Sample solution* withdrawn at each time point (mL)

**Tolerances:** See Table 4.

Table 4

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 30
2	6	40–60
3	12	65–85
4	20	NLT 80

The percentages of the labeled amount of alfuzosin hydrochloride dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

**Test 5:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

**Medium:** 0.01 N hydrochloric acid; 900 mL

**Apparatus 2:** 100 rpm

**Times:** 1, 3, 6, 12, and 20 h

**Buffer:** Add 1 mL of triethylamine in 1000 mL of water. Adjust with phosphoric acid to a pH of  $2.5 \pm 0.05$ . Pass through a suitable filter of 0.45- $\mu$ m pore size.

**Mobile phase:** Methanol and Buffer (40:60)

**Standard stock solution:** 0.55 mg/mL of USP Alfuzosin Hydrochloride RS. Prepare by transferring a portion of USP Alfuzosin Hydrochloride RS to a suitable flask. Add methanol to 20% of the flask volume, and sonicate at room temperature to dissolve. Dilute with Medium to volume.

**Standard solution:** 0.011 mg/mL of USP Alfuzosin Hydrochloride RS in Medium from the Standard stock solution. Pass through a suitable filter of 0.45- $\mu$ m pore size.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 245 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** Standard solution

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Column efficiency:** NLT 2000 theoretical plates

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** Standard solution and Sample solution

Calculate the concentration ( $C_i$ ) of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result}_i = (r_u/r_s) \times C_s$$

$r_u$  = peak response from the Sample solution

$r_s$  = peak response from the Standard solution

$C_s$  = concentration of USP Alfuzosin Hydrochloride RS in the Standard solution (mg/mL)

Calculate the percentage of the labeled amount of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) dissolved at each time point ( $i$ ):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_s)] + (C_1 \times V_s)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_s)]] + [(C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times [V - (3 \times V_s)]] + [(C_3 + C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$$\text{Result}_5 = \{[C_5 \times [V - (4 \times V_s)]] + [(C_4 + C_3 + C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$C_i$  = concentration of alfuzosin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)

$V$  = volume of Medium, 900 mL

$L$  = label claim (mg/Tablet)

$V_s$  = volume of the Sample solution withdrawn at each time point (mL)

**Tolerances:** See Table 5.

Table 5

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 20
2	3	20–40
3	6	35–55
4	12	60–80
5	20	NLT 80

The percentages of the labeled amount of alfuzosin hydrochloride dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

**Test 6:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

**Medium:** 0.01 N hydrochloric acid; 900 mL

**Apparatus 2:** 100 rpm. Adjust the paddle height to 4.5 cm above the bottom of the vessel and use a 10# mesh basket as sinker.

**Times:** 1, 6, 12, and 20 h

**Buffer:** 2.3 g/L of anhydrous dibasic sodium phosphate and 1.75 g/L of monobasic potassium phosphate

**Mobile phase:** Acetonitrile and Buffer (50:50)

**Standard stock solution:** 0.45 mg/mL of USP Alfuzosin Hydrochloride RS. Prepare by transferring a portion of USP Alfuzosin Hydrochloride RS to a suitable flask. Add 20% of the flask volume of water. Sonicate to dissolve, and dilute with Medium to volume.

**Standard solution:** 0.011 mg/mL of USP Alfuzosin Hydrochloride RS in Medium from the Standard stock solution

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Replace with the same volume of Medium.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 254 nm  
 Column: 4.6-mm × 25-cm; 5-μm packing L1  
 Column temperature: 30°  
 Flow rate: 1 mL/min  
 Injection volume: 20 μL

**System suitability**

Sample: *Standard solution*  
 Suitability requirements  
 Tailing factor: NMT 2.0  
 Column efficiency: NLT 3500 theoretical plates  
 Relative standard deviation: NMT 2.0%

**Analysis**

Samples: *Standard solution* and *Sample solution*  
 Calculate the concentration ( $C_i$ ) of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result}_i = (r_u/r_s) \times C_s$$

$r_u$  = peak response from the *Sample solution*  
 $r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) dissolved at each time point ( $i$ ):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_s)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$C_i$  = concentration of alfuzosin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

$V_s$  = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See Table 6.

**Table 6**

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 30
2	6	45–65
3	12	70–90
4	20	NLT 85

The percentages of the labeled amount of alfuzosin hydrochloride dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

• **Test 7:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7*.  
 Medium: 0.01 N hydrochloric acid; 900 mL  
 Apparatus 2: 100 rpm with sinker; see *Dissolution* (711), *Figure 2a*.

Times: 1, 6, 12, and 20 h

Solution A: 500 g/L of sodium hydroxide

Solution B: 100 g/L of sodium hydroxide

Buffer: Add 5 mL of perchloric acid in 1000 mL of water. Adjust with *Solution A* to a pH of 2.5, then adjust with *Solution B* to a pH of  $3.50 \pm 0.05$ . Pass through a suitable filter of 0.45-μm pore size.

Mobile phase: Acetonitrile and *Buffer* (24:76)

Standard solution: 0.01 mg/mL of USP Alfuzosin Hydrochloride RS in *Medium*

Sample solution: Centrifuge or pass a portion of the solution under test through a suitable filter.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 4.6-mm × 5-cm; 3-μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 10 μL

Run time: NLT 1.5 times the retention time of alfuzosin

**System suitability**

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.8

Relative standard deviation: NMT 2.0%

**Analysis**

Samples: *Standard solution* and *Sample solution*

Calculate the concentration ( $C_i$ ) of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result}_i = (r_u/r_s) \times C_s$$

$r_u$  = peak response from the *Sample solution*  
 $r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ) dissolved at each time point ( $i$ ):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times (V - V_s)) + (C_1 \times V_s)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times [V - (2 \times V_s)]) + [(C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{(C_4 \times [V - (3 \times V_s)]) + [(C_3 + C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$C_i$  = concentration of alfuzosin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

$V_s$  = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See Table 7.

**Table 7**

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 25
2	6	40–60
3	12	65–85
4	20	NLT 85

The percentages of the labeled amount of alfuzosin hydrochloride dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*. (RB 1-Jun-2016)

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

## Change to read:

## • ORGANIC IMPURITIES

**Solution A, Mobile phase, Diluent, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**System suitability stock solution:** 0.4 mg/mL of USP Alfuzosin System Suitability Mixture A RS in methanol

**System suitability solution:** 0.03 mg/mL of USP Alfuzosin System Suitability Mixture A RS in *Diluent* from the *System suitability stock solution*

**Standard stock solution:** 0.15 mg/mL of USP Alfuzosin Hydrochloride RS in methanol

**Standard solution:** 0.03 mg/mL of USP Alfuzosin Hydrochloride RS in *Diluent* from the *Standard stock solution*

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.0 between alfuzosin and the furamide analog; NLT 1.0 between deacylated alfuzosin and the *N*-formyl analog, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- $r_u$  = peak response of each impurity from the *Sample solution*  
 $r_s$  = peak response of alfuzosin from the *Sample solution*  
 $C_s$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of alfuzosin hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See <sup>o</sup>Table 8.

Table 8<sup>o</sup> (RB 1-Jun-2016)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Deacylated alfuzosin <sup>a</sup>	0.46	0.40
<i>N</i> -Formyl analog <sup>b</sup>	0.50	0.30
Alfuzosin	1.0	—
Furamide analog <sup>c</sup>	1.18	— <sup>d</sup>
Any individual unspecified impurity	—	0.20
Total impurities	—	0.80

<sup>a</sup> *N*-(3-Aminopropyl)-6,7-dimethoxy-*N*²-methylquinazoline-2,4-diamine.

<sup>b</sup> *N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]formamide.

<sup>c</sup> *N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide.

<sup>d</sup> Furamide analog, a component of USP Alfuzosin System Suitability Mixture A RS, is not a specified impurity.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Protect from light and moisture. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

## • USP REFERENCE STANDARDS (11)

USP Alfuzosin Hydrochloride RS

USP Alfuzosin System Suitability Mixture A RS

Furamide analog: *N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide.

$C_{19}H_{23}N_5O_4$  385.42

Deacylated alfuzosin: *N*²-(3-Aminopropyl)-6,7-dimethoxy-*N*²-methylquinazoline-2,4-diamine.

$C_{14}H_{21}N_5O_2$  291.35

*N*-Formyl analog: *N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]formamide.

$C_{15}H_{21}N_5O_3$  319.36

## Allantoin

$C_4H_6N_4O_3$

158.12

Urea, (2,5-dioxo-4-imidazolidinyl)-;  
Allantoin [97-59-6].

## DEFINITION

Allantoin contains NLT 98.5% and NMT 101.0% of  $C_4H_6N_4O_3$ .

## IDENTIFICATION

## • A. INFRARED ABSORPTION (197K)

## • B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

(201): The  $R_f$  value of the principal spot from *Sample solution B* corresponds to that from *Standard solution A*, as described in the test for *Organic Impurities*.

## ASSAY

## • PROCEDURE

**Sample:** 120 mg

**Analysis:** Transfer the *Sample* to a 100-mL beaker, dissolve by stirring in 40 mL of water, and titrate with 0.1 M sodium hydroxide. Use a suitable electrode system (see *Titrimetry* (541)). Each mL of 0.1 M sodium hydroxide is equivalent to 15.81 mg of  $C_4H_6N_4O_3$ .

Acceptance criteria: 98.5%–101.0%

## IMPURITIES

## • RESIDUE ON IGNITION (281): NMT 0.1%

## • ORGANIC IMPURITIES

**Adsorbent:** Cellulose

**Diluent:** Methanol and water (1:1)

**Urea stock solution:** 1 mg/mL of USP Urea RS in water

**Standard solution A:** 1 mg/mL of USP Allantoin RS in *Diluent*

**Standard solution B:** 0.1 mg/mL of USP Urea RS in methanol, from *Urea stock solution*

**Standard solution C:** *Standard solution A* and *Standard solution B* (1:1)

**Sample solution A:** Transfer 0.10 g of Allantoin to a 10-mL volumetric flask, add 5 mL of water, dissolve by heating, and allow to cool. Dilute with methanol to volume. [NOTE—Use immediately after preparation.]

**Sample solution B:** Transfer 1 mL of *Sample solution A* to a 10-mL volumetric flask, and dilute with *Diluent* to volume.

**Spray reagent:** 5 mg/mL of *p*-dimethylaminobenzaldehyde in a mixture of methanol and hydrochloric acid (3:1)

**Application volume**Standard solution A: 5  $\mu$ LStandard solution B: 5  $\mu$ LStandard solution C: 5  $\mu$ LSample solution A: 10  $\mu$ LSample solution B: 5  $\mu$ L**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (60:15:25)**Analysis:** Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*. Develop the chromatogram until the solvent front has moved about 10 cm. Spray the plate with *Spray reagent*, dry in a current of hot air, and after 30 min examine under visible light.**Acceptance criteria:** Any spot from *Sample solution A*, except for the principal spot, is not more intense than the spot from *Standard solution B* (NMT 0.5%). The test is not valid unless the principal spots from *Standard solution C* are clearly separated.**SPECIFIC TESTS****• ACIDITY OR ALKALINITY****Sample solution:** 5 mg/mL in carbon dioxide-free water  
**Analysis:** To 5 mL of the *Sample solution* add 5 mL of water, 0.1 mL of methyl red TS, and 0.2 mL of 0.01 M sodium hydroxide.**Acceptance criteria:** A yellow color is observed. The solution turns red upon the addition of 0.4 mL of 0.01 M hydrochloric acid.**• LOSS ON DRYING (731):** Dry a sample at 105° to constant weight: it loses NMT 0.1% of its weight.**• REDUCING SUBSTANCES****Sample solution:** 1.0 g of Allantoin in 10 mL of water. Shake for 2 min, and filter.**Analysis:** To the *Sample solution* add 1.5 mL of 0.02 M potassium permanganate.**Acceptance criteria:** The solution remains violet for at least 10 min.**ADDITIONAL REQUIREMENTS****• USP REFERENCE STANDARDS (11)**

35	70	30

Table 1 (Continued)

Time (min)	Solution A (%)	Solution B (%)
36	90	10
46	90	10

**Diluent:** Solution A and Solution B (90:10)

**Standard stock solution:** 0.05 mg/mL each of USP Allopurinol RS, USP Allopurinol Related Compound A RS, USP Allopurinol Related Compound B RS, USP Allopurinol Related Compound C RS, USP Allopurinol Related Compound D RS, and USP Allopurinol Related Compound E RS, prepared as follows. Transfer 5 mg each of USP Allopurinol RS, USP Allopurinol Related Compound A RS, USP Allopurinol Related Compound B RS, USP Allopurinol Related Compound C RS, USP Allopurinol Related Compound D RS, and USP Allopurinol Related Compound E RS to a 100-mL volumetric flask. Add 2.0 mL of 0.1 N sodium hydroxide, and promptly sonicate with swirling for NMT 1 min to dissolve. Add 80 mL of *Diluent*, and sonicate for an additional 5 min. Dilute with *Diluent* to volume. [NOTE—This solution is stable for 48 h when stored at 8°.]

**Standard solution:** 0.5 µg/mL each of USP Allopurinol RS, USP Allopurinol Related Compound A RS, USP Allopurinol Related Compound B RS, USP Allopurinol Related Compound C RS, USP Allopurinol Related Compound D RS, and USP Allopurinol Related Compound E RS in *Diluent* from the *Standard stock solution*

**Sample solution:** 0.25 mg/mL of Allopurinol, prepared as follows. Transfer 25 mg of Allopurinol to a 100-mL volumetric flask. Add 5.0 mL of 0.1 N sodium hydroxide to dissolve, promptly sonicate with swirling for NMT 1 min, add 80 mL of *Diluent*, and sonicate for an additional 5 min. Dilute with *Diluent* to volume.

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 30°

**Flow rate:** 1.0 mL/min

**Injection volume:** 40 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—See Table 2 for relative retention times.]

#### Suitability requirements

**Resolution:** NLT 0.8 between allopurinol related compound C and allopurinol related compound B

**Tailing factor:** NMT 1.5 for the allopurinol peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentages of allopurinol related compounds A, B, C, D, and E in the portion of Allopurinol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of each individual impurity from the *Standard solution*

$C_S$  = concentration of each individual impurity in the *Standard solution* (mg/mL)

$C_U$  = concentration of Allopurinol in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Allopurinol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of allopurinol from the *Standard solution*

$C_S$  = concentration of USP Allopurinol RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Allopurinol in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Ethyl-(E/Z)-3-(2-carboxy-2-cyanoethenyl)amino-1H-pyrazole-4-carboxylate	6.5	0.2
Unspecified impurity	—	0.1
Total impurities	—	1.0

#### • LIMIT OF HYDRAZINE

[NOTE—Under the following conditions, any hydrazine present in the sample will react with benzaldehyde to form benzalazine.]

**Mobile phase:** Hexane and isopropyl alcohol (95:5)

**2 N sodium hydroxide solution:** Dissolve 8.5 g of sodium hydroxide in water, and dilute with the same solvent to 100 mL. Alternatively, a commercially available 2 N sodium hydroxide solution can be used.

**Diluent:** Methanol and 2 N sodium hydroxide solution (1:1)

**Benzaldehyde solution:** 40 mg/mL of benzaldehyde in *Diluent*. [NOTE—Prepare immediately before use.]

**Hydrazine solution:** 2.0 µg/mL of hydrazine sulfate in *Diluent*. Use sonication if necessary.

**Standard solution:** Transfer 5.0 mL of *Hydrazine solution* to a suitable flask and add 4 mL of *Benzaldehyde solution*. Mix and allow to stand for 2.5 h at room temperature. Add 5.0 mL of hexane, and shake for 1 min. Allow the layers to separate, and use the upper (hexane) layer.

**Allopurinol solution:** Dissolve 250 mg of Allopurinol in 5 mL of *Diluent*.

**Sample solution:** Transfer the *Allopurinol solution* to a suitable flask, and add 4 mL of *Benzaldehyde solution*. Mix, and allow to stand for 2.5 h at room temperature. Add 5.0 mL of hexane, and shake for 1 min. Allow the layers to separate, and use the upper (hexane) layer.

**Blank solution:** Mix 5.0 mL of *Diluent* and 4 mL of *Benzaldehyde solution*, and allow to stand for 2.5 h at room temperature. Add 5.0 mL of hexane, and shake for 1 min. Allow the layers to separate, and use the upper (hexane) layer.

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 310 nm

Column: 4.0-mm × 25-cm; 5-μm packing L10

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Sample: Standard solution

[NOTE—The relative retention times for benzalazine and benzaldehyde are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between benzalazine and benzaldehyde

Relative standard deviation: NMT 15.0% for the benzalazine peak

Analysis

Samples: Standard solution and Sample solution

Calculate the amount, in ppm, of hydrazine in the portion of Allopurinol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times F$$

 $r_U$  = peak response of benzalazine from the Sample solution

 $r_S$  = peak response of benzalazine from the Standard solution

 $C_S$  = concentration of hydrazine sulfate in the Hydrazine solution (μg/mL)

 $C_U$  = concentration of Allopurinol in the Allopurinol solution (mg/mL)

 $M_{r1}$  = molecular weight of hydrazine, 32.05

 $M_{r2}$  = molecular weight of hydrazine sulfate, 130.12

 $F$  = unit conversion factor (from μg/mg to ppm), 1000

Acceptance criteria: NMT 10 ppm of hydrazine

**SPECIFIC TESTS**• **LOSS ON DRYING** (731)

Analysis: Dry under vacuum at 105° for 5 h.

Acceptance criteria: NMT 0.5%

**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.• **USP REFERENCE STANDARDS** (11)

USP Allopurinol RS

USP Allopurinol Related Compound A RS

3-Amino-4-carboxamidopyrazole hemisulfate.

(C<sub>5</sub>H<sub>6</sub>N<sub>4</sub>O)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> 350.32

## Allopurinol Compounded Oral Suspension

**DEFINITION**

Allopurinol Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of allopurinol (C<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O).

Prepare Allopurinol Compounded Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Allopurinol tablets equivalent to	2 g of allopurinol
Glycerin	5 mL
Vehicle for Oral Suspension, <i>NF</i>	45 mL
Vehicle for Oral Solution, <i>NF</i> , a sufficient quantity to make	100 mL

Select the number of tablets that contain the specified amount of allopurinol, and calculate the quantity of each ingredient required for the total amount to be prepared. Count, weigh, or measure each ingredient. Thoroughly pulverize the tablets. Mix the powdered *Allopurinol tablets* and *Glycerin* to form a smooth paste. Incorporate the *Vehicle for Oral Suspension*. Add sufficient *Vehicle for Oral Solution* to volume, and mix well. Adjust the pH, if necessary. Package and label.

**SPECIFIC TESTS**• **pH** (791): 6.5–7.5**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Package in a tight container, and store at controlled room temperature.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded when stored at controlled room temperature
- **LABELING:** Label it to state that it is to be shaken well before use, and to state the *Beyond-Use Date*.

## Allopurinol Tablets

» Allopurinol Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of allopurinol (C<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Allopurinol RS

**Identification**—Extract a quantity of finely powdered Tablets, equivalent to about 50 mg of allopurinol, by trituration with 10 mL of 0.1 N sodium hydroxide. Filter, acidify the filtrate with 1 N acetic acid, collect the precipitated allopurinol (allow 10 to 15 minutes for sufficient precipitation to occur), wash the precipitate with 3 mL of dehydrated alcohol, in portions, and finally wash with 4 mL of anhydrous ethyl ether. Allow to dry in air for 15 minutes, then dry at 105° for 3 hours: the residue so obtained meets the requirements for the *Identification* test under *Allopurinol*.

**Dissolution** (711)—

Medium: 0.01 N hydrochloric acid; 900 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

**Standard stock solution**—Prepare a stock solution by transferring about 40 mg of USP Allopurinol RS, accurately weighed, to a 200-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, sonicate for about 2 minutes, shake by mechanical means for about 10 minutes, dilute with *Dissolution Medium* to volume, and mix.

**Standard solution**—Dilute the *Standard stock solution* with *Dissolution Medium* to obtain a solution having a concentration similar to that expected in the solution under test.

**Procedure**—Determine the amount of C<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O dissolved by employing UV absorption at the wavelength of maximum absorbance at about 250 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with the *Standard solution*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of C<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—[NOTE—Do not allow the *Mobile phase* to remain in the column overnight. After performing the procedure, flush the system with water for not less than 20 minutes, and then flush with methanol for 20 minutes.]

**Mobile phase**—Prepare a filtered and degassed 0.05 M solution of monobasic ammonium phosphate.

**Internal standard solution**—On the day of use, dissolve about 50 mg of hypoxanthine in 10 mL of 0.1 N sodium hydroxide, shake by mechanical means until dissolved (about 10 minutes), dilute with water to 50 mL, and mix.

**Standard preparation**—On the day of use, transfer about 50 mg of USP Allopurinol RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of 0.1 N sodium hydroxide, shake by mechanical means for 10 minutes, dilute with water to volume, and mix. Transfer 4.0 mL of this solution and 2.0 mL of *Internal standard solution* to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of allopurinol, to a 50-mL volumetric flask, add 10 mL of 0.1 N sodium hydroxide, shake by mechanical means for 10 minutes, add water to volume, and mix. [NOTE—From this point, conduct the remainder of the Assay without delay.] Filter, rejecting the first 10 mL of the filtrate. Transfer 4.0 mL of the filtrate and 2.0 mL of *Internal standard solution* to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for hypoxanthine and 1.0 for allopurinol; the resolution,  $R_s$ , between the analyte and internal standard is not less than 5; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of allopurinol ( $C_5H_4N_4O$ ) in the portion of Tablets taken by the formula:

$$2.5C(R_U / R_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Allopurinol RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of allopurinol to hypoxanthine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Allyl Isothiocyanate

$C_4H_5NS$

3-Isothiocyanato-1-propene;  
Isothiocyanic acid allyl ester [57-06-7].

99.15

### DEFINITION

Allyl Isothiocyanate contains NLT 93.0% and NMT 105.0% of allyl isothiocyanate ( $C_4H_5NS$ ).

[CAUTION—Allyl Isothiocyanate is a potent lachrymator, with a pungent, irritating odor. Care should be taken to protect the eyes, to prevent inhalation of fumes, and to avoid tasting.]

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197F): The spectrum exhibits pronounced peaks at about 700, 950, 980, 1300, 1340, 1350, 1410, 1420, 1650, 2100, and 2200  $cm^{-1}$ .

### ASSAY

#### PROCEDURE

**Sample solution**: Transfer 4 mL into a 100-mL volumetric flask, and dilute with alcohol to volume.

**Analysis**: Transfer 5.0 mL of the *Sample solution* to a 100-mL conical flask, and add 50.0 mL of 0.1 N silver nitrate VS and 5 mL of ammonia TS. Connect the flask to a reflux condenser, heat on a water bath for 1 h, and allow to cool to room temperature. Disconnect the flask from the condenser, transfer the contents of the conical flask to a 100-mL volumetric flask with the aid of water, and dilute with water to volume. Pass through a dry filter, discarding the first 10 mL of the filtrate. To 50.0 mL of the subsequent filtrate add 5 mL of nitric acid and 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Perform a blank determination, using 5 mL of alcohol in place of the *Sample solution*, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 4.958 mg of allyl isothiocyanate ( $C_4H_5NS$ ).

Acceptance criteria: 93.0%–105.0%

### IMPURITIES

#### LIMIT OF PHENOLS

**Sample solution**: Dilute a 1-mL sample with 5 mL of alcohol.

**Analysis**: Add 1 drop of ferric chloride TS to the *Sample solution*.

Acceptance criteria: A blue color is not produced immediately.

### SPECIFIC TESTS

- SPECIFIC GRAVITY** (841): 1.013–1.020
- REFRACTIVE INDEX** (831): 1.527–1.531, determined at 20°
- DISTILLING RANGE, Method I** (721): 148°–154°

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE**: Preserve in tight containers.

## Almotriptan Malate

$C_{17}H_{25}N_3O_2S \cdot C_4H_6O_5$

469.55

Pyrrolidine, 1-[[[3-[2-(dimethylamino)ethyl]-1H-indol-5-yl]methyl]sulfonyl]-, hydroxybutanedioate (1:1); 1-[[[3-[2-(Dimethylamino)ethyl]indol-5-yl]methyl]sulfonyl]pyrrolidine malate (1:1) [181183-52-8].

### DEFINITION

Almotriptan Malate contains NLT 98.0% and NMT 102.0% of almotriptan malate ( $C_{17}H_{25}N_3O_2S \cdot C_4H_6O_5$ ), calculated on the anhydrous and solvent-free basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Buffer:** 2.72 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

**Mobile phase:** Methanol and Buffer (40:60)

**System suitability solution:** 0.14 mg/mL each of USP Almotriptan Malate RS and USP Almotriptan Related Compound B RS in *Mobile phase*. Sonication may be used to promote dissolution.

**Standard solution:** 0.14 mg/mL of USP Almotriptan Malate RS in *Mobile phase*. Sonication may be used to promote dissolution.

**Sample solution:** 0.14 mg/mL of Almotriptan Malate in *Mobile phase*. Sonication may be used to promote dissolution.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L10

**Flow rate:** 1 mL/min

**Injection volume:** 10 μL

**Run time:** 2 times the retention time of almotriptan

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for almotriptan related compound B and almotriptan are 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.0 between almotriptan and almotriptan related compound B, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 0.85% for six injections, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of almotriptan malate ( $C_{17}H_{25}N_3O_2S \cdot C_4H_6O_5$ ) in the portion of Almotriptan Malate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of almotriptan from the *Sample solution*

$r_S$  = peak response of almotriptan from the *Standard solution*

$C_S$  = concentration of USP Almotriptan Malate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Almotriptan Malate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous and solvent-free basis

**IMPURITIES**

**• RESIDUE ON IGNITION** (281): NMT 0.10%

**• LIMIT OF ALMOTRIPTAN RELATED COMPOUND D AND ALMOTRIPTAN N-DIMER**

**Run buffer:** 23.5 g/L of phosphoric acid in water. Adjust with triethanolamine to a pH of 3.0 and pass through a suitable filter of 0.45-μm pore size.

**Diluent:** Methanol and water (50:50)

**Internal standard solution:** 0.01 mg/mL of 4-hydroxy-4-phenylpiperidine in *Diluent*

**Standard stock solution:** 0.5 mg/mL of USP Almotriptan Malate RS in *Diluent*

**Standard solution:** 0.005 mg/mL of USP Almotriptan Malate RS from *Standard stock solution* in *Internal standard solution*. Pass through a suitable filter of 0.45-μm pore size.

**System suitability solution:** 0.005 mg/mL each of USP Almotriptan Related Compound B RS, USP Almotriptan Related Compound C RS, USP Almotriptan Related Compound D RS, and USP Almotriptan Malate RS in

*Internal standard solution*. Pass through a suitable filter of 0.45-μm pore size.

**Sample solution:** 2.5 mg/mL of Almotriptan Malate in *Internal standard solution*. Sonication may be used to promote dissolution. Pass the solution through a suitable filter of 0.45-μm pore size.

**Instrumental conditions**

**Mode:** CE

**Detector:** UV 214 nm

**Capillary dimensions:** 75-μm × 47-cm; uncoated fused silica

**Separation voltage:** 15 kV

**Electrokinetic injection:** 8s + 1s, *Run buffer*

**Run time:** NLT 2.5 times the migration time of almotriptan

Pre-condition the capillary by rinsing with water, 0.1 N sodium hydroxide solution, and *Run buffer* before each injection.

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See Table 1 for the relative migration times.]

**Suitability requirements**

**Resolution:** NLT 2.0 between almotriptan related compound B and almotriptan; NLT 2.0 between almotriptan related C and almotriptan related compound D, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for the ratio of the peak response of almotriptan to the peak response of the internal standard, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the corrected peak response:

$$\text{Result} = (r/m)$$

$r$  = peak response

$m$  = migration time of the peak (min)

Calculate the percentage of almotriptan related compound D, almotriptan N-dimer, and other impurities in the portion of Almotriptan Malate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = corrected peak response ratio of the impurity to the internal standard from the *Sample solution*

$R_S$  = corrected peak response ratio of almotriptan to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Almotriptan Malate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Almotriptan Malate in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 1.

**Table 1**

Name	Relative Migration Time	Acceptance Criteria, NMT (%)
Almotriptan N-dimer <sup>a</sup>	0.71	0.3
Internal standard <sup>b</sup>	0.78	—
Almotriptan related compound B <sup>c</sup>	0.92	—
Almotriptan <sup>d</sup>	1.0	—
Almotriptan related compound C <sup>c,d</sup>	1.02	—

<sup>a</sup> 2-[(1-[(3-[2-(Dimethylamino)ethyl]-1H-indol-5-yl)methyl]-5-[(pyrrolidin-1-yl)sulfonyl)methyl]-1H-indol-3-yl)-N,N-dimethylethan-1-amine.

<sup>b</sup> 4-Hydroxy-4-phenylpiperidine.

<sup>c</sup> This impurity is quantified using the test for *Organic Impurities*.

<sup>d</sup> Almotriptan and almotriptan related compound C may not be fully resolved.

Table 1 (Continued)

Name	Relative Migration Time	Acceptance Criteria, NMT (%)
Almotriptan related compound D	1.22	0.1
Any individual unspecified impurities	—	0.1

<sup>a</sup> 2-[1-((3-[2-(Dimethylamino)ethyl]-1*H*-indol-5-yl)methyl)-5-[(pyrrolidin-1-ylsulfonyl)methyl]-1*H*-indol-3-yl)-*N,N*-dimethylethan-1-amine.

<sup>b</sup> 4-Hydroxy-4-phenylpiperidine.

<sup>c</sup> This impurity is quantified using the test for *Organic Impurities*.

<sup>d</sup> Almotriptan and almotriptan related compound C may not be fully resolved.

#### • ORGANIC IMPURITIES

**Buffer:** Add 10 mL of triethylamine to every 1000 mL of 0.01 M phosphoric acid. Adjust with phosphoric acid to a pH of 6.5.

**Mobile phase:** Acetonitrile and Buffer (15:85)

**System suitability stock solution:** 0.5 mg/mL each of USP Almotriptan Related Compound B RS, USP Almotriptan Related Compound C RS, and USP Almotriptan Related Compound D RS in methanol

**System suitability solution:** 0.005 mg/mL each of USP Almotriptan Related Compound B RS, USP Almotriptan Related Compound C RS, and USP Almotriptan Related Compound D RS from *System suitability stock solution* in water

**Standard solution:** 0.007 mg/mL of USP Almotriptan Malate RS in water

**Sample solution:** 3.5 mg/mL of Almotriptan Malate in water. Sonication may be used to promote dissolution.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 30-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 μL

**Run time:** 3 times the retention time of almotriptan

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 1.0 between almotriptan related compound C and almotriptan related compound D, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for six replicate injections, *Standard solution*

#### Analysis

**Samples:** *System suitability solution*, *Standard solution*, and *Sample solution*

Chromatograph the *System suitability solution* and identify the components on the basis of their relative retention times, as shown in Table 2.

Calculate the percentage of each impurity in the portion of Almotriptan Malate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of almotriptan from the *Standard solution*

$C_S$  = concentration of USP Almotriptan Malate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Almotriptan Malate in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Malic acid <sup>a</sup>	0.10	—
Almotriptan related compound B	0.62	0.1
Almotriptan related compound C	0.77	0.5
Almotriptan related compound D <sup>b</sup>	0.92	—
Almotriptan	1.00	—
Any other individual impurity	—	0.1
Total impurities <sup>c</sup>	—	0.7

<sup>a</sup> Included for identification purposes only.

<sup>b</sup> This impurity is quantified using the *Limit of Almotriptan Related Compound D and Almotriptan N-Dimer* test.

<sup>c</sup> The sum of all impurities from the test for *Organic Impurities* and the *Limit of Almotriptan Related Compound D and Almotriptan N-Dimer* test.

#### • LIMIT OF FUMARIC ACID

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.8.

**Mobile phase:** Methanol and Buffer (5:95)

**Standard solution:** 0.0085 mg/mL of USP Fumaric Acid RS and 0.0017 mg/mL of USP Maleic Acid RS in water. Sonication may be used to promote dissolution.

**Sample solution:** 2.8 mg/mL of Almotriptan Malate in water. Sonication may be used to promote dissolution.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L7

**Flow rate:** 0.7 mL/min

**Injection volume:** 10 μL

**Run time:** NLT 1.6 times the retention time of fumaric acid

#### System suitability

**Sample:** *Standard solution*

[NOTE—See Table 3 for relative retention times.]

#### Suitability requirements

**Resolution:** NLT 2.0 between fumaric acid and maleic acid

**Relative standard deviation:** NMT 5.0% for fumaric acid from six injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of fumaric acid (C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) in the portion of Almotriptan Malate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of fumaric acid from the *Sample solution*

$r_S$  = peak response of fumaric acid from the *Standard solution*

$C_S$  = concentration of USP Fumaric Acid RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Almotriptan Malate in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Malic acid <sup>a</sup>	0.60	—
Maleic acid <sup>a</sup>	0.80	—
Fumaric acid	1.0	0.2

<sup>a</sup>Included for identification purposes only.

## Almotriptan Tablets

### DEFINITION

Almotriptan Tablets contain an amount of almotriptan malate ( $C_{17}H_{25}N_3O_2S \cdot C_4H_4O_5$ ) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of almotriptan ( $C_{17}H_{25}N_3O_2S$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)

**Sample**: Sonicate 5 powdered Tablets in 25 mL of water. Extract the suspension with 25 mL of methylene chloride, and discard the organic phase. Add another 25 mL of methylene chloride and 3 mL of 1 N sodium hydroxide. Extract the precipitated base into the organic layer. Dry with anhydrous sodium sulfate, and evaporate the organic solvent. Prepare the residue oil as a film on a sodium chloride pellet.

**Acceptance criteria**: The IR spectrum obtained from the *Sample* is consistent with that of similarly prepared USP Almotriptan Malate RS.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

- **PROCEDURE**

Protect samples, the Reference Standards, and solutions containing them from light.

**Buffer**: Add 10 mL of triethylamine to every 1000 mL of 0.01 M phosphoric acid. Adjust with phosphoric acid to a pH of 6.0.

**Mobile phase**: Acetonitrile and *Buffer* (10:90)

**Standard solution**: 0.5 mg/mL of USP Almotriptan Malate RS in *Mobile phase*. Sonication may be used to aid in dissolution.

**System suitability stock solution**: 0.1 mg/mL each of USP Almotriptan Related Compound B RS, USP Almotriptan Related Compound C RS, and USP Almotriptan Related Compound D RS in methanol. Sonication may be used to aid in dissolution.

**System suitability solution**: 0.001 mg/mL each of USP Almotriptan Related Compound B RS, USP Almotriptan Related Compound C RS, and USP Almotriptan Related Compound D RS prepared from the *System suitability stock solution* in *Standard solution*

**Sample solution**: Nominally 0.5 mg/mL of almotriptan from Tablets prepared as follows. Transfer NLT 8 Tablets into a suitable volumetric flask, and add 80% of the flask volume of *Mobile phase*. Sonicate for NLT 10 min, and dilute with *Mobile phase* to volume. Stir for 30 min, and centrifuge. Pass a portion of the supernatant through a suitable filter of 0.45- $\mu$ m pore size. Use the filtrate.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode**: LC

**Detector**: UV 210 nm

**Column**: 2.1-mm  $\times$  10-cm; 1.8- $\mu$ m packing L1

**Column temperature**: 40°

**Flow rate**: 0.55 mL/min

**Injection volume**: 3  $\mu$ L

### System suitability

**Samples**: *Standard solution* and *System suitability solution*

[NOTE—See *Table 1* for the relative retention times.]

### Suitability requirements

**Resolution**: NLT 1.5 between almotriptan related compound C and almotriptan peaks, *System suitability solution*

**Tailing factor**: NMT 3.0, *Standard solution*

**Relative standard deviation**: NMT 2.0%, *Standard solution*

### Analysis

**Samples**: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of almotriptan ( $C_{17}H_{25}N_3O_2S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of almotriptan from the *Sample solution*

$r_S$  = peak response of almotriptan from the *Standard solution*

$C_S$  = concentration of USP Almotriptan Malate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of almotriptan in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of almotriptan, 335.46

$M_{r2}$  = molecular weight of almotriptan malate, 469.55

**Acceptance criteria**: 90.0%–110.0% of the labeled amount of almotriptan

### PERFORMANCE TESTS

- **DISSOLUTION** (711)

**Medium**: 0.1 N hydrochloric acid; 900 mL

**Apparatus 2**: 50 rpm

**Time**: 15 min

**Standard solution**: ( $L/600$ ) mg/mL of USP Almotriptan Malate RS in *Medium*, where  $L$  is the label claim in mg/Tablet

**Sample solution**: Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

**Instrumental conditions****Mode:** UV**Analytical wavelength**

For Tablets labeled to contain 6.25 mg: 228 nm

For Tablets labeled to contain 12.5 mg: 284 nm

**Blank:** Medium**Analysis****Samples:** Standard solution and Sample solutionCalculate the percentage of the labeled amount of almotriptan ( $C_{17}H_{25}N_3O_2S$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times (M_{r1}/M_{r2}) \times 100$$

 $A_U$  = absorbance of the Sample solution $A_S$  = absorbance of the Standard solution $C_S$  = concentration of USP Almotriptan Malate RS in the Standard solution (mg/mL) $L$  = label claim (mg/Tablet) $V$  = volume of Medium, 900 mL $M_{r1}$  = molecular weight of almotriptan, 335.46 $M_{r2}$  = molecular weight of almotriptan malate, 469.55**Tolerances:** NLT 80% (Q) of the labeled amount of almotriptan ( $C_{17}H_{25}N_3O_2S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES**• **ORGANIC IMPURITIES**

Mobile phase, Standard solution, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

**Analysis****Samples:** Standard solution, System suitability solution, and Sample solution

Chromatograph the System suitability solution and identify the components on the basis of their relative retention times, as shown in Table 1.

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

 $r_U$  = peak response of each degradation product from the Sample solution $r_S$  = peak response of almotriptan from the Standard solution $C_S$  = concentration of USP Almotriptan Malate RS in the Standard solution (mg/mL) $C_U$  = nominal concentration of almotriptan in the Sample solution (mg/mL) $M_{r1}$  = molecular weight of almotriptan, 335.46 $M_{r2}$  = molecular weight of almotriptan malate, 469.55**Acceptance criteria:** See Table 1.**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

 $C_{17}H_{25}N_3O_3S$  351.46**Aloe****DEFINITION**

Aloe is the dried latex of the leaves of *Aloe vera* (L.) Burm. f. (syn. *Aloe barbadensis* Mill.), known in commerce as aloe vera, Curaçao aloe, or Barbados aloe; or of *Aloe ferox* Mill., or of hybrids of *Aloe ferox* Mill. with *Aloe africana* Mill. and *Aloe spicata* L.f., known in commerce as cape aloe (Fam. Liliaceae). Aloe vera contains NLT 16.0% of aloin, and cape aloe and its hybrids contain NLT 6.0% of aloin, both calculated on the dried basis.

**IDENTIFICATION**• **A.****Sample:** 1 g finely powdered**Analysis:** Mix the Sample with 25 mL of cold water.

Shake the mixture occasionally during 2 h, filter, and wash the filter and residue with sufficient cold water to make the filtrate measure 100 mL.

**Acceptance criteria:** The color of the filtrate, viewed in the bulb of a 100-mL volumetric flask, is dark orange with curaçao aloe and greenish yellow with cape aloe. The filtrate darkens on standing. [NOTE—Reserve the filtrate for Identification test B.]• **B.****Sample:** 5 mL of the filtrate obtained in Identification test A

**Analysis:** Add 2 mL of nitric acid to the *Sample*, and mix.

**Acceptance criteria:** The mixture exhibits a reddish-orange color with aloe vera and a reddish-brown color that changes rapidly to green with cape aloe.

#### • C. THIN-LAYER CHROMATOGRAPHY

**Standard solution:** 1.0 mg/mL of USP Aloin RS in methanol

**Sample solution:** 0.5 g of finely powdered Aloe in 10 mL of methanol, sonicate for 15 min, centrifuge or filter, and use the supernatant or the filtrate.

#### Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

**Adsorbent:** Chromatographic silica gel mixture with an average particle size of 5  $\mu$ m (HPTLC plates)

**Application volume:** 2  $\mu$ L of the *Standard solution* and 5  $\mu$ L of the *Sample solution* as 8-mm bands

**Relative humidity:** Condition the plate to a relative humidity of about 33% using a suitable device.

**Developing solvent system:** Ethyl acetate, methanol, and water (100:17:13)

**Developing distance:** 6 cm

**Derivatization reagent:** 10% solution of potassium hydroxide in methanol (prepare in an ice bath)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable high performance thin-layer chromatographic plate. Use a saturated chamber. Develop the chromatograms, dry in air, derivatize with *Derivatization reagent*, and heat at 110° for 5 min. Examine under visible light and UV light at 365 nm.

**Acceptance criteria:** Under visible light, the *Sample solution* chromatogram exhibits a brown band due to aloin at about the middle of the chromatogram, corresponding in color and  $R_f$  to the band exhibited by the *Standard solution*. *Sample solution* containing aloe vera exhibits an additional violet band due to 7-hydroxyaloin right below the aloin band. *Sample solution* containing cape aloe lacks the violet band due to 7-hydroxyaloin. Under UV light at 365 nm, the *Sample solution* chromatogram exhibits a yellow fluorescence band due to aloin, corresponding in color and  $R_f$  to the band exhibited by the *Standard solution*, and a light blue fluorescence band due to aloesine at about one third of the chromatogram.

#### ASSAY

##### • CONTENT OF ALOIN

**Mobile phase:** A mixture of acetonitrile and water (3:7)

**Standard solution:** 0.1 mg/mL of USP Aloin RS in methanol and water (1:1)

**Sample solution:** Transfer about 0.1 g of aloe vera or 0.2 g of cape aloe, finely powdered and accurately weighed, to a 100-mL volumetric flask, and add about 75 mL of methanol. Sonicate for 30 min, cool to room temperature, adjust to volume using methanol, and mix. Before injection, pass through a PTFE membrane filter of 0.45- $\mu$ m pore size, discarding the first few mL of the filtrate.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 295 nm

**Column:** 4.6-mm  $\times$  25-cm; end-capped 5- $\mu$ m, packing L1

**Column temperature:** 43  $\pm$  1°

**Flow rate:** 1.0 mL/min

**Injection volume:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for the aloin peak

**Column efficiency:** NLT 2000 theoretical plates for the aloin peak

**Relative standard deviation:** NMT 2.0% determined from the aloin peak in repeated injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—*Standard solution* and *Sample solution* are stable for 8 h at room temperature.]

Using the chromatogram of *Standard solution*, identify the retention time of the peak corresponding to aloin in the *Sample solution*.

Calculate the percentage of aloin in the portion of Aloe taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

$r_U$  = peak area for aloin from the *Sample solution*

$r_S$  = peak area for aloin from the *Standard solution*

$C_S$  = concentration of USP Aloin RS in the *Standard solution* (mg/mL)

$V$  = final volume of the *Sample solution* (mL)

$W$  = weight of Aloe taken to prepare the *Sample solution* (mg)

**Acceptance criteria:** Aloe vera contains NLT 16.0% of aloin, and cape aloe and its hybrids contain NLT 6.0% of aloin, both calculated on the dried basis.

#### • WATER-SOLUBLE EXTRACTIVE

**Sample:** 2 g of powdered Aloe

**Analysis:** Macerate the *Sample* in 70 mL of water in a suitable flask. Shake the mixture during 8 h at 30-min intervals, and allow it to stand for 16 h without shaking. Filter, and wash the flask and residue with small portions of water, passing the washings through the filter until the filtrate measures 100.0 mL. Evaporate a 50-mL aliquot of the filtrate in a tared dish on a steam bath to dryness, and dry at 110° to constant weight.

**Acceptance criteria:** The weight of water-soluble extractive so obtained is NLT 50% of the weight of Aloe taken.

#### SPECIFIC TESTS

##### • LOSS ON DRYING (731)

**Sample:** Use a powdered sample. If the Aloe is not powdered, crush it in a mortar until it passes through a no. 40 sieve, and mix the ground material before weighing the sample.

**Analysis:** Dry at 105° for 5 h.

**Acceptance criteria:** NMT 12.0%

##### • ARTICLES OF BOTANICAL ORIGIN, Total Ash (561)

**Acceptance criteria:** NMT 4.0%

##### • ALCOHOL-INSOLUBLE SUBSTANCES

**Sample:** 1 g of powdered Aloe

**Analysis:** Add the *Sample* to 50 mL of alcohol in a flask. Heat the mixture to boiling, and maintain at incipient boiling for 15 min, replacing any loss due to evaporation. Remove from the heat, and shake the mixture at intervals during 1 h. Pass through a small dried and tared filter paper or a dried and tared filtering crucible, and wash the residue on the filter with alcohol until the last washing is colorless. Dry the residue at 105° to constant weight.

**Acceptance criteria:** The weight of the residue is NMT 10.0% of the weight of Aloe taken.

### BOTANIC CHARACTERISTICS

**Curaçao aloë:** Brownish black, opaque masses. Its fractured surface is uneven, waxy, and somewhat resinous.

**Cape aloë:** Dusky to dark brown irregular masses, the surfaces of which are often covered with a yellowish powder. Its fracture is smooth and glassy.

**Powdered aloë:** Yellow, yellowish brown to olive-brown in color. When mounted in olive oil, it appears as greenish-yellow to reddish-brown irregular fragments, the hues of which depend to some extent upon the thickness of the fragments.

### ADDITIONAL REQUIREMENTS

- **USP REFERENCE STANDARDS** (11)  
USP Aloin RS

## Alprazolam

$C_{17}H_{13}ClN_4$  308.76  
4H-[1,2,4]Triazolo[4,3- $\alpha$ ][1,4]benzodiazepine, 8-chloro-1-methyl-6-phenyl-;  
8-Chloro-1-methyl-6-phenyl-4H-s-triazolo[4,3- $\alpha$ ][1,4]benzodiazepine [28981-97-7].

### DEFINITION

Alprazolam contains NLT 98.0% and NMT 102.0% of  $C_{17}H_{13}ClN_4$ .

**[CAUTION]**—Care should be taken to prevent inhaling particles of Alprazolam and exposing the skin to it.]

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Diluent:** Acetonitrile and water (1:1)

**Buffer:** 1.4 g/L of monobasic potassium phosphate in water

**Mobile phase:** Acetonitrile and *Buffer* (1:1)

**Standard solution:** 25  $\mu$ g/mL of USP Alprazolam RS in *Diluent*. [NOTE—The solution is stable for 48 h at room temperature when stored in closed containers.]

**Sample solution:** 25  $\mu$ g/mL of Alprazolam in *Diluent*. Sonicate for about 1 min. [NOTE—The solution is stable for 48 h at room temperature when stored in closed containers.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 231 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alprazolam ( $C_{17}H_{13}ClN_4$ ) in the portion of Alprazolam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprazolam in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0%

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%

#### Delete the following:

- **HEAVY METALS**, *Method II* (231): 20 ppm • (Official 1-Jan-2018)

#### ORGANIC IMPURITIES

**Diluent, Buffer, Mobile phase, and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability solution:** 20  $\mu$ g/mL each of USP Alprazolam RS, USP Alprazolam Related Compound A RS, and USP 2-Amino-5-chlorobenzophenone RS in *Diluent*

**Standard solution:** 0.25  $\mu$ g/mL of USP Alprazolam RS in *Diluent*. [NOTE—When stored in closed containers, the solution is stable for 48 h at room temperature.]

**Sample solution:** 250  $\mu$ g/mL of Alprazolam in *Diluent*.

Sonicate for about 1 min. [NOTE—When stored in closed containers, the *Sample solution* is stable for 24 h at room temperature.]

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—For relative retention times, see *Table 1*.]

#### Suitability requirements

**Resolution:** NLT 2.0 between alprazolam related compound A and alprazolam, *System suitability solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Alprazolam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each impurity in the *Sample solution*

$r_S$  = peak response for alprazolam from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = concentration of Alprazolam in the *Sample solution* ( $\mu$ g/mL)

$F$  = relative response factor (see *Table 1*)

**Acceptance criteria:** See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Alprazolam related compound A	0.8	0.76	0.15
Alprazolam	1.0	1.0	—
2-Amino-5-chlorobenzophenone	4.0	1.0	0.15
Individual unspecified impurity	—	1.0	0.10
Total impurities	—	—	1.0

**SPECIFIC TESTS**

- **LOSS ON DRYING (731):** Dry a sample at 105° for 1 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**

## Alprazolam Compounded Oral Suspension

**DEFINITION**

Alprazolam Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>).

Prepare Alprazolam Compounded Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations (795)*).

Alprazolam	100 mg
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

Commingle tablets in a suitable mortar to a fine powder, or add *Alprazolam* powder. Add about 20 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle* to bring to final volume, and mix well.

**ASSAY**• **PROCEDURE**

**Buffer:** 0.04 M sodium acetate solution. Adjust with glacial acetic acid to a pH of 2.4.

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (45:8:47)

**Standard solution:** 20 µg/mL of USP Alprazolam RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Dilute a suitable vol-

ume of the Oral Suspension in *Mobile phase* to obtain a nominal concentration of 20 µg/mL.

**Chromatographic system**

(See *Chromatography (621)*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 0.6 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention time of alprazolam is about 10 min.]

**Suitability requirements**

**Relative standard deviation:** NMT 1.4% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of alprazolam in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- **pH (791):** 4.0–5.0

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a refrigerator.
- **BEYOND-USE DATE:** NMT 60 days after the day on which it was compounded when stored at controlled room temperature or in a refrigerator
- **LABELING:** Label it to state that it is to be well-shaken before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS (11)**  
USP Alprazolam RS

## Alprazolam Tablets

**DEFINITION**

Alprazolam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>).

**IDENTIFICATION**• **A. INFRARED ABSORPTION**

**Sample:** An amount of finely powdered Tablets, equivalent to 15 mg of alprazolam, prepared as follows. Dissolve the *Sample* in 10 mL of 10 mg/mL of sodium carbonate solution. Add 15 mL of chloroform, and shake vigorously for 30 min. Centrifuge, withdraw the aqueous layer, and transfer the chloroform to a clean container. Add 200 mg of potassium bromide. Evaporate the chloroform from this mixture to dryness, and dry the dispersion in vacuum at 60° for 24 h. Grind this dispersion into a fine powder. Prepare a suitable pellet for testing by placing 100 mg of dried potassium bromide into a die. Sprinkle 20 mg of the finely ground alprazolam–potassium bromide dispersion onto the dried potassium bromide layer, and cover with another specimen of 100 mg of dried potassium bromide.

**Acceptance criteria:** The IR absorption spectrum of the potassium bromide dispersion so obtained exhibits

maxima characteristic of alprazolam, as compared to that of a similar preparation of USP Alprazolam RS, at the following wavenumbers: at 1609, 1578, 1566, 1539, 1487, and 1379 wavenumbers in the region of 1650–1300  $\text{cm}^{-1}$ ; at 932, 891, 826, 779, 746, 696, and 658 wavenumbers in the region of 975–600  $\text{cm}^{-1}$ .

## ASSAY

### PROCEDURE

**Mobile phase:** Acetonitrile, chloroform, butyl alcohol, glacial acetic acid, and water (850:80:50:0.5:20)

**Internal standard solution:** 0.25 mg/mL of triazolam in acetonitrile

**Standard stock solution:** 0.25 mg/mL of USP Alprazolam RS in *Internal standard solution*

**Standard solution:** 25  $\mu\text{g/mL}$  of USP Alprazolam RS from *Standard stock solution* in acetonitrile

**Sample solution:** Nominally 25  $\mu\text{g/mL}$  of alprazolam from finely powdered Tablets (NLT 20) prepared as follows. Transfer a suitable amount of the powdered tablets to a suitable volumetric flask. Add 1% of the flask volume of water. Transfer 10% of the flask volume of *Internal standard solution*, shake vigorously for 10 min, and dilute with acetonitrile to volume.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  30-cm; packing L3

**Flow rate:** 2 mL/min

**Injection size:** 20  $\mu\text{L}$

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Resolution:** NLT 2.0 between triazolam and alprazolam

**Relative standard deviation:** NMT 2.0% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Sample solution*

$R_S$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of alprazolam in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### DISSOLUTION, Procedure for a Pooled Sample (711)

**Buffer stock solution:** Dissolve 80 g of monobasic potassium phosphate and 20 g of dibasic potassium phosphate in 1 L of water. Add, with mixing, phosphoric acid or potassium hydroxide solution (45 in 100), as necessary to adjust the solution, such that the resulting solution has a pH of  $6.0 \pm 0.1$ .

**Buffer:** Prepare a 1-in-10 dilution of the *Buffer stock solution* to obtain a solution that has a pH of  $6.0 \pm 0.1$ .

**Medium:** *Buffer*; 500 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Buffer* (35:5:60)

**Standard stock solution:** 0.05 mg/mL of USP Alprazolam RS in methanol

**Standard solution:** Add 50 mL of *Buffer stock solution* and 250 mL of water to a 500-mL flask. Add to the flask 5.0 mL of *Standard stock solution* for every 0.25 mg of alprazolam contained in the Tablet being assayed. Dilute with water to volume.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  10-cm; packing L7

**Flow rate:** 1 mL/min

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 500 theoretical plates

**Relative standard deviation:** NMT 3.0% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of labeled amount of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) dissolved.

**Tolerances:** NLT 80% (Q) of the labeled amount of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) is dissolved.

### UNIFORMITY OF DOSAGE UNITS (905)

**Mobile phase, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Internal standard solution:** 0.032 mg/mL of triazolam in acetonitrile

**Standard solution:** 0.025 mg/mL of USP Alprazolam RS in *Internal standard solution*

**Sample solution:** Transfer 1 Tablet to a container. Add 0.4 mL of water directly onto the Tablet, allow the Tablet to stand for 2 min, and then swirl the container to disperse the Tablet. For every 0.25 mg of alprazolam contained in the Tablet, add 10.0 mL of *Internal standard solution* to the container. Shake, and centrifuge if necessary.

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) in the Tablet taken:

$$\text{Result} = (R_U/R_S) \times C \times V \times (100/L)$$

$R_U$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Sample solution*

$R_S$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Standard solution*

$C$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$V$  = volume of *Internal standard solution* used to prepare the *Sample solution* (mL)

$L$  = label claim (mg/Tablet)

**Acceptance criteria:** Meet the requirements

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS (11)**

USP Alprazolam RS

## Alprazolam Extended-Release Tablets

### DEFINITION

Alprazolam Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### Add the following:

- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.  $\Delta_{USP40}$

### ASSAY

### Change to read:

#### • PROCEDURE

**Mobile phase:** Acetonitrile, water, and phosphoric acid (350:650:1)

**Standard solution:** 0.05 mg/mL of USP Alprazolam RS in methanol

**Sample solution:** Nominally 0.05 mg/mL of alprazolam prepared as follows. Transfer an appropriate number of Tablets to a suitable volumetric flask. Sonicate in 80% of the flask volume of methanol for 15 min, and shake mechanically for 30 min. Dilute with methanol to final volume, filter a portion of the solution, and discard the first 3 mL of filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm.  $\Delta$ For Identification B, use a diode array detector in the range of 200–400 nm.  $\Delta_{USP40}$

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Column efficiency:** NLT 3000 theoretical plates

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of alprazolam in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

### Change to read:

#### • DISSOLUTION (711)

##### Test 1

**Medium:** pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic po-

tassium phosphate in water. Adjust with phosphoric acid or potassium hydroxide to a pH of  $6.0 \pm 0.1$ ); 500 mL

**Apparatus 1:** 100 rpm

**Times:** 1, 4, 8, and 12 h

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Medium* (7:1:12)

**Standard stock solution:** 0.5 mg/mL of USP Alprazolam RS in acetonitrile

**Standard solution:** (L/500) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  10-cm; 5- $\mu$ m packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Column efficiency:** NLT 3000 theoretical plates

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 500 mL

**Tolerances:** See *Table 1*.

Table 1

Time (h)	Amount Dissolved		
	0.5-mg Tablet (%)	2-mg Tablet (%)	3-mg Tablet (%)
1	NMT 25	NMT 20	NMT 20
4	40–60	30–55	30–55
8	70–90	65–90	65–90
12	NLT 85	NLT 85	NLT 85

The percentages of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) released at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid or potassium hydroxide to a pH of  $6.0 \pm 0.1$ ); 500 mL

**Apparatus 1:** 100 rpm

**Times:** 1, 4, 8, and 16 h

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Medium* (35:5:60)

**Standard stock solution:** 0.05 mg/mL of USP Alprazolam RS in methanol

**Standard solution:** (L/500) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4.6-mm × 7.5-cm; 5-μm packing L7**Flow rate:** 1.3 mL/min**Injection volume:** 80 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 1.5**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the concentration ( $C_i$ ) of alprazolam ( $C_{17}H_{13}ClN_4$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

The percentages of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) released at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

**Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium:** pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid or potassium hydroxide to a pH of 6.0); 500 mL

**Apparatus 1** (20-mesh basket): 100 rpm

**Times:** 1, 4, 8, and 16 h

**Mobile phase:** Acetonitrile and *Medium* (32:68)

**Standard stock solution:** 0.4 mg/mL of USP Alprazolam RS in methanol

**Standard solution:** ( $L/500$ ) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where  $L$  is the label claim in mg/Tablet. Pass through a suitable filter of 0.45- $\mu$ m pore size, and use the filtrate.

**Sample solution:** At the end of specified time intervals, withdraw a known volume ( $V_s$ ) of the solution from the dissolution vessel, and replace an equal volume of fresh *Medium* into the dissolution vessel. Pass the withdrawn sample through a suitable filter of 0.45- $\mu$ m pore size, and use the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration ( $C_i$ ) of alprazolam ( $C_{17}H_{13}ClN_4$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result}_i = (r_u/r_s) \times C_s$$

$r_u$  = peak response of alprazolam from the *Sample solution* at each time point

$r_s$  = peak response of alprazolam from the *Standard solution*

$C_s$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) dissolved at each time point ( $i$ ):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_s)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times V] + [(C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times V] + [(C_3 + C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

$C_i$  = concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

$V$  = volume of *Medium*, 500 mL

$L$  = label claim (mg/Tablet)

$V_s$  = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

**Tolerances:** See *Table 4*.

**Table 4**

Time Point (i)	Time (h)	Amount Dissolved			
		0.5-mg Tablet (%)	1-mg Tablet (%)	2-mg Tablet (%)	3-mg Tablet (%)
1	1	NMT 40	NMT 35	NMT 35	NMT 35
2	4	50–75	45–65	35–55	30–55
3	8	NLT 75	70–90	55–75	50–70
4	16	NLT 85	NLT 85	NLT 85	NLT 75

The percentages of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) released at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

**Test 5:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

**Medium:** pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 6.0); 500 mL

**Apparatus 1:** 100 rpm

**Times:** 1, 4, 8, and 16 h

**Mobile phase:** Acetonitrile, water, and phosphoric acid (350:650:1)

**Standard stock solution:** 0.5 mg/mL of USP Alprazolam RS in methanol

**Standard solution:** ( $L/500$ ) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where  $L$  is the label claim in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size, and use the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection volume:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration ( $C_i$ ) of alprazolam ( $C_{17}H_{13}ClN_4$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result}_i = (r_u/r_s) \times C_s$$

$r_u$  = peak response of alprazolam from the *Sample solution* at each time point

$r_s$  = peak response of alprazolam from the *Standard solution*

$C_s$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times (V - V_s)) + (C_1 \times V_s)] \times (1/L) \times 100$$

$$\text{Result}_3 = ((C_3 \times [V - (2 \times V_s)]) + [(C_2 + C_1) \times V_s]) \times (1/L) \times 100$$

$$\text{Result}_4 = ((C_4 \times [V - (3 \times V_s)]) + [(C_3 + C_2 + C_1) \times V_s]) \times (1/L) \times 100$$

$C_i$  = concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

$V$  = volume of *Medium*, 500 mL

$L$  = label claim (mg/Tablet)

$V_s$  = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See *Table 5*.

**Table 5**

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 25
2	4	40–65
3	8	65–95
4	16	NLT 85

The percentages of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) released at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

## IMPURITIES

### • ORGANIC IMPURITIES

**Buffer:** 5.4 g/L of monobasic potassium phosphate ( $KH_2PO_4$ ) in water. Adjust with phosphoric acid to a pH of 3.4.

**Solution A:** Acetonitrile, methanol, and *Buffer* (27:10:63)

**Solution B:** Acetonitrile, methanol, and *Buffer* (7:3:10)

**Mobile phase:** See *Table 6*.

**Table 6**

Time (min)	Solution A (%)	Solution B (%)
0	95	5
22	95	5
25	15	85
60	15	85
60.1	95	5
70	95	5

**System suitability solution:** 1 µg/mL each of USP Chlordiazepoxide Related Compound A RS, USP Alprazolam Related Compound A RS, and USP Nordazepam RS; and 0.4 µg/mL of USP Alprazolam RS in methanol

**Standard solution:** 0.4 µg/mL of USP Alprazolam RS in methanol

**Sample solution:** From NLT 20 Tablets ground to a fine powder, transfer an amount of powder to a suitable flask to obtain a nominal concentration of 0.2 mg/mL of alprazolam in methanol. [NOTE—Sonicate for 15 min to dissolve the contents.] Filter a portion, and discard the first 1 mL of filtrate.

## Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L7

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 µL

## System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times are listed in *Table 7*.]

## Suitability requirements

**Resolution:** NLT 1.5 between nordazepam and alprazolam; NLT 1.5 between chlordiazepoxide related compound A and alprazolam related compound A, *System suitability solution*

**Tailing factor:** NMT 2.0 for the alprazolam peak, *System suitability solution*

**Relative standard deviation:** NMT 5%, *Standard solution*

## Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

$r_u$  = peak response of the impurity from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of alprazolam in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 7*)

**Acceptance criteria:** See *Table 7*.

**Table 7**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Chlordiazepoxide related compound A <sup>a</sup>	0.36	1.0	0.2
Alprazolam related compound A	0.45	0.7	0.5
Nordazepam <sup>a,b</sup>	0.8	1.0	0.2
Alprazolam	1.0	—	—
2-Amino-5-chloro-benzophenone	1.8	0.9	0.5
Amino-derivative <sup>c</sup>	2.2	1.2	0.5
Any other individual degradation product	—	1.0	0.2
Total impurities	—	—	2.0

<sup>a</sup> If possible from the manufacturing process.

<sup>b</sup> 7-Chloro-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one.

<sup>c</sup> 7-Chloro-1-methyl-5-phenyl[1,2,4]triazolo[4,3-a]quinolin-4-amine.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

- **LABELING:** The labeling states the *Dissolution* test used only if *Test 1* is not used.

**Change to read:**• **USP REFERENCE STANDARDS (11)**

- USP Alprazolam RS

- USP Nordazepam RS

## Alprazolam Orally Disintegrating Tablets

**DEFINITION**

Alprazolam Orally Disintegrating Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ).

**IDENTIFICATION****Change to read:**

- $\Delta_{USP40}$  The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**Add the following:**

- $\Delta_{USP40}$  **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.  $\Delta_{USP40}$

**ASSAY****Change to read:**• **PROCEDURE**

- Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.
- Diluent:** Acetonitrile and water (60:40)
- Mobile phase:** Acetonitrile, methanol, and *Buffer* (35:10:55)
- Standard solution:** 10  $\mu$ g/mL of USP Alprazolam RS in *Diluent*
- Sample solution:** Nominally 10  $\mu$ g/mL of alprazolam from Tablets prepared as follows. Transfer 10 Tablets to a suitable volumetric flask. Add *Diluent* to volume and pass through a suitable filter. [NOTE—Sonicate with intermittent shaking to help dissolve, if necessary.]
- Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)
- Mode:** LC
- Detector:** UV 221 nm.  $\Delta$ For *Identification B*, use a diode array detector in the range of 200–400 nm.  $\Delta_{USP40}$

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection volume:** 30  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of alprazolam in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**• **DISINTEGRATION (701)**

**Test 1**

**Time:** NMT 60 s

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Disintegration Test 2*.

**Time:** NMT 30 s

**Change to read:**• **DISSOLUTION (711)**

**Test 1**

**Medium:** pH 6.0 phosphate buffer (8 g/L of monobasic potassium phosphate and 2 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid or diluted potassium hydroxide to a pH of  $6.0 \pm 0.1$ ); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 10 min

**Mobile phase, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*, except use an *Injection volume* of 100  $\mu$ L.

**Standard stock solution:**  $\Delta$ 0.05 mg/mL  $\Delta_{USP40}$  of USP Alprazolam RS in methanol. [NOTE—Sonicate to help dissolve, if necessary.]

**Standard solution:**  $\Delta$ (L/1000) mg/mL  $\Delta_{USP40}$  of USP Alprazolam RS  $\Delta$ from the *Standard stock solution* in *Medium*,  $\Delta_{USP40}$  where L is the label claim in  $\Delta$ mg/ *Tablet*,  $\Delta_{USP40}$

**Sample solution:** Pass a portion of the solution under test through a nylon membrane filter of 0.45- $\mu$ m pore size, discarding the first few mL.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/ *Tablet*)

**Tolerances:** NLT 80% (Q) of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** pH 6.0 phosphate buffer (8 g/L of monobasic potassium phosphate and 2 g/L of dibasic potas-

sium phosphate in water. Adjust with phosphoric acid or potassium hydroxide to a pH of  $6.0 \pm 0.1$ ; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 10 min

**Buffer:** 1.36 g/L of monobasic potassium phosphate.

Adjust with dilute sodium hydroxide to a pH of 6.0.

**Mobile phase:** Acetonitrile and Buffer (35:65)

**Standard stock solution:**  $\Delta 0.05$  mg/mL<sub>USP40</sub> of USP Alprazolam RS in methanol. [NOTE—Sonicate to help dissolve, if necessary.]

**Standard solution:**  $\Delta(L/500)$  mg/mL<sub>USP40</sub> of USP Alprazolam RS  $\Delta$ from the *Standard stock solution* in *Medium*<sub>USP40</sub> where *L* is the label claim in  $\Delta$ mg/*Tablet*<sub>USP40</sub>

**Sample solution:** Pass a 5-mL aliquot of the solution under test through a suitable filter of 0.45- $\mu$ m pore size, discarding the first 3 mL.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  7.5-cm; 5- $\mu$ m packing L7

**Flow rate:** 1.5 mL/min

**Injection volume:** 40  $\mu$ L

**Run time:** 3 times the retention time of alprazolam

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 500 mL

$L$  = label claim (mg/*Tablet*)

**Tolerances:** NLT 70% (Q) of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Diluent:** Prepare as directed in the *Assay*.

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.

**Solution A:** Acetonitrile, methanol, and Buffer (25:20:55)

**Solution B:** Acetonitrile, methanol, and Buffer (40:5:55)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
12	100	0
15	0	100
60	0	100
65	100	0
70	100	0

**Standard solution:** 0.6  $\mu$ g/mL of USP Alprazolam RS in *Diluent*

**Sample solution:** Nominally 200  $\mu$ g/mL of alprazolam in *Diluent*. Prepare using 10 *Tablets*, and pass through a suitable filter.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 30°

**Flow rate:** 1.2 mL/min

**Injection volume:** 25  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Theoretical plates:** NLT 2000

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 6.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of *Tablets* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of alprazolam from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of alprazolam in the *Sample solution* ( $\mu$ g/mL)

$F$  = relative response factor (see *Table 2*)

**Acceptance criteria:** See *Table 2*. Disregard any peaks less than 0.05%.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Alprazolam related compound A <sup>a,b</sup>	0.8	—	—
Alprazolam	1.0	—	—
2-Amino-5-chlorobenzophenone	2.9	1.9	0.5
Any other unknown impurity	—	1.0	0.5
Total impurities	—	—	2.0

<sup>a</sup> 2-(2-Acetylhydrazino)-7-chloro-5-phenyl-3H-1,4-benzodiazepine.

<sup>b</sup> Disregard the peak due to alprazolam related compound A, because it is a process impurity in alprazolam.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** When more than one *Disintegration* test is given, the labeling states the *Disintegration* test used only if *Test 1* is not used. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**  
USP Alprazolam RS

## Alprostadil

$C_{20}H_{34}O_5$

354.48

Prost-13-en-1-oic acid, 11,15-dihydroxy-9-oxo-, (11 $\alpha$ ,13E,15S)-;  
(1R,2R,3R)-3-Hydroxy-2-[(E)-(3S)-3-hydroxy-1-octenyl]-5-oxocyclopentaneheptanoic acid [745-65-3].

## DEFINITION

Alprostadil contains NLT 95.0% and NMT 105.0% of alprostadil (C<sub>20</sub>H<sub>34</sub>O<sub>5</sub>), calculated on the anhydrous basis.

**[CAUTION]**—Great care should be taken to prevent inhaling particles of Alprostadil and exposing the skin to it.]

## IDENTIFICATION

### • A. INFRARED ABSORPTION (197M)

## ASSAY

### • PROCEDURE

Use freshly prepared solutions.

**Mobile phase:** Methanol, acetonitrile, and 0.1 M monobasic potassium phosphate (2:1:2). Adjust with phosphoric acid to a pH of 3.0.

**Diluent:** Methanol and water (90:10)

**Internal standard solution:** 0.05 mg/mL of ethylparaben in *Diluent*

**Standard stock solution:** 0.3 mg/mL of USP Alprostadil RS in *Diluent*

**Standard solution:** 0.2 mg/mL of USP Alprostadil RS prepared by combining 2.0 mL of *Standard stock solution* with 1.0 mL of *Internal standard solution*

**System suitability stock solution:** 4.5  $\mu$ g/mL of USP Prostaglandin A<sub>1</sub> RS in *Standard solution*

**System suitability solution:** Combine 2.0 mL of *System suitability stock solution* with 1.0 mL of *Internal standard solution*.

**Sample stock solution:** 0.3 mg/mL of Alprostadil in *Diluent*

**Sample solution:** 0.2 mg/mL of Alprostadil prepared by combining 2.0 mL of *Sample stock solution* and 1.0 mL of *Internal standard solution*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Photodiode array detector or equivalent capable of detecting UV wavelengths of 200–300 nm

**Analytical wavelength:** 200 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu$ L

### System suitability

**Sample:** *System suitability solution*

### Suitability requirements

**Resolution:** NLT 7.5 between prostaglandin A<sub>1</sub> and alprostadil, and NLT 2.0 between prostaglandin A<sub>1</sub> and ethylparaben

**Relative standard deviation:** NMT 2.0%, determined from the peak area ratio of alprostadil to ethylparaben

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alprostadil (C<sub>20</sub>H<sub>34</sub>O<sub>5</sub>) in the portion of Alprostadil taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak area ratio of alprostadil to the internal standard from the *Sample solution*

$R_S$  = peak area ratio of alprostadil to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Alprostadil RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprostadil in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–105.0% on the anhydrous basis

## IMPURITIES

### • RESIDUE ON IGNITION (281)

**Sample:** 0.3 g

**Acceptance criteria:** NMT 0.5%

### • LIMIT OF CHROMIUM

**Standard stock solution:** 3.04  $\mu$ g/mL of chromium trichloride in 0.05 M nitric acid

**Standard solution:** 20 ng/mL of chromium (Cr) in alcohol, prepared as follows. Transfer 2 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with alcohol to volume.

**Sample solution:** 1.0 mg/mL of Alprostadil in alcohol

**Blank:** Alcohol

### Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

**Mode:** Atomic absorption spectroscopy

**Lamp:** Chromium hollow-cathode

**Analytical wavelength:** 357.9 nm

**Atomization type:** Graphite furnace

### Temperatures

**Drying:** 100°

**Ashing:** 1000°

**Atomization:** 2700°

**Injection volume:** 20  $\mu$ L

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of chromium (Cr) in the portion of Alprostadil taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of chromium in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprostadil in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.002%

### • LIMIT OF RHODIUM

**Standard stock solution:** 100  $\mu$ g/mL of rhodium in 1.2 M hydrochloric acid, prepared by diluting rhodium chloride hydrate

**Standard solution:** 50 ng/mL of rhodium (Rh) in alcohol from *Standard stock solution*

**Sample solution:** 2.0 mg/mL of Alprostadil in alcohol

**Blank:** Alcohol

### Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

**Mode:** Atomic absorption spectroscopy

**Lamp:** Rhodium hollow-cathode

**Analytical wavelength:** 343.5 nm

**Atomization type:** Graphite furnace

### Temperatures

**Drying:** 100°

**Ashing:** 1000°

**Atomization:** 2800°

**Injection volume:** 20  $\mu$ L

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of rhodium (Rh) in the portion of Alprostadil taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of rhodium in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprostadil in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.002%

### • LIMIT OF FOREIGN PROSTAGLANDINS, TEST 1

Use freshly prepared solutions.

**Mobile phase:** Methanol, acetonitrile, and 0.1 M monobasic potassium phosphate (2:1:2). Adjust with phosphoric acid to a pH of 3.0.

**Diluent:** Methanol and water (90:10)

**Standard solution:** 6 µg/mL of USP Alprostadil RS, 15 µg/mL of USP Prostaglandin A<sub>1</sub> RS, and 6 µg/mL of USP Prostaglandin B<sub>1</sub> RS in *Diluent*

**Sample solution:** 3.0 mg/mL of Alprostadil in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Photodiode array detector or equivalent capable of detecting UV wavelengths of 200–300 nm

**Analytical wavelengths**

Prostaglandin A<sub>1</sub>: 224 nm

Prostaglandin B<sub>1</sub>: 280 nm

Other foreign prostaglandins: 200 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 7.5 between prostaglandin A<sub>1</sub> and alprostadil

**Relative standard deviation:** NMT 4.0%, determined from the peaks at their respective wavelength for replicate injections

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of prostaglandin A<sub>1</sub> and prostaglandin B<sub>1</sub> in the portion of Alprostadil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of prostaglandin A<sub>1</sub> or prostaglandin B<sub>1</sub> from the *Sample solution*

$r_S$  = peak response of prostaglandin A<sub>1</sub> or prostaglandin B<sub>1</sub> from the *Standard solution*

$C_S$  = concentration of USP Prostaglandin A<sub>1</sub> RS or USP Prostaglandin B<sub>1</sub> RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprostadil in the *Sample solution* (mg/mL)

Calculate the percentage of each impurity occurring at 200 nm and eluting before prostaglandin A<sub>1</sub> in the portion of Alprostadil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response for alprostadil from the *Standard solution*

$C_S$  = concentration of USP Alprostadil RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprostadil in the *Sample solution* (mg/mL)

Calculate the percentage of the impurity having a relative retention time of 0.6, relative to the prostaglandin A<sub>1</sub> peak detected at 224 nm, in the portion of Alprostadil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for any impurity having a relative retention time of 0.6, relative to the prostaglandin A<sub>1</sub> peak, from the *Sample solution*

$r_S$  = peak response for prostaglandin A<sub>1</sub> from the *Standard solution*

$C_S$  = concentration of USP Prostaglandin A<sub>1</sub> RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprostadil in the *Sample solution* (mg/mL)

#### Acceptance criteria

Prostaglandin A<sub>1</sub>: NMT 1.5%

Prostaglandin B<sub>1</sub>: NMT 0.1%

Any foreign prostaglandin impurity eluting before prostaglandin A<sub>1</sub>: NMT 0.9%

Impurity at relative retention time 0.6, relative to prostaglandin A<sub>1</sub>: NMT 0.9%

#### • LIMIT OF FOREIGN PROSTAGLANDINS, TEST 2

**Mobile phase:** Methanol, acetonitrile, and 0.02 M monobasic potassium phosphate (2:1:1). Adjust with phosphoric acid to a pH of 3.

**System suitability solution:** 6 µg/mL of USP Alprostadil RS, 15 µg/mL of USP Prostaglandin A<sub>1</sub> RS, and 6 µg/mL of USP Prostaglandin B<sub>1</sub> RS in methanol and water (9:1)

**Standard solution:** 10 µg/mL of USP Alprostadil RS in acetonitrile and water (1:1)

**Sample solution:** 5.0 mg/mL of Alprostadil in acetonitrile and water (1:1). [NOTE—Sonicate if necessary.]

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Photodiode array detector or equivalent, capable of detecting UV wavelengths of 200–300 nm

**Analytical wavelengths**

Prostaglandin A<sub>1</sub>: 224 nm

Prostaglandin B<sub>1</sub>: 280 nm

Other foreign prostaglandins: 200 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 20 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for alprostadil and prostaglandin A<sub>1</sub> are 1.0 and 1.2, respectively, *System suitability solution*.]

**Suitability requirements**

**Resolution:** NLT 4.0 between prostaglandin A<sub>1</sub> and alprostadil, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, determined from the main peak, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity, excluding prostaglandin B<sub>1</sub>, observed at 200 nm and eluting after prostaglandin A<sub>1</sub> in the portion of Alprostadil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response for alprostadil from the *Standard solution*

$C_S$  = concentration of USP Alprostadil RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprostadil in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Sum of the impurities at relative retention times 2.0 and 2.3:** NMT 0.6%

**Any other foreign prostaglandin impurity eluting after prostaglandin A<sub>1</sub>:** NMT 0.9%

**Total impurities:** The sum of the impurities from *Limit of Foreign Prostaglandins, Test 1* and *Test 2*, is NMT 2.0%.

#### SPECIFIC TESTS

##### • WATER DETERMINATION, Method I (921)

**Sample:** 0.5 g

**Acceptance criteria:** NMT 0.5%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a refrigerator.

• **USP REFERENCE STANDARDS (11)**

USP Alprostadil RS  
USP Prostaglandin A<sub>1</sub> RS  
USP Prostaglandin B<sub>1</sub> RS  
(13E,15S)-15-Hydroxy-9-oxoprostano-8(12),13-dien-1-oic acid.  
C<sub>20</sub>H<sub>32</sub>O<sub>4</sub> 336.47

## Alprostadil Injection

### DEFINITION

Alprostadil Injection is a sterile solution of Alprostadil in Dehydrated Alcohol. It contains NLT 90.0% and NMT 115.0% of the labeled amount of alprostadil (C<sub>20</sub>H<sub>34</sub>O<sub>5</sub>).

### IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

**Sample:** Dry an amount of Injection, equivalent to 2 mg of alprostadil, on 500 mg of spectroscopic grade potassium bromide at 40°–50° under vacuum. Prepare a pellet from this mixture.

**Standard:** A solution of USP Alprostadil RS dissolved in dehydrated alcohol and processed as described in the *Sample*

**Acceptance criteria:** Meets the requirements

### ASSAY

• **PROCEDURE**

**Solution A:** 40 mg/mL of α-bromo-2'-acetonaphthone in acetonitrile, freshly prepared

**Solution B:** 5 mg/mL of diisopropylethylamine in acetonitrile, freshly prepared

**Mobile phase:** Methylene chloride, 1,3-butanediol, and water (1000:6:0.5)

**Internal standard solution:** 50 µg/mL of ethylparaben in methylene chloride

**Standard stock solution:** 0.5 mg/mL of USP Alprostadil RS in dehydrated alcohol

**Standard solution:** 0.13 mg/mL of USP Alprostadil RS, prepared as follows. Gently evaporate a 0.5-mL portion of the *Standard stock solution* to dryness with a stream of nitrogen. Add 150 µL of *Solution A*, rinse the inside of the container with this solution, and swirl. Add 150 µL of *Solution B* to the container, rinse the inside of the container with this solution, and swirl. Cap and sonicate to dissolve. Heat the container at 45° for 45 min, swirling occasionally. Sonicate again after heating is complete. Discard the specimen if the entire sample does not dissolve. Evaporate the solution using a stream of nitrogen, add 2.0 mL of *Internal standard solution*, and sonicate to dissolve. Discard the specimen if the entire sample does not dissolve.

**Sample solution:** Nominally 0.13 mg/mL of alprostadil, prepared as follows. Pool the contents of several containers of the Injection. Gently evaporate a volume, equivalent to 0.25 mg of alprostadil, to dryness using a stream of nitrogen. Proceed as directed for the *Standard solution*, beginning with "Add 150 µL of *Solution A*".

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.4-mm × 25-cm; packing L18

**Flow rate:** 1.5 mL/min

**Injection volume:** Equal volumes of *Standard solution* and *Sample solution*

### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for ethylparaben and alprostadil are about 0.4 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 9.0 between alprostadil and the internal standard

**Relative standard deviation:** NMT 2.5%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprostadil (C<sub>20</sub>H<sub>34</sub>O<sub>5</sub>) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of alprostadil to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of alprostadil to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Alprostadil RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of alprostadil the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–115.0%

### SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 5 USP Endotoxin Units/100 µg of alprostadil.

• **STERILITY TESTS (71):** It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

• **WATER DETERMINATION, Method I (921):** NMT 0.4%

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, single-dose containers, preferably of Type I glass. Store in a refrigerator.

• **USP REFERENCE STANDARDS (11)**

USP Alprostadil RS  
USP Endotoxin RS

### DEFINITION

Alteplase is a highly purified glycosylated serine protease with fibrin-binding properties and plasminogen-specific proteolytic activities. It is produced by recombinant DNA synthesis in mammalian cell culture. It has a biological potency of NLT 90.0% and NMT 115.0% of the potency stated on the label, the potency being 580,000 USP Alteplase Units/mg of protein.

The presence of host cell DNA and host cell protein impurities in Alteplase is process specific; the limits of these impurities are determined by validated methods.

## IDENTIFICATION

### A.

**Standard solution:** 1.0–2.5 mg/mL of USP Alteplase RS

**Sample solution:** Prepare similarly to the *Standard solution*.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

To each of three test tubes transfer 1 mL of 0.5-mg/mL H-D-isoleucyl-prolyl-arginyl-*p*-nitroaniline dihydrochloride. Separately transfer 200  $\mu$ L of the *Standard solution* and 200  $\mu$ L of the *Sample solution* to two of the test tubes. To the third test tube add 200  $\mu$ L of 0.2 M arginine solution that has been adjusted with phosphoric acid to a pH of 7.3 (negative control). Mix the solutions in the three test tubes, and allow to stand for 1 min.

**Acceptance criteria:** A yellow color is produced in the solutions from the *Standard solution* and the *Sample solution*, while no yellow color is produced in the negative control.

### B. PEPTIDE MAPPING

**Solution A:** 6.9 mg/mL of monobasic sodium phosphate in water, adjusted with phosphoric acid to a pH of 2.85. Filter, and degas.

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
91	70	30
121	40	60
131	40	60

**Dialysis solution:** 480 mg/mL of urea, 44 mg/mL of tris(hydroxymethyl)aminomethane, and 0.88 mg/mL of edetic acid in water. Adjust with hydrochloric acid to a pH of 8.6.

**Standard solution:** Prepare a solution containing 1.0 mg/mL of USP Alteplase RS in water. Dialyze 2.0 mL of this solution into the *Dialysis solution* at room temperature for NLT 12 h. Measure the volume of the solution, and transfer it to a clean test tube. For each mL of solution in the tube, add 10  $\mu$ L of 1 M dithiothreitol. Incubate at room temperature for 4 h, then add 25  $\mu$ L of 1 M iodoacetic acid per mL of the solution, and incubate in the dark for 30 min. Quench the reaction by adding 50  $\mu$ L of 1 M dithiothreitol per mL of the solution. Dialyze the solution against 0.1 M ammonium bicarbonate for 24 h, replacing the 0.1 M ammonium bicarbonate twice during the dialysis period. To 2.0 mL of the dialyzed solution, add 20  $\mu$ g of trypsin, and incubate for 6–8 h at room temperature. Again add 20  $\mu$ g of trypsin, and incubate for 16–18 h for a total of 24 h of incubation of the trypsin-treated solution.

[NOTE—Store the *Standard solution* in a freezer.]

**Sample solution:** Using an accurately weighed quantity of Alteplase, proceed as directed in the *Standard solution*.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 4.6-mm  $\times$  10-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between peaks 6 and 7 as defined by the USP Alteplase RS Data Sheet. The times for peaks 6 and 7 baseline widths are NMT 0.5 min.

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and a mixture of the *Standard solution* and the *Sample solution* (1:1)

Measure the responses for NLT 20 major peaks as defined in the USP Alteplase RS Data Sheet.

**Acceptance criteria:** The retention times of the corresponding peaks of the *Standard solution* and the *Sample solution* do not differ by more than 0.4 min, and the peak area ratios relative to peak 19 (as shown on the USP Alteplase RS Data Sheet) do not differ by more than 20%. No additional significant peaks or shoulders are found, a significant peak or shoulder being defined as one having a peak response of NLT 5% of peak 19.

## ASSAY

### BIOLOGICAL POTENCY

**Buffer:** 1.38 mg/mL of monobasic sodium phosphate, 7.10 mg/mL of anhydrous dibasic sodium phosphate, 0.20 mg/mL of sodium azide, and 0.10 mg/mL of polysorbate 80 in water

**Human thrombin solution:** 33 U.S. Units in terms of the U.S. Standard Thrombin/mL in *Buffer*

**Human fibrinogen solution:** 2 mg/mL of human fibrinogen in *Buffer*

**Human plasminogen solution:** 1 mg/mL of human plasminogen in *Buffer*

**Standard stock solution:** 1.0 mg/mL (580,000 USP Alteplase Units) of USP Alteplase RS in water

**Standard solutions:** Dilute volumes of *Standard stock solution* with water to obtain a series of five *Standard solutions* having known concentrations ranging from 145 to 9.3 USP Alteplase Units/mL.

**Sample stock solution:** 1.0 mg/mL of Alteplase in water

**Sample solutions:** Dilute a volume of *Sample stock solution* with *Buffer* to obtain a series of dilutions of about 1:20,000; 1:10,000; and 1:5,000.

#### Analysis

**Samples:** *Standard solutions* and *Sample solutions*

To a set of labeled glass test tubes add 0.5 mL of *Human thrombin solution*. To separate test tubes add 0.5 mL of each *Standard solution* or *Sample solution*, and store on ice. To a second set of labeled glass tubes, add 20  $\mu$ L of *Human plasminogen solution* and 1 mL of *Human fibrinogen solution*, and store on ice. Beginning with the thrombin–*Standard solution* mixture containing the *Standard solution* with the lowest number of USP Units/mL, record the time, and separately add 200  $\mu$ L of each of the thrombin–*Standard solution* mixtures to the test tubes containing the plasminogen–fibrinogen mixture. Using a vortex mixer, intermittently mix the contents of each tube for a total of 15 s, and carefully place into a rack in a 37° circulating water bath. A visually turbid clot forms within 30 s, followed by the formation of bubbles within the clot. Record the clot lysis time ( $t_d$ ) from the first addition of the Alteplase solution to the last bubble to rise to the surface.

Using a least squares fit, determine the equation of the line using the log values of the standard concentra-

tion, in USP Alteplase Units/mL, versus the log values of their clot lysis times in s taken:

$$\log t = m(\log U_s) + b$$

- $t$  = time to bubble release (s)  
 $m$  = slope of the line  
 $U_s$  = activity of the *Standard solution* (USP Alteplase Units/mL)  
 $b$  = y-intercept of the line

The correlation coefficient is NLT  $-0.9900$ . From the line equation and using the log of the clot lysis time for the *Sample solution*, calculate the log of the activity ( $U_A$ ):

$$\log U_A = \{[(\log t) - b]/m\}$$

Calculate the alteplase activity in USP Alteplase Units/mL taken:

$$\text{Result} = D(10^{\log U})$$

- $D$  = dilution factor for the *Sample solution*  
 Calculate the specific activity in the portion of Alteplase taken:

$$\text{Result} = (U_A/P)$$

- $P$  = concentration of protein obtained in the test for *Protein Content*

**Acceptance criteria:** 90.0%–115.0% of the potency stated on the label, the potency being 580,000 USP Alteplase Units/mg of protein

## OTHER COMPONENTS

### • PROTEIN CONTENT

**Arginine solution:** 34.8 mg/mL of arginine in water. Adjust with phosphoric acid to a pH of 7.3.

**Sample stock solution:** 1 mg/mL of Alteplase in water

**Sample solution:** Dilute a volume of *Sample stock solution* with a volume of *Arginine solution* to obtain a solution having an absorbance value of 0.5–1.0 at the wavelength of maximum absorbance at about 280 nm. Determine the dilution volume ( $V$ ).

### Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

**Mode:** UV

**Wavelength range:** 240–500 nm

**Analytical wavelengths:** 320 nm and maximum absorbance at about 280 nm

**Cell:** 1 cm

**Blank:** *Arginine solution*

### Analysis

**Samples:** *Sample solution* and *Blank*

Calculate the protein content in the portion of Alteplase taken:

$$\text{Result} = [(A_{\max} - A_{320})/\epsilon] \times V$$

- $A_{\max}$  = absorbance value at the wavelength of maximum absorbance  
 $A_{320}$  = absorbance of the *Sample solution* at 320 nm  
 $\epsilon$  = molar absorptivity of Alteplase, 1.9  
 $V$  = volume of *Arginine solution* required to prepare the *Sample solution*

## IMPURITIES

### • CHROMATOGRAPHIC PURITY

**SDS buffer:** 400 mg/mL of glycerol, 5.52 mg/mL of tris(hydroxymethyl)aminomethane hydrochloride, 3.28 mg/mL of tris(hydroxymethyl)aminomethane, 0.20 mg/mL of bromophenol blue, and 0.20 mg/mL of xylene cyanole FF in sodium dodecyl sulfate solution (8 in 100)

**Diluted SDS buffer:** Dilute 1 volume of *SDS buffer* with 4 volumes of water.

**Running buffer:** 3.03 mg/mL of tris(hydroxymethyl)aminomethane and 14.26 mg/mL of glycine in sodium dodecyl sulfate (1 in 1000)

**Carboxymethylation buffer:** 480 mg/mL of urea, 44 mg/mL of tris(hydroxymethyl)aminomethane, and 1.2 mg/mL of edetic acid in water. Adjust with hydrochloric acid, if necessary, to a pH of 8.6.

**Ammoniacal silver nitrate solution:** Transfer 105 mL of sodium hydroxide solution (0.36 in 100) and 7.0 mL of ammonium hydroxide to a 500-mL volumetric flask, and add slowly, with stirring, 20.0 mL of silver nitrate solution (20 in 100). Dilute with water to volume.

[NOTE—Prepare this solution immediately before use, and protect it from light. This amount of solution is sufficient for two slab gels.]

**Citric acid-formaldehyde solution:** To 500 mL of water add 25 mg of citric acid, 0.25 mL of formaldehyde, and 0.025 mL of methanol, omitting the methanol if the formaldehyde is preserved with methanol. [NOTE—Prepare this solution fresh at the time of use.

This amount of solution is sufficient for two slab gels.]

**Gel:** Prepare a 10% T (total acrylamide)–0.25% C (cross-linked bisacrylamide) resolving gel containing 0.1% sodium dodecyl sulfate, 0.375 M tris(hydroxymethyl)aminomethane hydrochloride, and 0.05 M tris(hydroxymethyl)aminomethane.

**Arginine solution:** 34.8 mg/mL of arginine in water. Adjust with phosphoric acid to a pH of 7.3.

**Molecular weight standard solution:** Use a commercially available preparation of low molecular weight protein standards (10,000–100,000 Da) at 2 mg/mL. Mix 990  $\mu$ L of *Diluted SDS buffer* and 10  $\mu$ L of the molecular weight standard mixture.

**Control solution:** Prepare a control solution of bovine serum albumin containing 10  $\mu$ g/mL. For a 10 ng/25  $\mu$ L load, mix 600  $\mu$ L of *Diluted SDS buffer* and 25  $\mu$ L of the control solution, and heat at 90° for 2 min. For a 2.5 ng/25  $\mu$ L load, mix 594  $\mu$ L of *Diluted SDS buffer* and 6  $\mu$ L of the control solution, and heat at 90° for 2 min.

**Standard stock solution:** 1 mg/mL of USP Alteplase RS in water

**Standard solution:** Dilute an accurately measured volume of *Standard stock solution* in *Arginine solution* to obtain a solution having a final concentration of 0.25 mg/mL. Heat 0.5 mL of this solution with 116  $\mu$ L of *SDS buffer* and 10  $\mu$ L of 1 M dithiothreitol at 80° for 2 min.

**Carboxymethylated standard solution:** Dilute 1.0 mL of *Standard stock solution* with 1 mL of *Carboxymethylation buffer*, and adjust with 1 M sodium hydroxide to a pH of 8.5. Add 20  $\mu$ L of 1 M dithiothreitol, and incubate at 37° for 60 min. Add 100  $\mu$ L of 1 M iodoacetic acid, and incubate in the dark for 20 min. Desalt by passing the solution through a chromatographic column containing fine gel chromatographic packing equilibrated with a buffer solution containing 20 mg/mL of sodium dodecyl sulfate, 100 mg/mL of glycerol, 1.42 mg/mL of tris(hydroxymethyl)aminomethane hydrochloride, and 0.85 mg/mL of tris(hydroxymethyl)aminomethane. Collect the protein fraction of the preparation by elution with the same buffer, and add 20  $\mu$ L of 1 M dithiothreitol. Adjust the protein concentration to about 0.2 mg/mL with a buffer solution containing 20 mg/mL of sodium dodecyl sulfate, 100 mg/mL of glycerol, 1.42 mg/mL of tris(hydroxymethyl)aminomethane hydrochloride, 0.85 mg/mL of tris(hydroxymethyl)aminomethane, 1.06 mg/mL of dithiothreitol, 0.05 mg/mL of bromophenol blue, and 0.05 mg/mL of xylene cyanole FF.

**Sample stock solution, Sample solution, and Carboxymethylated sample solution:** Using an accurately weighed quantity of Alteplase, proceed as directed for *Standard stock solution*, *Standard solution*, and *Carboxymethylated standard solution*.

**Blank:** Mix 500  $\mu$ L of water, 126  $\mu$ L of SDS buffer, and 10  $\mu$ L of 1 M dithiothreitol.

#### Analysis

**Samples:** Molecular weight standard solution, Control solution, Standard solution, Carboxymethylated standard solution, Sample solution, Carboxymethylated sample solution, and Blank

Separately apply equal volumes (about 25  $\mu$ L) of the Standard solution, Carboxymethylated standard solution, Sample solution, and Carboxymethylated sample solution at the 5- $\mu$ g load; apply equal volumes (about 38  $\mu$ L) of the Standard solution and the Carboxymethylated standard solution at the 7.5- $\mu$ g load; and apply the Control solutions at the 10- and 2.5-ng load onto separate lanes of the gel. Apply about 25  $\mu$ L of the Molecular weight standard solution to each side of the gel, and apply about 25  $\mu$ L of the Blank onto a separate lane. Apply the Standard solution and the Sample solution on one half and the Carboxymethylated standard solution and Carboxymethylated sample solution on the other half. Perform the electrophoresis using a constant current of 1.3–1.5 mA/cm of gel length and the Running buffer. Remove the gel from the apparatus 10–20 min after the tracking dye starts to move. Place the gel in 250 mL of a solution of 20% alcohol and 6% glacial acetic acid for NLT 1 h, and change the solution every 20 min, leaving the gel to soak overnight following the last change.

Perform silver staining of the gel by placing the gel in 250 mL of a 10% glutaraldehyde solution (v/v) in a shallow dish, and shake for about 30 min. Replace the glutaraldehyde solution with distilled water, allow the gel to soak for about 20 min, and then change the water. Repeat for a total of three washings. Transfer the gel to a dish, and cover with 250 mL of Ammoniacal silver nitrate solution. Place the dish on a shaker for about 15 min. Rinse four times with 250 mL of water, rocking the dish for 1 min between rinses. Continue rocking to prevent the gel from sticking and to facilitate washing.

Transfer the gel to a clear dish containing 250 mL of Citric acid–formaldehyde solution, and rock the dish. Protein bands become visible. When the gel is visibly stained, wash immediately with water, and rinse it repeatedly with water to remove the Citric acid–formaldehyde solution. Rinse the gel for NLT 1 h, and dry. Soak cellophane membranes in glycerol solution (2 in 100). Roll a membrane onto a rigid sheet of plastic. Roll the gel onto the membrane, and cover with another membrane. Lay a frame on the edges of the membranes, and clamp it to the rigid plastic sheet. Dismantle the dryer, and cut off excess cellophane when dry (about 24 h). Visually examine the gel under light.

**System suitability:** The 2.5- and 10-ng Control solutions must be visible. The nonreduced Control solutions migrate with an apparent molecular weight of slightly less than 66,000 Da, as compared with the Molecular weight standard solution.

**Acceptance criteria:** The Sample solution exhibits three major bands in the region between 66,000 Da and 31,000 Da, corresponding to the major bands from the Standard solution. The Carboxymethylated sample solution exhibits six major bands in the region between 92,500 Da and 45,000 Da, corresponding to the major bands from the Carboxymethylated standard solution.

#### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 1 USP Endotoxin Unit/mg of Alteplase
- **SINGLE-CHAIN CONTENT**

**Mobile phase:** 27.6 g of monobasic sodium phosphate in 1000 mL of sodium dodecyl sulfate solution (1 in 1000). Adjust with sodium hydroxide to a pH of 6.8. Filter, and degas.

**Dithiothreitol solution:** 3.12 mg/mL of dithiothreitol in Mobile phase

**Standard stock solution:** Using an accurately weighed quantity of USP Alteplase RS, make a 1-mg/mL solution in water.

**Standard solution:** Pipet 1 mL of the Standard stock solution into a glass tube, add 3 mL of Dithiothreitol solution, cap the tube, and invert to mix. Heat for 3–5 min at about 80°.

**Sample stock solution:** Using an accurately weighed quantity of Alteplase, make a 1-mg/mL solution in water.

**Sample solution:** Pipet 1 mL of the Sample stock solution into a glass tube, add 3 mL of Dithiothreitol solution, cap the tube, and invert to mix. Heat for 3–5 min at about 80°.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 7.5-mm  $\times$  60-cm; packing L25

**Flow rate:** 0.5 mL/min

**Injection volume:** 50  $\mu$ L

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Resolution:** NLT 1.1 between the single-chain and two-chain alteplase peaks

#### Analysis

**Samples:** Standard solution and Sample solution

[NOTE—The major peaks are from single-chain and two-chain alteplase and from higher and lower molecular weight species.]

Calculate the percentage of single-chain alteplase in the portion of Alteplase taken:

$$\text{Result} = (r_u/r_T) \times 100$$

$r_u$  = peak response for single-chain alteplase

$r_T$  = sum of all the peak responses of alteplase

**Acceptance criteria:** No peaks or shoulders in the Sample solution that are not present in the Standard solution are found; NLT 60%.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store in the frozen state at a temperature of –20° or below.
- **USP REFERENCE STANDARDS (11)**  
USP Alteplase RS  
USP Endotoxin RS

## Alteplase for Injection

#### DEFINITION

Alteplase for Injection is a sterile lyophilized preparation of Alteplase. Its biological activity is NLT 90% and NMT 115% of that stated on the label in USP Alteplase Units. It contains NLT 95% and NMT 111% of the total protein content stated on the label.

#### IDENTIFICATION

- **A.**  
**Standard solution:** 1.0–2.5 mg/mL of USP Alteplase RS in water  
**Sample solution:** Prepare similarly to the Standard solution.  
**Analysis**  
**Samples:** Standard solution and Sample solution  
To each of three test tubes transfer 1 mL of 0.5-mg/mL H-D-isoleucyl-prolyl-arginyl-p-nitroaniline dihydrochloride. Separately transfer 200  $\mu$ L of the Standard solution

and 200  $\mu$ L of the *Sample solution* to two of the test tubes. To the third test tube add 200  $\mu$ L of 0.2 M arginine solution that has been adjusted with phosphoric acid to a pH of 7.3 (negative control). Mix the solutions in the three test tubes, and allow to stand for 1 min.

**Acceptance criteria:** A yellow color is produced in the solutions from the *Standard solution* and the *Sample solution*, while no yellow color is produced in the negative control.

#### • B. PEPTIDE MAPPING

**Solution A:** 6.9 mg/mL of monobasic sodium phosphate in water, adjusted with phosphoric acid to a pH of 2.85. Filter, and degas.

**Solution B:** Acetonitrile

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
91	70	30
121	40	60
131	40	60

**Dialysis solution:** 480 mg/mL of urea, 44 mg/mL of tris(hydroxymethyl)aminomethane, and 0.88 mg/mL of edetic acid in water. Adjust with hydrochloric acid to a pH of 8.6.

**Standard solution:** Prepare a solution containing 1.0 mg/mL of USP Alteplase RS in water. Dialyze 2.0 mL of this solution into the *Dialysis solution* at room temperature for NLT 12 h. Measure the volume of the solution, and transfer it to a clean test tube. For each mL of solution in the tube, add 10  $\mu$ L of 1 M dithiothreitol. Incubate at room temperature for 4 h, then add 25  $\mu$ L of 1 M iodoacetic acid per mL of the solution, and incubate in the dark for 30 min. Quench the reaction by adding 50  $\mu$ L of 1 M dithiothreitol per mL of the solution. Dialyze the solution against 0.1 M ammonium bicarbonate for 24 h, replacing the 0.1 M ammonium bicarbonate twice during the dialysis period. To 2.0 mL of the dialyzed solution, add 20  $\mu$ g of trypsin, and incubate for 6–8 h at room temperature. Again add 20  $\mu$ g of trypsin, and incubate for 16–18 h for a total of 24 h of incubation of the trypsin-treated solution. [NOTE—Store the *Standard solution* in a freezer.]

**Sample solution:** Using a quantity of Alteplase for Injection, proceed as directed in the *Standard solution*.

#### Chromatographic system

(See Chromatography (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 4.6-mm  $\times$  10-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between peaks 6 and 7 as defined by the USP Alteplase RS Data Sheet. The times for peaks 6 and 7 baseline widths are NMT 0.5 min.

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and a mixture of the *Standard solution* and the *Sample solution* (1:1)

Measure the responses for NLT 20 major peaks as defined in the USP Alteplase RS Data Sheet.

**Acceptance criteria:** The retention times of corresponding peaks of the *Standard solution* and the *Sample solution* do not differ by more than 0.4 min, and the peak area ratios relative to peak 19 (as shown on the USP

Alteplase RS Data Sheet) do not differ by more than 20%. No additional significant peaks or shoulders are found, a significant peak or shoulder being defined as one having a peak response of NLT 5% of peak 19.

#### ASSAY

##### • BIOLOGICAL POTENCY

**Buffer:** 1.38 mg/mL of monobasic sodium phosphate, 7.10 mg/mL of anhydrous dibasic sodium phosphate, 0.20 mg/mL of sodium azide, and 0.10 mg/mL of polysorbate 80 in water

**Human thrombin solution:** 33 U.S. Units in terms of the U.S. Standard Thrombin/mL in *Buffer*

**Human fibrinogen solution:** 2 mg/mL of human fibrinogen in *Buffer*

**Human plasminogen solution:** 1 mg/mL of human plasminogen in *Buffer*

**Standard stock solution:** 1.0 mg/mL (580,000 USP Alteplase Units) of USP Alteplase RS in water

**Standard solutions:** Dilute volumes of *Standard stock solution* with water to obtain a series of five *Standard solutions* having known concentrations ranging from 145 to 9.3 USP Alteplase Units/mL.

**Sample stock solution:** 1.0 mg/mL of Alteplase for Injection in water

**Sample solutions:** Dilute a volume of *Sample stock solution* with *Buffer* to obtain a series of dilutions of about 1:20,000; 1:10,000; and 1:5,000.

#### Analysis

**Samples:** *Standard solutions* and *Sample solutions*

To a set of labeled glass test tubes add 0.5 mL of *Human thrombin solution*. To separate test tubes add 0.5 mL of each *Standard solution* or *Sample solution*, and store on ice. To a second set of labeled glass tubes, add 20  $\mu$ L of *Human plasminogen solution* and 1 mL of *Human fibrinogen solution*, and store on ice. Beginning with the thrombin–*Standard solution* mixture containing the *Standard solution* with the lowest number of USP Units/mL, record the time, and separately add 200  $\mu$ L of each of the thrombin–*Standard solution* mixtures to the test tubes containing the plasminogen–fibrinogen mixture. Using a vortex mixer, intermittently mix the contents of each tube for a total of 15 s, and carefully place into a rack in a 37° circulating water bath. A visually turbid clot forms within 30 s, followed by the formation of bubbles within the clot. Record the clot lysis time ( $t_c$ ) from the first addition of the alteplase solution to the last bubble to rise to the surface.

Using a least squares fit, determine the equation of the line using the log values of the standard concentration, in USP Alteplase Units/mL, versus the log values of their clot lysis times in seconds taken:

$$\log t = m(\log U_s) + b$$

$t$  = time to bubble release (s)

$m$  = slope of the line

$U_s$  = activity of the *Standard solution* (USP Alteplase Units/mL)

$b$  = y-intercept of the line

The correlation coefficient is NLT –0.9900. From the line equation and using the log of the clot lysis time for the *Sample solution*, calculate the log of the activity ( $U_A$ ):

$$\log U_A = [(\log t) - b]/m$$

Calculate the alteplase activity in USP Alteplase Units/mL taken:

$$\text{Result} = D(10^{\log U})$$

$D$  = dilution factor for the *Sample solution*

Calculate the specific activity in the portion of Alteplase for Injection taken:

$$\text{Result} = (U_A/P)$$

$P$  = concentration of protein obtained in the test for Protein Content

**Acceptance criteria:** 90%–115% of the potency stated on the label in USP Alteplase Units

## OTHER COMPONENTS

### • PROTEIN CONTENT

**Arginine solution:** 34.8 mg/mL of arginine in water. Adjust with phosphoric acid to a pH of 7.3.

**Sample stock solution:** 1 mg/mL of Alteplase for Injection in water

**Sample solution:** Dilute a volume of *Sample stock solution* with a volume of *Arginine solution* to obtain a solution having an absorbance value of 0.5–1.0 at the wavelength of maximum absorbance at about 280 nm. Determine the dilution volume ( $V$ ).

### Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

**Mode:** UV

**Wavelength range:** 240–500 nm

**Analytical wavelengths:** 320 nm and maximum absorbance at about 280 nm

**Cell:** 1 cm

**Blank:** *Arginine solution*

### Analysis

**Samples:** *Sample solution* and *Blank*

Calculate the protein content in the portion of Alteplase for Injection taken:

$$\text{Result} = [(A_{\text{max}} - A_{320})/\epsilon] \times V$$

$A_{\text{max}}$  = absorbance value at the wavelength of maximum absorbance

$A_{320}$  = absorbance of the *Sample solution* at 320 nm

$\epsilon$  = molar absorptivity of alteplase, 1.9

$V$  = volume of *Arginine solution* required to prepare the *Sample solution*

**Acceptance criteria:** 95%–111% of the total protein content stated on the label

## PERFORMANCE TESTS

### • UNIFORMITY OF DOSAGE UNITS (905)

**Acceptance criteria:** Meets the requirements for *Content Uniformity*

## SPECIFIC TESTS

### • PERCENT MONOMER

**Mobile phase:** 34.84 mg/mL of arginine, 158.56 mg/mL of ammonium sulfate, and 100 mL/L of isopropyl alcohol in water. Adjust with phosphoric acid to a pH of 7.3, degas, and pass through a filter of 0.45- $\mu$ m pore size.

**System suitability solution:** 1 mg/mL each of chicken ovalbumin and bovine gamma globulin

**Standard solution:** 1 mg/mL of USP Alteplase RS in water

**Sample solution:** 1 mg/mL of Alteplase for Injection in water

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 7.5-mm  $\times$  30-cm; packing L25

**Flow rate:** 0.5–1.0 mL/min

**Injection volume:** 50  $\mu$ L

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

### Suitability requirements

**Resolution:** NLT 1.6 between gamma globulin and ovalbumin, *System suitability solution*

**Column efficiency:** NLT 1200 theoretical plates, determined from the alteplase peak, *Standard solution*

### Analysis

**Sample:** *Sample solution*

Calculate, as a percentage, the monomer in the portion of Alteplase for Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of the alteplase monomer

$r_T$  = sum of all the peak responses related to alteplase

**Acceptance criteria:** NLT 95.0%

### • SINGLE-CHAIN CONTENT

**Mobile phase:** 27.6 mg/mL of monobasic sodium phosphate in sodium dodecyl sulfate solution (1 in 1000). Adjust with sodium hydroxide to a pH of 6.8. Filter, and degas.

**Dithiothreitol solution:** 3.12 mg/mL of dithiothreitol in *Mobile phase*

**Standard stock solution:** Using an accurately weighed quantity of USP Alteplase RS, make a 1-mg/mL solution in water.

**Standard solution:** Pipet 1 mL of the *Standard stock solution* into a glass tube. Add 3 mL of *Dithiothreitol solution*, cap the tube, and invert to mix. Heat for 3–5 min at about 80°.

**Sample stock solution:** Using an accurately weighed quantity of Alteplase for Injection, make a 1-mg/mL solution in water.

**Sample solution:** Pipet 1 mL of the *Sample stock solution* into a glass tube. Add 3 mL of *Dithiothreitol solution*, cap the tube, and invert to mix. Heat for 3–5 min at about 80°.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 7.5-mm  $\times$  60-cm; packing L25

**Flow rate:** 0.5 mL/min

**Injection volume:** 50  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Resolution:** NLT 1.1 between the single-chain and two-chain alteplase peaks

### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The major peaks are from single-chain and two-chain alteplase and from higher and lower molecular weight species.]

Calculate the percentage of single-chain alteplase in the portion of Alteplase for Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for single-chain alteplase

$r_T$  = sum of all the peak responses of alteplase

**Acceptance criteria:** No peaks or shoulders in the *Sample solution* that are not present in the *Standard solution* are found; NLT 60%.

• **INJECTIONS AND IMPLANTED DRUG PRODUCTS (1):** Meets the requirements of constituted solutions at the time of use

• **pH (791)**

**Sample solution:** Constitute as directed in the labeling.

**Acceptance criteria:** 7.1–7.5

• **WATER DETERMINATION (921), Method I:** NMT 4.0%

• **BACTERIAL ENDOTOXINS TEST (85):** NMT 1 USP Endotoxin Unit/mg

• **STERILITY TESTS (71):** Meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*

• **BIOLOGICAL REACTIVITY TESTS, IN VIVO (88):** Meets the requirements for *Safety Tests—Biologicals*

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in hermetic, light-resistant containers, and store in a refrigerator.
- **LABELING:** Label it to state the biological activity in USP Alteplase Units/vial and the amount of protein/vial.
- **USP REFERENCE STANDARDS** (11)  
USP Alteplase RS  
USP Endotoxin RS

**Altretamine**

$C_9H_{18}N_6$  210.28  
1,3,5-Triazine-2,4,6-triamine, *N,N,N',N'',N''*-hexamethyl-;  
Hexamethylmelamine [645-05-6].

**DEFINITION**

Altretamine contains NLT 98.0% and NMT 102.0% of altretamine ( $C_9H_{18}N_6$ ), calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer:** 0.79 g/L of ammonium carbonate in water. Adjust with a solution of formic acid (1 in 10) or ammonium hydroxide (1 in 10) to a pH of  $8.0 \pm 0.05$ .

**Diluent:** Methanol and water (65:35)

**Mobile phase:** Methanol and *Buffer* (65:35)

**Standard stock solution:** 0.5 mg/mL of USP Altretamine RS in a mixture of methanol and water (70:30), prepared by first dissolving the Standard in methanol and then diluting with water to final volume.

**Standard solution:** 0.05 mg/mL of USP Altretamine RS in *Diluent*, from *Standard stock solution*

**Sample stock solution:** Transfer 25 mg of Altretamine to a 50-mL volumetric flask. Dissolve in 35 mL of methanol, and dilute with water to volume.

**Sample solution:** 0.05 mg/mL of Altretamine in *Diluent*, from *Sample stock solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 227 nm

**Column:** 4.6-mm  $\times$  30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of altretamine ( $C_9H_{18}N_6$ ) in the portion of Altretamine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Altretamine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%

**Delete the following:**

- **HEAVY METALS, Method II** (231): NMT 40 ppm (Official 1-Jan-2018)

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method I** (921): NMT 1%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Altretamine RS

**Altretamine Capsules****DEFINITION**

Altretamine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of altretamine ( $C_9H_{18}N_6$ ).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)

**Sample:** Remove as completely as possible the contents of 5 Capsules, and dissolve, with shaking, in 10 mL of chloroform. Filter, and evaporate the chloroform solution to dryness.

**Acceptance criteria:** Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer:** 0.79 g/L of ammonium carbonate in water. Adjust with a solution of formic acid (1 in 10) or ammonium hydroxide (1 in 10) to a pH of  $8.0 \pm 0.05$ .

**Diluent:** Methanol and water (65:35)

**Mobile phase:** Methanol and *Buffer* (65:35)

**Standard stock solution:** 0.5 mg/mL of USP Altretamine RS in a mixture of methanol and water (70:30), prepared by first dissolving the Standard in methanol and then diluting with water to final volume.

**Standard solution:** 0.05 mg/mL of USP Altretamine RS in *Diluent*, from *Standard stock solution*

**Sample stock solution:** Remove as completely as possible the contents of NLT 20 Capsules, and weigh. Mix the combined contents, and transfer as completely as possible to a 500-mL volumetric flask. Add 325 mL of methanol, and sonicate. Dilute with water to volume.

**Sample solution:** Transfer a volume of the *Sample stock solution*, equivalent to 10 mg of altretamine, to a 200-mL volumetric flask, and dilute with *Diluent* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm × 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of altretamine ( $C_9H_{18}N_6$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Altretamine RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Detector: UV 242 nm

Standard solution: USP Altretamine RS in Medium

Analysis: Determine the amount of  $C_9H_{18}N_6$  dissolved from UV absorbances on filtered portions of the solution under test, suitably diluted if necessary with Medium, compared with the Standard solution.

Tolerances: NLT 80% (Q) of the labeled amount of  $C_9H_{18}N_6$  is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in tight, light-resistant containers, and store at controlled room temperature.

### • USP REFERENCE STANDARDS (11)

USP Altretamine RS

## Ammonium Alum

$AlNH_4(SO_4)_2 \cdot 12H_2O$  453.33

$AlNH_4(SO_4)_2$  237.15

Sulfuric acid, aluminum ammonium salt (2:1:1), dodecahydrate;

Aluminum ammonium sulfate (1:1:2), dodecahydrate [7784-26-1].

Anhydrous [7784-25-0].

## DEFINITION

Ammonium Alum contains NLT 99.0% and NMT 100.5% of ammonium alum [ $AlNH_4(SO_4)_2$ ], calculated on the dried basis.

## IDENTIFICATION

### • A.

Sample solution: 50 mg/mL

Analysis: Add 1 N sodium hydroxide dropwise to the Sample solution.

Acceptance criteria: A precipitate is formed, and it dissolves in an excess of the reagent with the evolution of ammonia, recognizable by its alkaline effect upon moistened red litmus paper exposed to the vapor.

### • B. IDENTIFICATION TESTS—GENERAL, Aluminum (191)

Sample solution: 50 mg/mL

Acceptance criteria: Meets the requirements

### • C. IDENTIFICATION TESTS—GENERAL, Sulfate (191)

Sample solution: 50 mg/mL

Analysis: Proceed as directed in Identification Tests—General, Sulfate (191), except centrifuge the neutral solutions of sulfates and use the supernatants for the lead acetate test.

Acceptance criteria: Meets the requirements

## ASSAY

### • PROCEDURE

Edetate disodium titrant: Prepare and standardize as directed in Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M).

Sample: 800 mg of Ammonium Alum

Analysis: Transfer the Sample to a 400-mL beaker, moisten with 1 mL of glacial acetic acid, and add 50 mL of water, 50.0 mL of Edetate disodium titrant and 20 mL of acetic acid–ammonium acetate buffer TS. Warm on a steam bath until the solution is complete, and boil gently for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and titrate the excess edetate disodium with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each mL of 0.05 M Edetate disodium titrant is equivalent to 11.86 mg of  $AlNH_4(SO_4)_2$ .

Acceptance criteria: 99.0%–100.5% on the dried basis

## IMPURITIES

Delete the following:

### • HEAVY METALS, Method I (231)

Test preparation: Dissolve 1 g in 20 mL of water, and add 5 mL of 0.1 N hydrochloric acid. Evaporate the solution in a porcelain evaporating dish to dryness. Treat the residue with 20 mL of water, and add 50 mg of hydroxylamine hydrochloride. Heat the solution on a steam bath for 10 min, cool, and dilute with water to 25 mL.

Analysis: Proceed as directed in the chapter, except add 50 mg of hydroxylamine hydrochloride to the Standard Preparation.

Acceptance criteria: 20 ppm (Official 1-Jan-2018)

### • IRON

Sample solution: 6.7 mg/mL

Analysis: Add 5 drops of potassium ferrocyanide TS to 20 mL of the Sample solution.

Acceptance criteria: No blue color is produced immediately.

## SPECIFIC TESTS

### • LOSS ON DRYING (731)

Sample: 2.0 g

Analysis: Transfer the Sample, in a tared porcelain crucible, to a muffle furnace at 200°. Increase the temperature to 300°, and dry at 300° to a constant weight. Cool in a desiccator, and weigh.

Acceptance criteria: 45.0%–48.0%

### • LIMIT OF ALKALIES AND ALKALINE EARTHS

Sample: 1 g

Analysis: Completely precipitate the aluminum from a boiling solution of the Sample in 100 mL of water by the addition of sufficient 6 N ammonium hydroxide to render the solution distinctly alkaline to methyl red TS, and filter. Evaporate the filtrate to dryness, and ignite.

Acceptance criteria: The weight of the residue is NMT 5 mg (0.5%).

## Potassium Alum

$\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	474.39
$\text{AlK}(\text{SO}_4)_2$	258.21
Sulfuric acid, aluminum potassium salt (2:1:1), dodecahydrate;	
Aluminum potassium sulfate (1:1:2) dodecahydrate [7784-24-9].	
Anhydrous [10043-67-1].	

### DEFINITION

Potassium Alum contains NLT 99.0% and NMT 100.5% of potassium alum  $[\text{AlK}(\text{SO}_4)_2]$ , calculated on the dried basis.

### IDENTIFICATION

- **A.**  
**Sample solution:** 50 mg/mL in water  
**Analysis:** Add 1 N sodium hydroxide dropwise to the *Sample solution*.  
**Acceptance criteria:** A precipitate is formed that dissolves in an excess of the reagent. Ammonia is not evolved (distinction from ammonium alum).
- **B.**  
**Analysis:** Hold it in a nonluminous flame.  
**Acceptance criteria:** A violet color is imparted to the flame.
- **C.**  
**Sample solution:** Saturated solution in water  
**Analysis:** Add 10 mL of sodium bitartrate TS to 5 mL of the *Sample solution*.  
**Acceptance criteria:** A white, crystalline precipitate is formed within 30 min.
- **D. IDENTIFICATION TESTS—GENERAL, Aluminum (191) AND Sulfate (191)**  
**Sample solution:** 50 mg/mL in water  
**Acceptance criteria:** Meets the requirements

### ASSAY

- **PROCEDURE**  
**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Indicators, and Solutions—Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.  
**Sample:** 800 mg  
**Analysis:** Transfer the *Sample* to a 400-mL beaker, moisten with 1 mL of glacial acetic acid, and add 50 mL of water, 50.0 mL of *Edetate disodium titrant*, and 20 mL of acetic acid–ammonium acetate buffer TS. Warm on a steam bath until solution is complete, and boil gently for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and titrate 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 12.91 mg of potassium alum  $[\text{AlK}(\text{SO}_4)_2]$ .  
**Acceptance criteria:** 99.0%–100.5% on the dried basis

### IMPURITIES

#### Delete the following:

- **HEAVY METALS, Method I (231)**  
**Sample solution:** Dissolve 1 g in water to make 20 mL, and add 5 mL of 0.1 N hydrochloric acid. Evaporate the solution in a porcelain evaporating dish to dryness. Treat the residue with 20 mL of water, and add 50 mg of hydroxylamine hydrochloride. Heat the solution on a steam bath for 10 min, cool, and dilute with water to 25 mL.  
**Analysis:** Proceed as directed, except add 50 mg of hydroxylamine hydrochloride to the *Standard Preparation*.

**Acceptance criteria:** 20 ppm (Official 1-Jan-2018)

#### IRON

**Sample solution:** Potassium alum in water (1 in 150)  
**Analysis:** Add 5 drops of potassium ferrocyanide TS to 20 mL of the *Sample solution*.

**Acceptance criteria:** No blue color is produced immediately.

### SPECIFIC TESTS

#### LOSS ON DRYING (731)

**Sample:** 2.0 g

**Analysis:** Transfer the *Sample* in a tared porcelain crucible to a muffle furnace at 200°. Increase the temperature to 400°, and dry at 400° to constant weight. Cool in a desiccator, and weigh.

**Acceptance criteria:** 43.0%–46.0%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at room temperature.

## Alumina and Magnesia Oral Suspension

### DEFINITION

Alumina and Magnesia Oral Suspension is a mixture containing aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and Magnesium Hydroxide  $[\text{Mg}(\text{OH})_2]$ . It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ . It may contain a flavoring agent, and may contain suitable antimicrobial agents.

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)**  
**Sample solution:** To a solution of 5 g in 10 mL of 3 N hydrochloric acid add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 min, and filter.  
**Acceptance criteria:** The filtrate meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Aluminum (191)**  
**Sample solution:** Wash the precipitate obtained in *Identification test A* with a hot solution containing 20 mg/mL of ammonium chloride, and dissolve the precipitate in hydrochloric acid.  
**Acceptance criteria:** The solution meets the requirements.

### ASSAY

#### ALUMINUM HYDROXIDE

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.

**Sample solution:** Transfer a volume of Oral Suspension, previously well shaken in its original container, equivalent to 1200 mg of aluminum hydroxide, to a suitable beaker. Add 20 mL of water, stir, and slowly add 10 mL of hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, and add water to volume.

**Analysis:** Pipet 10 mL of the *Sample solution* into a beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling point for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate the excess edetate disodium with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Sample solu-*

tion, and make any necessary correction. Each mL of *Edetate disodium titrant* consumed is equivalent to 3.900 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Acceptance criteria:** 90.0%–110.0%

#### • MAGNESIUM HYDROXIDE

**Sample solution:** Prepare as directed in the Assay for *Aluminum Hydroxide*.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 40 mg of magnesium hydroxide, into a 400-mL beaker. Add 200 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol), and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 2.916 mg of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

**Acceptance criteria:** 90.0%–110.0%

#### IMPURITIES

##### • CHLORIDE AND SULFATE, Chloride (221)

**Sample solution:** Dissolve 5.0 g in the minimum volume of nitric acid required to achieve complete solution, add 1 mL of acid in excess, then add water to make 100 mL, and filter.

**Acceptance criteria:** NMT 0.14%; a 10-mL portion of the *Sample solution* shows no more chloride than corresponds to 1.0 mL of 0.020 N hydrochloric acid.

##### • CHLORIDE AND SULFATE, Sulfate (221)

**Sample solution:** Dissolve 5.0 g in 5 mL of 3 N hydrochloric acid, with gentle heating. Cool, add water to make 250 mL, and filter.

**Acceptance criteria:** NMT 0.1%; a 20-mL portion of the *Sample solution* shows no more sulfate than corresponds to 0.40 mL of 0.020 N sulfuric acid.

##### • ARSENIC, Method I (211)

**Standard preparation:** Prepare as directed in *Arsenic* (211), except prepare it to contain 5 µg of arsenic instead of 3 µg.

**Test preparation:** Dissolve a portion of Oral Suspension, equivalent to 0.5 g of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , in 20 mL of 7 N sulfuric acid.

**Acceptance criteria:** NMT 10 ppm, based on the aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  content

#### Delete the following:

##### • HEAVY METALS (231)

**Test preparation:** Dissolve a portion of Oral Suspension, equivalent to 0.24 g of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , in 10 mL of 3 N hydrochloric acid with the aid of heat, filter, if necessary, and dilute with water to 25 mL.

**Acceptance criteria:** NMT 83 ppm, based on the aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  content. (Official 1-Jan-2018)

#### SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** Its total aerobic microbial count does not exceed  $10^2$  cfu/mL, and it meets the requirements for the absence of *Escherichia coli*.

• **pH (791):** 7.3–8.5

##### • ACID-NEUTRALIZING CAPACITY (301)

**Acceptance criteria:** The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq, and NLT the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (F_A \times A) + 0.8 \times (F_M \times M)$$

$F_A$  = theoretical acid-neutralizing capacity of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , 0.0385 mEq

$A$  = amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  in the specimen tested, based on the labeled quantity (mg)

$F_M$  = theoretical acid-neutralizing capacity of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , 0.0343 mEq

$M$  = amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the specimen tested, based on the labeled quantity (mg)

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid freezing.

• **LABELING:** Oral Suspension may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

## Alumina and Magnesia Tablets

#### DEFINITION

Alumina and Magnesia Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

#### IDENTIFICATION

##### • A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)

**Sample solution:** To a 0.7-g portion of finely powdered Tablets add 10 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution changes to deep yellow. Continue boiling for 2 min, and filter.

**Acceptance criteria:** The filtrate meets the requirements.

##### • B. IDENTIFICATION TESTS—GENERAL, Aluminum (191)

**Sample solution:** Wash the precipitate obtained in Identification test A with hot ammonium chloride solution (1 in 50), and dissolve the precipitate in hydrochloric acid.

**Acceptance criteria:** The solution meets the requirements.

#### ASSAY

##### • ALUMINUM HYDROXIDE

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.

**Sample solution:** Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 1200 mg of aluminum hydroxide, to a 150-mL beaker. Add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, and add water to volume.

**Analysis:** Pipet 10 mL of the *Sample solution* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling point for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate the excess edetate disodium with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of *Edetate disodium titrant* is equivalent to 3.900 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

Acceptance criteria: 90.0%–110.0%

• **MAGNESIUM HYDROXIDE**

**Sample solution:** Prepare as directed in the Assay for Aluminum Hydroxide.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 40 mg of magnesium hydroxide, into a 400-mL beaker. Add 200 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black TS in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol), and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 2.916 mg of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS**

• **DISINTEGRATION** (701)

**Time:** 10 min, simulated gastric fluid TS being substituted for water in the test

**Acceptance criteria:** Meet the requirements

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements for *Weight Variation* with respect to alumina and to magnesia

**SPECIFIC TESTS**

• **ACID-NEUTRALIZING CAPACITY** (301): The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq, and NLT the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (F_A \times A) + 0.8 \times (F_M \times M)$$

- $F_A$  = theoretical acid-neutralizing capacity of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , 0.0385 mEq  
 $A$  = amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  in the specimen tested, based on the labeled quantity (mg)  
 $F_M$  = theoretical acid-neutralizing capacity of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , 0.0343 mEq  
 $M$  = amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the specimen tested, based on the labeled quantity (mg)

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Tablets prepared with the use of Dried Aluminum Hydroxide Gel may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

## Alumina, Magnesia, and Calcium Carbonate Oral Suspension

**DEFINITION**

Alumina, Magnesia, and Calcium Carbonate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and calcium carbonate  $(\text{CaCO}_3)$ .

**IDENTIFICATION**

• **A. IDENTIFICATION TESTS—GENERAL, Calcium** (191)

**Sample solution:** To 5 g of Oral Suspension add 25 mL of 2 N sulfuric acid, stir, and allow to stand for 5 min. Add 25 mL of alcohol, stir, and place in an ice bath for 30 min. Filter while cold, retaining the filtrate for *Identification test B*. Wash the precipitate with 50 mL of 0.75 N sulfuric acid, and discard the washings. Dissolve the precipitate in 3 N hydrochloric acid, filter, and use the filtrate.

**Acceptance criteria:** Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL, Aluminum** (191)

**Sample solution:** To the filtrate obtained in *Identification test A*, add 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, continue boiling for 2 min, and filter through hardened filter paper. (Retain the filtrate for *Identification test C*.) Wash the precipitate with 350 mL of a hot solution containing 20 mg/mL of ammonium chloride, discarding the washings. Dissolve the precipitate so obtained in 3 N hydrochloric acid.

**Acceptance criteria:** Meets the requirements

• **C. IDENTIFICATION TESTS—GENERAL, Magnesia** (191)

**Sample solution:** The filtrate obtained in *Identification test B*.

**Acceptance criteria:** Meets the requirements

**ASSAY**

• **ALUMINUM HYDROXIDE**

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar* (0.05 M).

**Sample solution:** Transfer an amount of Oral Suspension, previously shaken in its original container, equivalent to 600 mg of aluminum hydroxide, to a tared beaker, and weigh. Add 20 mL of water, stir, and slowly add 40 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and transfer to a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the flask, and add water to volume.

**Analysis:** Pipet 10 mL of the *Sample solution* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 min. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate the excess edetate disodium with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of *Edetate disodium titrant* consumed is equivalent to 3.900 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Acceptance criteria:** 90.0%–110.0%

• **MAGNESIUM HYDROXIDE**

**Sample solution:** Prepare as directed in the Assay for Aluminum Hydroxide.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 40 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethanolamine, and mix. Add 50 mL of ammonia–ammonium chloride buffer TS and 2 drops of an eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mixing). Cool the solution to between 3° and 4° by immersing the beaker in an ice bath, and titrate with 0.05 M edetate disodium VS until the color changes to pure blue. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. From the volume of 0.05 M edetate disodium consumed, subtract the volume of 0.05 M edetate disodium consumed in the Assay for Calcium Carbonate. Each mL of 0.05 M

edetate disodium is equivalent to 2.916 mg of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

Acceptance criteria: 90.0%–110.0%

#### • CALCIUM CARBONATE

**Sample solution:** Prepare as directed in the Assay for Aluminum Hydroxide.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 50 mg of calcium carbonate, into a 400-mL beaker, and add 200 mL of water, 5 mL of sodium hydroxide solution (1 in 2), and 250 mg of hydroxy naphthol blue. Stir with a magnetic stirrer, and titrate immediately with 0.05 M edetate disodium VS until the solution is distinctly blue. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of calcium carbonate ( $\text{CaCO}_3$ ).

Acceptance criteria: 90.0%–110.0%

#### IMPURITIES

##### • CHLORIDE AND SULFATE, Chloride (221)

**Sample solution:** Dissolve 5.0 g in 3 mL of nitric acid, add water to make 100 mL, and filter.

**Acceptance criteria:** NMT 0.14%; a 10.0-mL portion of the *Sample solution* shows no more chloride than corresponds to 1.0 mL of 0.020 N hydrochloric acid.

##### • CHLORIDE AND SULFATE, Sulfate (221)

**Sample solution:** Dissolve 5.0 g in 7 mL of 3 N hydrochloric acid, and gently heat. Cool, add water to make 250 mL, and filter.

**Acceptance criteria:** NMT 0.1%; a 20.0-mL portion of the *Sample solution* shows no more sulfate than corresponds to 0.40 mL of 0.020 N sulfuric acid.

##### • ARSENIC, Method I (211)

**Standard preparation:** Prepare as directed in *Arsenic* (211), except prepare it to contain 5  $\mu\text{g}$  of arsenic instead of 3  $\mu\text{g}$ .

**Test preparation:** Dissolve a portion of Oral Suspension, equivalent to 0.5 g of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , in 20 mL of 7 N sulfuric acid.

**Acceptance criteria:** NMT 10 ppm, based on the aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  content

#### Delete the following:

##### • HEAVY METALS (231)

**Test preparation:** Dissolve a portion of Oral Suspension, equivalent to 0.24 g of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , in 10 mL of 3 N hydrochloric acid with the aid of heat, filter, if necessary, and dilute with water to 25 mL.

**Acceptance criteria:** NMT 83 ppm, based on the aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  content. (Official 1-Jan-2018)

#### SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** Its total aerobic microbial count does not exceed  $10^2$  cfu/mL, and it meets the requirements of the test for the absence of *Escherichia coli*.

• **pH (791):** 7.5–8.5

##### • ACID-NEUTRALIZING CAPACITY (301)

**Acceptance criteria:** The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq, and NLT the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (F_A \times A) + 0.8 \times (F_M \times M) + 0.9 \times (F_C \times C)$$

$F_A$  = theoretical acid-neutralizing capacity of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , 0.0385 mEq

$A$  = amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  in the specimen tested, based on the labeled quantity (mg)

$F_M$  = theoretical acid-neutralizing capacity of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , 0.0343 mEq

$M$  = amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the specimen tested, based on the labeled quantity (mg)

$F_C$  = theoretical acid-neutralizing capacity of calcium carbonate ( $\text{CaCO}_3$ ), 0.02 mEq

$C$  = amount of calcium carbonate ( $\text{CaCO}_3$ ) in the specimen tested, based on the labeled quantity (mg)

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid freezing.

• **LABELING:** Oral Suspension may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

## Alumina, Magnesia, and Calcium Carbonate Chewable Tablets

#### DEFINITION

Alumina, Magnesia, and Calcium Carbonate Chewable Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and calcium carbonate ( $\text{CaCO}_3$ ).

#### IDENTIFICATION

##### • A. IDENTIFICATION TESTS—GENERAL, Calcium (191)

**Sample solution:** To 3 g of finely powdered Chewable Tablets add 25 mL of water and 25 mL of 2 N sulfuric acid, stir, and heat on a steam bath for 10 min. Cool, add 50 mL of alcohol, stir, and place in an ice bath for 30 min. Filter while cold, retaining the filtrate for *Identification test B*. Wash the precipitate with 50 mL of 0.75 N sulfuric acid, and discard the washings. Dissolve the precipitate in 3 N hydrochloric acid, filter, and use the filtrate.

**Acceptance criteria:** Meet the requirements

##### • B. IDENTIFICATION TESTS—GENERAL, Aluminum (191)

**Sample solution:** To the filtrate obtained in *Identification test A* add 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, continue boiling for 2 min, and filter through hardened filter paper. (Retain the filtrate for *Identification test C*.) Wash the precipitate with 350 mL of a hot solution containing 20 mg/mL of ammonium chloride, discarding the washings. Dissolve the precipitate so obtained in 3 N hydrochloric acid.

**Acceptance criteria:** Meet the requirements

##### • C. IDENTIFICATION TESTS—GENERAL, Magnesium (191)

**Sample solution:** The filtrate obtained in *Identification test B*

**Acceptance criteria:** Meet the requirements

#### ASSAY

##### • ALUMINUM HYDROXIDE

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.

**Sample solution:** Weigh and finely powder NLT 20 Chewable Tablets. Transfer a portion of the powder, equivalent to 600 mg of aluminum hydroxide, to a beaker, add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid, with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume.

**Analysis:** Pipet 10 mL of the *Sample solution* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of

*Eдетate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate the excess edetate disodium with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of *Eдетate disodium titrant* consumed is equivalent to 3.900 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Acceptance criteria:** 90.0%–110.0%

#### • MAGNESIUM HYDROXIDE

**Sample solution:** Prepare as directed in the Assay for *Aluminum Hydroxide*.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 40 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethylamine, and mix. Add 50 mL of ammonia–ammonium chloride buffer TS and 2 drops of an eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethylamine and 5 mL of dehydrated alcohol, and mixing). Cool the solution to between 3° and 4° by immersing the beaker in an ice bath, and titrate with 0.05 M edetate disodium VS until the color changes to pure blue. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. From the volume of 0.05 M edetate disodium consumed, subtract the volume of 0.05 M edetate disodium consumed in the Assay for *Calcium Carbonate*. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

**Acceptance criteria:** 90.0%–110.0%

#### • CALCIUM CARBONATE

**Sample solution:** Prepare as directed in the Assay for *Aluminum Hydroxide*.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 50 mg of calcium carbonate, into a 400-mL beaker, and add 200 mL of water, 5 mL of sodium hydroxide solution (1 in 2), and 250 mg of hydroxy naphthol blue. Stir with a magnetic stirrer, and titrate immediately with 0.05 M edetate disodium VS until the solution is distinctly blue. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of calcium carbonate  $(\text{CaCO}_3)$ .

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISINTEGRATION (701)

**Time:** 45 min

**Acceptance criteria:** Meet the requirements

#### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements for *Weight Variation* with respect to aluminum hydroxide, to magnesium hydroxide, and to calcium carbonate.

### SPECIFIC TESTS

#### • ACID-NEUTRALIZING CAPACITY (301)

**Acceptance criteria:** The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq, and NLT the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (F_A \times A) + 0.8 \times (F_M \times M) + 0.9 \times (F_C \times C)$$

$F_A$  = theoretical acid-neutralizing capacity of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , 0.0385 mEq

$A$  = amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  in the specimen tested, based on the labeled quantity (mg)

$F_M$  = theoretical acid-neutralizing capacity of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , 0.0343 mEq

$M$  = amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the specimen tested, based on the labeled quantity (mg)

$F_C$  = theoretical acid-neutralizing capacity of calcium carbonate  $(\text{CaCO}_3)$ , 0.02 mEq

$C$  = amount of calcium carbonate  $(\text{CaCO}_3)$  in the specimen tested, based on the labeled quantity (mg)

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **LABELING:** Label the Chewable Tablets to indicate that they are to be chewed before being swallowed. Chewable Tablets prepared using dried aluminum hydroxide gel may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

## Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets

### DEFINITION

Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and calcium carbonate  $(\text{CaCO}_3)$ , and an amount of polydimethylsiloxane  $([-(\text{CH}_3)_2\text{SiO}-]_n)$  that is NLT 85.0% and NMT 115.0% of the labeled amount of simethicone.

### IDENTIFICATION

#### • A. IDENTIFICATION TESTS—GENERAL, Calcium (191)

**Sample solution:** Cut a Chewable Tablet into pieces, add 50 mL of 1 N sulfuric acid, stir until the pieces disintegrate, and heat on a steam bath for 10 min. Cool, add 50 mL of alcohol, and stir. Place in an ice bath for 30 min. Filter while cold, retaining the filtrate for *Identification test B*. Wash the precipitate with 50 mL of 0.75 N sulfuric acid, and discard the washings. Dissolve the precipitate in 3 N hydrochloric acid, filter, and use the filtrate.

**Acceptance criteria:** Meet the requirements

#### • B. IDENTIFICATION TESTS—GENERAL, Aluminum (191)

**Sample solution:** To the filtrate obtained in *Identification test A*, add 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, continue boiling for 2 min, and filter through hardened filter paper. (Retain the filtrate for *Identification test C*.) Wash the precipitate with 350 mL of a hot solution containing 20 mg/mL of ammonium chloride, discarding the washings. Dissolve the precipitate so obtained in 3 N hydrochloric acid.

**Acceptance criteria:** Meet the requirements

#### • C. IDENTIFICATION TESTS—GENERAL, Magnesium (191)

**Sample solution:** The filtrate obtained in *Identification test B*

**Acceptance criteria:** Meet the requirements

#### • D. INFRARED ABSORPTION (197S)

**Sample solution:** Prepare as directed in the Assay for *Polydimethylsiloxane*.

**Analysis:** Proceed as directed using a 0.5-mm cell.

**Acceptance criteria:** Meet the requirements

### ASSAY

#### • ALUMINUM HYDROXIDE

**Eдетate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Eдетate Disodium, Twentieth-Molar (0.05 M)*.

**Sample solution:** Transfer a number of Chewable Tablets, equivalent of about 665 mg of aluminum hydroxide, to a suitable beaker. Add 15 mL of hydrochloric acid, and swirl to dissolve the Chewable Tablets. Add 80 mL of water, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, and add water to volume.

**Analysis:** Pipet 20 mL of the *Sample solution* into a 250-mL beaker, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the excess edetate disodium with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 mL of water for the *Sample solution*, and make any necessary correction. Each mL of *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

**Acceptance criteria:** 90.0%–110.0%

#### • MAGNESIUM HYDROXIDE

**Lanthanum chloride solution:** Transfer 17.6 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Allow to cool, and dilute with water to volume.

**Dilute hydrochloric acid:** Dilute 226 mL of hydrochloric acid to 1000 mL with water.

**Potassium chloride solution:** 30 mg/mL in water

**Magnesium stock solution:** Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 10 mL of water, slowly add 10 mL of hydrochloric acid, and swirl to dissolve the metal. Dilute with water to volume. Transfer 1.0 mL of this solution to a 100-mL volumetric flask to obtain a solution containing 10 µg/mL of magnesium (Mg).

**Standard solutions:** To three separate 100-mL volumetric flasks each containing 5.0 mL of *Lanthanum chloride solution*, add 1.0, 2.0, and 3.0 mL, respectively, of the *Magnesium stock solution*. Dilute each with water to volume. These solutions contain 0.1, 0.2, and 0.3 µg/mL of magnesium (Mg), respectively.

**Sample stock solution:** Transfer a number of Chewable Tablets, equivalent of 250 mg of magnesium hydroxide (100 mg of magnesium), to a 1000-mL volumetric flask. Add 500 mL of *Dilute hydrochloric acid*, and swirl to dissolve the Chewable Tablets. Add 100.0 mL of *Potassium chloride solution*, and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 2.0 mL of *Sample stock solution* to a second 100-mL volumetric flask, add 5.0 mL of *Lanthanum chloride solution*, and dilute with water to volume.

**Blank:** Add 50 mL of *Dilute hydrochloric acid* and 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, and dilute with water to volume. Transfer 2.0 mL of this solution to a third 100-mL volumetric flask, add 5.0 mL of *Lanthanum chloride solution*, and dilute with water to volume.

**Analysis:** Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a magnesium hollow-cathode lamp and an air–acetylene flame, using the *Blank* to set the instrument. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of magnesium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration,  $C$ , in µg/mL, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the portion of Tablets taken:

$$\text{Result} = (C/C_u) \times (M_r/A_r) \times 100$$

$C$  = concentration of magnesium in the *Sample solution*, as determined above (µg/mL)

$C_u$  = nominal concentration of magnesium hydroxide in the *Sample solution* (µg/mL)

$M_r$  = molecular weight of magnesium hydroxide, 58.34

$A_r$  = atomic weight of magnesium, 24.305

**Acceptance criteria:** 90.0%–110.0%

#### • CALCIUM CARBONATE

**Sample solution:** Transfer a number of Chewable Tablets, equivalent of about 665 mg of aluminum hydroxide, to a suitable beaker. Add 15 mL of hydrochloric acid, and swirl to dissolve the Chewable Tablets. Add 80 mL of water, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, and add water to volume.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 50 mg of calcium carbonate, into a 400-mL beaker, and add 200 mL of water, a volume of sodium hydroxide solution (1 in 2) equivalent to the volume of the *Sample solution* taken, and 250 mg of hydroxy naphthol blue. Stir with a magnetic stirrer, and titrate immediately with 0.05 M edetate disodium VS until the solution is distinctly blue. Perform a blank determination, substituting a volume of water equivalent to the volume of the *Sample solution* taken, and make any necessary correction. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of calcium carbonate ( $\text{CaCO}_3$ ).

**Acceptance criteria:** 90.0%–110.0%

#### • POLYDIMETHYLSILOXANE

**Dilute hydrochloric acid:** Dilute 400 mL of hydrochloric acid with sufficient water to make 1000 mL.

**Standard solution:** Transfer 60 mg of USP

Polydimethylsiloxane RS to a separator, add 30.0 mL of chloroform and 60 mL of *Dilute hydrochloric acid*, shake for 30 s, and allow the phases to separate. Remove 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture to obtain a clear supernatant.

**Sample solution:** Weigh and finely powder NLT 20 Chewable Tablets. Transfer a portion of the powder, equivalent of 60 mg of simethicone, to a suitable screw-capped bottle. Add 30.0 mL of chloroform and 60 mL of *Dilute hydrochloric acid*, and allow to stand, with frequent shaking, until the Chewable Tablets are dissolved. Transfer the contents of the bottle to a separator, shake, and allow the phases to separate. Remove 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture to obtain a clear supernatant.

**Blank:** Place 30.0 mL of chloroform and 60 mL of *Dilute hydrochloric acid* in a separator, shake for 30 s, and allow the phases to separate. Remove 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap that has an inert liner, agitate vigorously, and centrifuge the mixture to obtain a clear supernatant.

**Analysis:** Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution* in 0.5-mm cells at the wavelength of maximum absorbance at about 7.9 µm, with a suitable IR spectrophotometer, using the *Blank* to set the instrument.

Calculate the percentage of polydimethylsiloxane  $[(\text{CH}_3)_2\text{SiO}]_n$  in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (W_S/W_U) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $W_S$  = weight of USP Polydimethylsiloxane RS taken to prepare the *Standard solution* (mg)  
 $W_U$  = nominal amount of simethicone in the portion of the Tablets taken to prepare the *Sample solution* (mg)

Acceptance criteria: 85.0%–115.0%

## PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation* with respect to aluminum hydroxide, to magnesium hydroxide, and to calcium carbonate.

## SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count is NMT  $2 \times 10^2$  cfu/g, the total combined molds and yeasts count is NMT  $2 \times 10^2$  cfu/g, and the Chewable Tablets meet the requirements of the test for the absence of *Salmonella* species and *Escherichia coli*.

## ACID-NEUTRALIZING CAPACITY (301)

**Sample solution:** Dissolve an accurately counted number of Chewable Tablets, equivalent to about 120 mEq of acid-neutralizing capacity, in 400 mL of water. Transfer the mixture to a 500-mL volumetric flask, and dilute with water to volume.

**Analysis:** Proceed as directed in the section *Procedure for Powders, Effervescent Solids, Suspensions and Other Liquids, Lozenges Nonchewable Tablets, Chewable Tablets, and Capsules* using 75.0 mL of the *Sample solution*.

**Acceptance criteria:** The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq, and NLT the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (F_A \times A) + 0.8 \times (F_M \times M) + 0.9 \times (F_C \times C)$$

- $F_A$  = theoretical acid-neutralizing capacity of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , 0.0385 mEq  
 $A$  = amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  in the specimen tested, based on the labeled quantity (mg)  
 $F_M$  = theoretical acid-neutralizing capacity of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , 0.0343 mEq  
 $M$  = amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the specimen tested, based on the labeled quantity (mg)  
 $F_C$  = theoretical acid-neutralizing capacity of calcium carbonate  $(\text{CaCO}_3)$ , 0.02 mEq  
 $C$  = amount of calcium carbonate  $(\text{CaCO}_3)$  in the specimen tested, based on the labeled quantity (mg)

## SODIUM CONTENT

**Potassium chloride solution:** 30 mg/mL of potassium chloride

**Dilute hydrochloric acid:** Dilute 226 mL of hydrochloric acid with sufficient water to make 1000 mL.

**Standard stock solution:** Transfer 2.5420 g of sodium chloride, previously dried at  $105^\circ$  for 2 h, to a 1000-mL volumetric flask, and dissolve in and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, and dilute with water to volume.

**Standard solutions:** To three separate 100-mL volumetric flasks, each containing 10.0 mL of *Potassium chloride*

*solution* and 3.0 mL of *Dilute hydrochloric acid*, add 10.0, 20.0, and 30.0 mL, respectively, of the *Standard stock solution*. The resulting *Standard solutions* contain 1.0, 2.0, and 3.0  $\mu\text{g/mL}$  of sodium (Na), respectively.

**Sample stock solution:** Weigh 10 Chewable Tablets, and determine the average weight,  $A$ , in mg. Cut 4 Chewable Tablets into pieces, combine the pieces, and weigh them. Transfer the combined pieces to a 500-mL volumetric flask, add 150 mL of *Dilute hydrochloric acid*, and swirl gently to dissolve the pieces. Dilute with water to volume.

**Sample solution:** Transfer 10.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, add 10.0 mL of *Potassium chloride solution*, and dilute with water to volume.

**Blank solution:** Combine 3.0 mL of *Dilute hydrochloric acid* and 10.0 mL of *Potassium chloride solution* in a 100-mL volumetric flask, and dilute with water to volume.

## Analysis

**Samples:** *Standard solution* and *Sample solution*

Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard solutions* versus concentration, in  $\mu\text{g/mL}$ , of sodium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration,  $C$ , in  $\mu\text{g/mL}$ , of sodium in the *Sample solution*.

Calculate the quantity, in mg, of sodium (Na) in each Chewable Tablet taken:

$$\text{Result} = (A/W) \times C \times D \times F$$

- $A$  = average weight of each Tablet (mg)  
 $W$  = weight of the portion of Chewable Tablets taken to prepare the *Sample solution* (mg)  
 $C$  = concentration of sodium in the *Sample solution* ( $\mu\text{g/mL}$ )  
 $D$  = dilution factor for the *Sample solution*, 5000  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$

**Acceptance criteria:** Chewable Tablets contain NMT 5 mg/Tablet of sodium, except when labeled as containing more than 5 mg/Tablet of sodium; then they contain NMT 110% of the labeled amount.

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers.
- LABELING:** The labeling indicates that the Chewable Tablets are to be chewed before swallowing. Label the Chewable Tablets to state the sodium content, if it is greater than 5 mg/Chewable Tablet.
- USP REFERENCE STANDARDS (11)**  
USP Polydimethylsiloxane RS

## Alumina, Magnesia, and Simethicone Oral Suspension

### DEFINITION

Alumina, Magnesia, and Simethicone Oral Suspension contains the equivalent of NLT 90.0% and NMT 115.0% of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and an amount of polydimethylsiloxane  $[(\text{CH}_3)_2\text{SiO}]_n$  that is NLT 85.0% and NMT 115.0% of the labeled amount of simethicone.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197S)

**Sample solution:** Prepare as directed in the Assay for Polydimethylsiloxane.

**Analysis:** Proceed as directed using a 0.5-mm cell.

**Acceptance criteria:** Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL, Magnesium** (191)

**Sample solution:** Add 5 g of Oral Suspension to 10 mL of 3 N hydrochloric acid, then add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution just changes to deep yellow, then continue boiling for 2 min, and filter.

**Acceptance criteria:** Meets the requirements

• **C. IDENTIFICATION TESTS—GENERAL, Aluminum** (191)

**Sample solution:** Wash the precipitate from Identification test B with hot ammonium chloride solution (1 in 50), and dissolve the precipitate in hydrochloric acid. Divide this solution into two portions.

**Analysis 1:** Add, dropwise, 6 N ammonium hydroxide to one portion of the *Sample solution*.

**Acceptance criteria 1:** A gelatinous white precipitate, which does not dissolve in an excess of 6 N ammonium hydroxide, is obtained.

**Analysis 2:** Add, dropwise, 1 N sodium hydroxide to the second portion of the *Sample solution*.

**Acceptance criteria 2:** A gelatinous white precipitate, which dissolves in an excess of 1 N sodium hydroxide, leaving some turbidity, is obtained.

**ASSAY**• **ALUMINUM HYDROXIDE**

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar* (0.05 M).

**Sample solution:** Transfer a measured amount of Oral Suspension, previously well shaken in its original container, equivalent to 800 mg of aluminum hydroxide, to a suitable beaker. Add 20 mL of water, stir, and slowly add 10 mL of hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, and add water to volume.

**Analysis:** Pipet 10 mL of the *Sample solution* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the excess edetate disodium with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of *Edetate disodium titrant* consumed is equivalent to 3.900 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Acceptance criteria:** 90.0%–115.0%

• **MAGNESIUM HYDROXIDE**

**Sample solution:** Prepare as directed in the Assay for Aluminum Hydroxide.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 40 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mixing). Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting water for the *Sample solution*, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 2.916 mg of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

**Acceptance criteria:** 90.0%–115.0%

• **POLYDIMETHYLSILOXANE**

**Standard solution:** Prepare similarly to the *Sample solution* below, except dissolve 50 mg of USP Polydimethylsiloxane RS in 25.0 mL of toluene, add 40 mL of 0.1 N sodium hydroxide, and add a volume of water equal to that of the specimen of Oral Suspension taken for the *Sample solution*.

**Sample solution:** Transfer an amount of Oral Suspension, equivalent to 50 mg of simethicone, to a suitable round, narrow-mouth, screw-capped, 120-mL bottle, add 40 mL of 0.1 N sodium hydroxide, and swirl to disperse. Add 25.0 mL of toluene, close the bottle securely with a cap having an inert liner, and shake for 15 min on a reciprocating shaker (e.g., about 200 oscillations/min and a stroke of  $38 \pm 2$  mm). Transfer the mixture to a 125-mL separator. Remove about 5 mL of the upper, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

**Blank:** Mix 10 mL of toluene with 0.5 g of anhydrous sodium sulfate, and centrifuge to obtain a clear supernatant.

**Analysis:** Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution* in 0.5-mm cells at the wavelength of maximum absorbance at about 7.9  $\mu\text{m}$ , with a suitable IR spectrophotometer, using the *Blank* to set the instrument.

Calculate the percentage of polydimethylsiloxane  $[(\text{--}(\text{CH}_3)_2\text{SiO--})_n]$  in the portion of Oral Suspension taken:

$$\text{Result} = (A_U/A_S) \times (W_S/W_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$W_S$  = weight of USP Polydimethylsiloxane RS taken to prepare the *Standard solution* (mg)

$W_U$  = nominal amount of simethicone in the portion of the Oral Suspension taken to prepare the *Sample solution* (mg)

**Acceptance criteria:** 85.0%–115.0%

**SPECIFIC TESTS**

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count is NMT  $10^2$  cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.

• **ACID-NEUTRALIZING CAPACITY** (301)

**Acceptance criteria:** The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq, and NLT the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (F_A \times A) + 0.8 \times (F_M \times M)$$

$F_A$  = theoretical acid-neutralizing capacity of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , 0.0385 mEq

$A$  = amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  in the specimen tested, based on the labeled quantity (mg)

$F_M$  = theoretical acid-neutralizing capacity of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , 0.0343 mEq

$M$  = amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the specimen tested, based on the labeled quantity (mg)

• **PH** (791): 7.0–8.6• **SODIUM CONTENT**

**Potassium chloride solution:** 38 mg/mL of potassium chloride

**Sodium chloride stock solution:** 25.42 µg/mL of sodium chloride (previously dried at 105° for 2 h) in water. The solution contains 10 µg/mL of sodium.

**Standard solutions:** On the day of use, transfer 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* to each of two 100-mL volumetric flasks. To the respective flasks add 5.0 and 10.0 mL of *Sodium chloride stock solution*. Dilute with water to volume. The resulting *Standard solutions* contain 0.5 and 1.0 µg/mL of sodium (Na), respectively.

**Sample solution:** Transfer 5.0 mL of Oral Suspension, previously well shaken in its original container, to a 100-mL volumetric flask. Add 50 mL of 1 N hydrochloric acid, boil for 15 min, cool to room temperature, and dilute with water to volume. Filter, discarding the first few mL of the filtrate. Transfer 5.0 mL of the filtrate to a 100-mL volumetric flask containing 10.0 mL of *Potassium chloride solution*, and dilute with water to volume.

**Blank solution:** Combine 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* in a 100-mL volumetric flask, and dilute with water to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of sodium, and draw a straight line between the plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of sodium in the *Sample solution*.

Calculate the quantity, in mg, of sodium (Na) in each mL of Oral Suspension taken:

$$\text{Result} = (1/N) \times C \times D \times F$$

- N* = volume of the Oral Suspension taken to prepare the *Sample solution*, 5.0 mL  
*C* = concentration of sodium in the *Sample solution* (µg/mL)  
*D* = dilution factor for the *Sample solution*, 2000  
*F* = conversion factor, 0.001 mg/µg

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid freezing.
- **LABELING:** Oral Suspension may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of aluminum hydroxide [Al(OH)<sub>3</sub>]. Label it to state the sodium content if it is greater than 1 mg/mL.
- **USP REFERENCE STANDARDS (11)**  
 USP Polydimethylsiloxane RS

## Alumina, Magnesia, and Simethicone Chewable Tablets

#### DEFINITION

Alumina, Magnesia, and Simethicone Chewable Tablets contain the equivalent of NLT 90.0% and NMT 115.0% of the labeled amounts of aluminum hydroxide [Al(OH)<sub>3</sub>] and magnesium hydroxide [Mg(OH)<sub>2</sub>], and an amount of polydimethylsiloxane [(—(CH<sub>3</sub>)<sub>2</sub>SiO—)<sub>n</sub>] that is NLT 85.0% and NMT 115.0% of the labeled amount of simethicone.

#### IDENTIFICATION

##### • A. INFRARED ABSORPTION (197S)

**Sample solution:** Prepare as directed in the Assay for *Polydimethylsiloxane*.

**Analysis:** Proceed as directed using a 0.5-mm cell.

**Acceptance criteria:** Meet the requirements

##### • B. IDENTIFICATION TESTS—GENERAL, Magnesium (191)

**Sample solution:** To a portion of finely powdered Chewable Tablets, equivalent to 600 mg of magnesium hydroxide, add 25 mL of 3 N hydrochloric acid and 25 mL of water, and mix. Boil gently for 2 min. Allow to cool, and filter. Add 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution just turns to deep yellow. Continue boiling for 2 min, and filter.

**Acceptance criteria:** Meet the requirements

##### • C. IDENTIFICATION TESTS—GENERAL, Aluminum (191)

**Sample solution:** Wash the precipitate from *Identification test B* with hot ammonium chloride solution (1 in 50), and dissolve the precipitate in hydrochloric acid. Divide this solution into two portions.

**Analysis 1:** Add, dropwise, 6 N ammonium hydroxide to one portion of the *Sample solution*.

**Acceptance criteria 1:** A gelatinous white precipitate, which does not dissolve in an excess of 6 N ammonium hydroxide, is obtained.

**Analysis 2:** Add, dropwise, 1 N sodium hydroxide to the second portion of the *Sample solution*.

**Acceptance criteria 2:** A gelatinous white precipitate, which dissolves in an excess of 1 N sodium hydroxide, leaving some turbidity, is obtained.

#### ASSAY

##### • ALUMINUM HYDROXIDE

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.

**Sample solution:** Weigh and finely powder NLT 20 Chewable Tablets. Transfer a portion of the powder, equivalent of 800 mg of aluminum hydroxide, to a 150-mL beaker. Add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool to room temperature, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, and add water to volume.

**Analysis:** Pipet 10 mL of the *Sample solution* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the excess edetate disodium with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of *Edetate disodium titrant* consumed is equivalent to 3.900 mg of aluminum hydroxide [Al(OH)<sub>3</sub>].

**Acceptance criteria:** 90.0%–115.0%

##### • MAGNESIUM HYDROXIDE

**Sample solution:** Prepare as directed in the Assay for *Aluminum Hydroxide*.

**Analysis:** Pipet a volume of the *Sample solution*, equivalent to 40 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mixing). Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting water for the *Sample solution*, and make any necessary correction.

Each mL of 0.05 M edetate disodium consumed is equivalent to 2.916 mg of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

Acceptance criteria: 90.0%–115.0%

#### • POLYDIMETHYLSILOXANE

**Standard solution:** Prepare similarly to the *Sample solution* below, using 33 mg of USP Polydimethylsiloxane RS.

**Sample solution:** Weigh and finely powder NLT 20 Chewable Tablets. Transfer a portion of the powder, equivalent of 33 mg of simethicone, to a suitable round, narrow-mouth, screw-capped, 120-mL bottle. Add 40 mL of 0.1 N sodium hydroxide, and swirl to disperse. Add 20.0 mL of toluene, close the bottle securely with a cap having an inert liner, and shake for 30 min on a reciprocating shaker (e.g., 200 oscillations/min and a stroke of  $38 \pm 2$  mm). Transfer the mixture to a 125-mL separator, and allow to separate. Remove the upper, organic layer to a screw-capped, centrifuge tube containing 2 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

**Blank:** Mix 10 mL of toluene with 1 g of anhydrous sodium sulfate, and centrifuge to obtain a clear supernatant.

**Analysis:** Concomitantly determine the absorbances of the *Standard solution* and *Sample solution* in 0.5-mm cells at the wavelength of maximum absorbance at about  $7.9 \mu\text{m}$  ( $1265.8 \text{ cm}^{-1}$ ), with a suitable IR spectrophotometer, using the *Blank* to set the instrument. Calculate the percentage of polydimethylsiloxane  $[(\text{--}(\text{CH}_3)_2\text{SiO--})_n]$  in the portion of Chewable Tablets taken:

$$\text{Result} = (A_U/A_S) \times (W_S/W_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$W_S$  = weight of USP Polydimethylsiloxane RS taken to prepare the *Standard solution* (mg)

$W_U$  = nominal amount of simethicone in the portion of the Chewable Tablets taken to prepare the *Sample solution* (mg)

Acceptance criteria: 85.0%–115.0%

#### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium hydroxide

#### SPECIFIC TESTS

- **ACID-NEUTRALIZING CAPACITY (301)**

Acceptance criteria: The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq, and NLT the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (F_A \times A) + 0.8 \times (F_M \times M)$$

$F_A$  = theoretical acid-neutralizing capacity of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , 0.0385 mEq

$A$  = amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  in the specimen tested, based on the labeled quantity (mg)

$F_M$  = theoretical acid-neutralizing capacity of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , 0.0343 mEq

$M$  = amount of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in the specimen tested, based on the labeled quantity (mg)

- **SODIUM CONTENT**

Potassium chloride solution: 38 mg/mL of potassium chloride

**Sodium chloride stock solution:** 25.42  $\mu\text{g/mL}$  of sodium chloride (previously dried at  $105^\circ$  for 2 h) in water. The solution contains 10  $\mu\text{g/mL}$  of sodium.

**Standard solutions:** On the day of use, transfer 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* to each of two 100-mL volumetric flasks. To the respective flasks add 5.0 and 10.0 mL of *Sodium chloride stock solution*. Dilute with water to volume. The resulting *Standard solutions* contain 0.5 and 1.0  $\mu\text{g/mL}$  of sodium (Na), respectively.

**Sample solution:** Weigh and finely powder NLT 20 Chewable Tablets. Transfer a portion of the powder, equivalent to the average weight of 1 Chewable Tablet, to a 100-mL volumetric flask. Add 50 mL of 1 N hydrochloric acid, boil for 15 min, cool to room temperature, and dilute with water to volume. Filter, discarding the first few mL of the filtrate. Transfer 5.0 mL of the filtrate to a 100-mL volumetric flask containing 10.0 mL of *Potassium chloride solution*, and dilute with water to volume.

**Blank solution:** Combine 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* in a 100-mL volumetric flask, and dilute with water to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard solutions* versus concentration, in  $\mu\text{g/mL}$ , of sodium, and draw a straight line between the plotted points. From the graph so obtained, determine the concentration,  $C$ , in  $\mu\text{g/mL}$ , of sodium in the *Sample solution*.

Calculate the quantity, in mg, of sodium (Na) in each Chewable Tablet taken:

$$\text{Result} = C \times D \times F$$

$C$  = concentration of sodium in the *Sample solution* ( $\mu\text{g/mL}$ )

$D$  = dilution factor for the *Sample solution*, 2000

$F$  = conversion factor, 0.001 mg/ $\mu\text{g}$

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label the Chewable Tablets to indicate that they are to be chewed before being swallowed. Label the Chewable Tablets to state the sodium content if it is greater than 5 mg/Tablet. The Chewable Tablets may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .
- **USP REFERENCE STANDARDS (11)**  
USP Polydimethylsiloxane RS

### Alumina and Magnesium Carbonate Oral Suspension

» Alumina and Magnesium Carbonate Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of

the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium carbonate ( $\text{MgCO}_3$ ).

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

**Identification**—

**A:** Place about 1 g in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** To a solution of 5 g in 10 mL of 3 N hydrochloric acid add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**C:** Wash the precipitate obtained in *Identification* test B with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution responds to the tests for *Aluminum* (191).

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*, *Salmonella* species, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*.

**Acid-neutralizing capacity (301)**—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.024M)$$

in which 0.0385 and 0.024 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$  and  $\text{MgCO}_3$ , respectively; and A and M are the respective quantities, in mg, of  $\text{Al}(\text{OH})_3$  and  $\text{MgCO}_3$  in the specimen tested, based on the labeled quantities.

**pH (791):** between 7.5 and 9.5.

**Assay for aluminum hydroxide**—

**Potassium chloride solution**—Prepare a solution containing 4.5 g of potassium chloride in each 100 mL.

**Aluminum stock solution**—Transfer 1.000 g of aluminum wire to a 1000-mL volumetric flask, and add 50 mL of 6 N hydrochloric acid. Swirl to ensure contact of the aluminum and the acid, and allow the reaction to proceed until all of the aluminum has dissolved. Dilute with water to volume, and mix.

**Standard preparations**—To separate 100-mL volumetric flasks, each containing 10 mL of *Potassium chloride solution*, transfer 9.0, 10.0, and 11.0 mL, respectively, of *Aluminum stock solution*, dilute with water to volume, and mix. These *Standard preparations* contain 90.0, 100.0, and 110.0  $\mu\text{g}$  of aluminum per mL, respectively.

**Assay preparation**—Transfer an accurately measured quantity of Oral Suspension, previously shaken in its original container, equivalent to about 75 mg of aluminum hydroxide, to a suitable beaker. Add 25 mL of 6 N hydrochloric acid, and heat on a steam bath for 30 minutes, with occasional swirling. Cool, and transfer with the aid of water to a 250-mL volumetric flask containing 25 mL of *Potassium chloride solution*. Dilute with water to volume, mix, and filter.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the aluminum emission line at 309.3 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with an aluminum hollow-cathode lamp and a nitrous oxide-acetylene flame, using water as

the blank. Calculate the quantity, in mg, of  $\text{Al}(\text{OH})_3$  in the portion of Oral Suspension taken by the formula:

$$(78.00 / 26.98)(0.25)(A_U / R_S)$$

in which 78.00 is the molecular weight of aluminum hydroxide; 26.98 is the atomic weight of aluminum;  $A_U$  is the absorbance of the *Assay preparation*; and  $R_S$  is the average of the ratios of the absorbances of the *Standard preparations* to their respective concentrations, in  $\mu\text{g}$  of aluminum per mL.

**Assay for magnesium carbonate**—

**Lanthanum chloride solution**—Prepare a solution of lanthanum chloride in water containing 5 mg per mL.

**Magnesium stock solution**—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 50 mL of water, and slowly add 10 mL of hydrochloric acid. Dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparations**—To separate 100-mL volumetric flasks, each containing 10 mL of *Lanthanum chloride solution*, transfer 1.70 mL and 1.80 mL, respectively, of *Magnesium stock solution*, dilute with water to volume, and mix. These *Standard preparations* contain 1.7  $\mu\text{g}$  of magnesium per mL and 1.8  $\mu\text{g}$  of magnesium per mL, respectively.

**Assay preparation**—Quantitatively dilute an accurately measured volume of the *Assay preparation* prepared as directed in the *Assay for aluminum hydroxide* with water to obtain a solution having a concentration of about 6  $\mu\text{g}$  of magnesium carbonate per mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a magnesium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Calculate the quantity, in mg, of magnesium carbonate ( $\text{MgCO}_3$ ) in the portion of Oral Suspension taken by the formula:

$$(84.31 / 24.31)(L / D)(A_U / R_S)$$

in which 84.31 is the molecular weight of magnesium carbonate; 24.31 is the atomic weight of magnesium; L is the labeled quantity, in mg, of magnesium carbonate in the portion of Oral Suspension taken; D is the concentration, in  $\mu\text{g}$  of magnesium carbonate per mL, of the *Assay preparation*, based on the labeled amount of magnesium carbonate in the portion of Oral Suspension taken and the extent of dilution;  $A_U$  is the absorbance of the *Assay preparation*; and  $R_S$  is the average of the ratios of the absorbances of the *Standard preparations* to their respective concentrations, in  $\mu\text{g}$  of magnesium per mL.

## Alumina and Magnesium Carbonate Tablets

» Alumina and Magnesium Carbonate Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium carbonate ( $\text{MgCO}_3$ ).

**Packaging and storage**—Preserve in tight containers.

**Identification**—

**A:** Place about 1 g of finely powdered Tablets in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately

insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** To a 7-g portion of finely powdered Tablets add 10 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution changes to deep yellow. Continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**C:** Wash the precipitate obtained in *Identification* test B with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution responds to the tests for *Aluminum* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium carbonate.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

#### Assay for aluminum hydroxide—

**Potassium chloride solution**—Prepare a solution containing 38.1 g of potassium chloride in each 1000 mL.

**Digestion fluid**—Mix 5 mL of hydrochloric acid, 10 mL of nitric acid, and 10 mL of water, and use promptly.

**Aluminum stock solution**—Transfer 1.000 g of aluminum metal to a 1000-mL volumetric flask, and add 50 mL of 6 N hydrochloric acid. Swirl to ensure contact of the aluminum and the acid, and allow the reaction to proceed until all of the aluminum has dissolved. Dilute with water to volume, and mix.

**Standard preparations**—To separate 100-mL volumetric flasks transfer 3.0 mL, 4.0 mL, and 5.0 mL of *Aluminum stock solution*, respectively. To each flask add 10 mL of *Potassium chloride solution* and 7.5 mL of *Digestion fluid*, dilute with water to volume, and mix. These *Standard preparations* contain 30, 40, and 50 µg of aluminum per mL, respectively.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 30 mg of aluminum hydroxide, to a 100-mL volumetric flask, add 25-mL of *Digestion fluid*, and heat on a steam bath for 30 minutes or on a hot plate until the volume is reduced by about one-half. Cool, dilute with water to volume, and mix. Filter, discarding the first 20 mL of the filtrate. Transfer 15.0 mL of the filtrate to a 50-mL volumetric flask, add 5.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix. [NOTE—Reserve a portion of the filtrate for use in the *Assay for magnesium carbonate*.]

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the aluminum emission line at 309.3 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with an aluminum hollow-cathode lamp and a nitrous oxide-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of aluminum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C, in µg per mL, of aluminum in each mL of the *Assay preparation*. Calculate the quantity, in mg, of aluminum hydroxide [Al(OH)<sub>3</sub>] in the portion of Tablets taken by the formula:

$$(78.00 / 26.98)(C / 3)$$

in which 78.00 is the molecular weight of aluminum hydroxide, and 26.98 is the atomic weight of aluminum.

#### Assay for magnesium carbonate—

**Lanthanum chloride solution**—Transfer 17.6 g of lanthanum chloride to a 1000-mL volumetric flask, add 500 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume, and mix.

**Digestion fluid**—Mix 5 mL of hydrochloric acid, 10 mL of nitric acid, and 10 mL of water, and use promptly.

**Magnesium stock solution**—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 50 mL of water, and slowly add 10 mL of hydrochloric acid. Dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparations**—To separate 100-mL volumetric flasks transfer 4.0, 6.0, and 8.0 mL of *Magnesium stock solution*, respectively. To each flask add 0.5 mL of *Digestion fluid* and 10 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix. These *Standard preparations* contain 0.40, 0.60, and 0.80 µg of magnesium per mL, respectively.

**Assay preparation**—Transfer an accurately measured volume of the filtrate used to prepare the *Assay preparation* in the *Assay for aluminum hydroxide*, equivalent to about 0.4 mg of magnesium carbonate, to a 200-mL volumetric flask, add 20 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a magnesium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of magnesium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C, in µg per mL, of magnesium in each mL of the *Assay preparation*. Calculate the quantity, in mg, of magnesium carbonate (MgCO<sub>3</sub>) in the portion of Tablets taken by the formula:

$$(84.31 / 24.31)(20C / V)$$

in which 84.31 is the molecular weight of magnesium carbonate; 24.31 is the atomic weight of magnesium; and V is the volume taken, in mL, of the *Assay preparation* prepared as directed in the *Assay for aluminum hydroxide*.

## Alumina, Magnesium Carbonate, and Magnesium Oxide Tablets

» Alumina, Magnesium Carbonate, and Magnesium Oxide Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide [Al(OH)<sub>3</sub>] and magnesium carbonate (MgCO<sub>3</sub>), and not less than 85.0 percent and not more than 115.0 percent of the labeled amount of magnesium oxide (MgO).

**Packaging and storage**—Preserve in tight containers.

#### Identification—

**A:** Place about 3 g of finely powdered Tablets in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** To the solution in the flask obtained in *Identification* test A add 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, continue boiling for 2 minutes, and filter through hardened filter paper. (Retain the filtrate for *Identification* test C.) Wash the precipitate with 350 mL

of a hot ammonium chloride solution (1 in 50), discarding the washings: the precipitate so obtained, dissolved in 3 N hydrochloric acid, responds to the tests for *Aluminum* (191).

C: The filtrate obtained in *Identification* test B responds to the tests for *Magnesium* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to alumina, to magnesium carbonate, and to magnesium oxide.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

#### Assay for aluminum hydroxide—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1200 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

*Procedure*—Pipet 10 mL of the *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling point for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

**Assay for magnesium carbonate**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 750 mg of magnesium carbonate, to a 250-mL conical flask fitted with a two-hole stopper. Fill the lower transverse section of a U-shaped drying tube of about 15-mm internal diameter and 15-cm height with loosely packed glass wool. Place in one arm of the tube about 5 g of anhydrous calcium chloride, and accurately weigh the tube and the contents. Into the other arm of the tube place 9.5 g to 10.5 g of soda lime, and again weigh accurately. Insert stoppers in the open arms of the U-tube, and connect the side tube of the arm filled with soda lime to a calcium chloride drying tube, which in turn is connected to one of the holes in the stopper of the 250-mL conical flask. Attach a dropping funnel to the other hole in the stopper of the 250-mL conical flask. Add 100 mL of water and 10 mL of a mixture of hydrochloric acid and nitric acid (4:1) to the 250-mL conical flask through the dropping funnel, and close the dropping funnel. Heat the 250-mL conical flask at 95° for 1 hour, and allow the evolved carbon dioxide to pass through the U-tube. Replace the dropping funnel with a source of carbon dioxide-free air, and pass the carbon dioxide-free air through the apparatus at a rate of about 75 mL per minute for 30 minutes. Disconnect the U-tube, cool to room temperature, remove the stoppers, and weigh. The increase in weight corresponds to the quantity of carbon dioxide evolved. Calculate the quantity, in mg, of magnesium carbonate in each Tablet taken by the formula:

$$(84.31 / 44.01)(I)(W_A / W_P)$$

in which 84.31 and 44.01 are the molecular weights of magnesium carbonate and carbon dioxide, respectively; *I* is the quantity, in mg, of carbon dioxide evolved from the portion of Tablets taken;  $W_A$  is the average weight, in g, of 1

Tablet; and  $W_P$  is the weight, in g, of the portion of Tablets taken.

**Assay for magnesium oxide**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1000 mg of magnesium carbonate and magnesium oxide combined, to a beaker, add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid, with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume, and mix. Transfer 20.0 mL of this solution to a 400-mL beaker, add 180 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 20 mL of water for the assay solution, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 1.216 mg of Mg. Calculate the quantity, in mg, of magnesium equivalent in each Tablet taken by the formula:

$$10T(W_A / W_P)$$

in which *T* is the magnesium equivalent obtained in the titration;  $W_A$  is the average weight, in g, of 1 Tablet; and  $W_P$  is the weight, in g, of the portion of Tablets taken. Calculate the quantity, in mg, of magnesium oxide in each Tablet taken by the formula:

$$(40.30 / 24.31)(A - 0.2883B)$$

in which 40.30 and 24.31 are the molecular weight of magnesium oxide and the atomic weight of magnesium, respectively; *A* is the quantity, in mg, of magnesium equivalent in each Tablet; and *B* is the quantity, in mg, of magnesium carbonate in each Tablet, as determined in the *Assay for magnesium carbonate*.

## Alumina and Magnesium Trisilicate Oral Suspension

» Alumina and Magnesium Trisilicate Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide [ $\text{Al}(\text{OH})_3$ ] and magnesium trisilicate ( $\text{Mg}_2\text{Si}_2\text{O}_7$ ).

**Packaging and storage**—Preserve in tight containers.

#### Identification—

**A:** To a mixture of 5 mL in 10 mL of 3 N hydrochloric acid add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**B:** Wash the solids on the filter obtained in *Identification* test A with hot ammonium chloride solution (1 in 50), add 10 mL of 3 N hydrochloric acid, and filter: the filtrate responds to the tests for *Aluminum* (191).

**C:** Transfer the filter paper and contents from *Identification* test B to a small platinum dish, ignite, cool in a desiccator, and weigh. Moisten the residue with water and add 6 mL of hydrofluoric acid. Evaporate to dryness, ignite for 5 minutes, cool in a desiccator, and weigh: a loss of more

than 10% in relation to the weight of the residue from the initial ignition indicates  $\text{SiO}_2$ .

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

**pH** (791): between 7.5 and 8.5.

**Assay for aluminum hydroxide—**

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Assay preparation*—Transfer about 10 g of well-shaken Oral Suspension to a tared beaker, and weigh accurately. Add 50 mL of water and 10 mL of hydrochloric acid, and digest on a steam bath for 1 hour. Cool, and filter into a 200-mL volumetric flask, washing the filter with water into the flask. Dilute with water to volume, and mix.

*Procedure*—Pipet 20 mL of *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid-ammonium acetate buffer TS, and heat near the boiling point for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

**Assay for magnesium trisilicate—**

*Assay preparation*—Prepare as directed in the Assay for aluminum hydroxide.

*Procedure*—Pipet 20 mL of *Assay preparation* into a 400-mL beaker, add 180 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia-ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 20 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 6.521 mg of  $\text{Mg}_2\text{Si}_3\text{O}_8$ .

## Alumina and Magnesium Trisilicate Tablets

» Alumina and Magnesium Trisilicate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium trisilicate ( $\text{Mg}_2\text{Si}_3\text{O}_8$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Tablets prepared with the use of *Dried Aluminum Hydroxide Gel* may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ . Tablets intended for the temporary relief of heartburn (acid indigestion) due to acid reflux are so labeled. Tablets that must be chewed before swallowing are so labeled.

**Identification**—One powdered Tablet responds to the Identification tests under *Alumina and Magnesium Trisilicate Oral Suspension*.

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test. [NOTE—Tablets that must be chewed before swallowing are exempt from this requirement.]

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium trisilicate.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling. [NOTE—Tablets labeled for the temporary relief of heartburn (acid indigestion) due to acid reflux are exempt from this requirement.]

**Foam** [where Tablets are labeled for the temporary relief of heartburn (acid indigestion) due to acid reflux]—Finely powder a number of Tablets, accurately counted, equivalent to the minimum single dose recommended in the labeling, and transfer the powder to a 100-mL beaker having an inside diameter of 45 mm. Add 5 mL of alcohol and sufficient water to make 40 mL. Mix at 300 rpm for 60 seconds, using a magnetic stirrer and a 9.5- × 38-mm polytetrafluoroethylene-coated stirring bar. Stop the stirrer, and carefully add 10 mL of 0.5 N hydrochloric acid down the side of the beaker. Stir for 30 seconds at 300 rpm. Allow to stand for 10 minutes, and measure the thickness of the foam layer above the liquid in the beaker: the thickness of the foam is not less than 10 mm.

**pH** (791) [where Tablets are labeled for the temporary relief of heartburn (acid indigestion) due to acid reflux]: not less than 4.5, determined on the foam layer obtained in the *Foam* test. [NOTE—Take care that the electrodes do not touch the liquid beneath the foam.]

**Assay for aluminum hydroxide—**

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 600 mg of aluminum hydroxide, to a beaker, add 20 mL of water, stir, and slowly add 40 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and transfer to a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the flask, add water to volume, and mix.

*Procedure*—Pipet 10 mL of *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of 0.05 M *Edetate disodium titrant* and 20 mL of acetic acid-ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

**Assay for magnesium trisilicate—**

*Potassium chloride solution*—Prepare a solution in water containing 5 g of potassium chloride per 100 mL.

*Magnesium standard solution*—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 50 mL of water, and slowly add 10 mL of hydrochloric acid. Dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

*Standard preparations*—Transfer 16.0 mL, 18.0 mL, and 20.0 mL of *Magnesium standard solution* to separate 100-mL volumetric flasks, add 2.0 mL of *Potassium chloride solution* to each flask, dilute with water to volume, and mix. These *Standard preparations* contain 1.6, 1.8, and 2.0 µg of magnesium per mL, respectively. [NOTE—Prepare these solutions on the day of use.]

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of

the powder, equivalent to about 5 mg of magnesium trisilicate, to a 100-mL volumetric flask, and add 10 mL of 18 N sulfuric acid. Heat on a steam bath for 30 minutes with occasional swirling. Allow to cool, dilute with water to volume, and mix. Filter this solution, discarding the first 20 mL of the filtrate. Transfer 20.0 mL of the filtrate to a second 100-mL volumetric flask, add 2.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbance of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with an atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)), equipped with a magnesium hollow-cathode lamp and a nitrous oxide–acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations*, in  $\mu\text{g}$  per mL, of magnesium, and draw the line best fitting the three plotted points. From the graph so obtained determine the concentration,  $C$ , in  $\mu\text{g}$  per mL, of magnesium in the *Assay preparation*. Calculate the quantity, in mg, of magnesium trisilicate ( $\text{Mg}_2\text{Si}_3\text{O}_8$ ) in the portion of Tablets taken by the formula:

$$0.5C(260.86 / 48.62)$$

in which 260.86 is the molecular weight of anhydrous magnesium trisilicate and 48.62 is twice the atomic weight of magnesium.

## Aluminum Acetate Topical Solution

### DEFINITION

Aluminum Acetate Topical Solution yields NLT 1.20 g and NMT 1.45 g of aluminum oxide ( $\text{Al}_2\text{O}_3$ ) and NLT 4.24 g and NMT 5.12 g of acetic acid ( $\text{C}_2\text{H}_4\text{O}_2$ ), corresponding to NLT 4.8 g and NMT 5.8 g of aluminum acetate ( $\text{C}_6\text{H}_9\text{AlO}_6$ ) in each 100 mL. Aluminum Acetate Topical Solution may be stabilized by the addition of NMT 0.6% of boric acid ( $\text{H}_3\text{BO}_3$ ).

Aluminum Subacetate Topical Solution	545 mL
Glacial Acetic Acid	15 mL
Purified Water, a sufficient quantity to make	1000 mL

Add the *Glacial Acetic Acid* to the *Aluminum Subacetate Topical Solution* and sufficient *Purified Water* to bring to final volume. Mix, and filter if necessary. Dispense only clear Aluminum Acetate Topical Solution.

### IDENTIFICATION

- A. IDENTIFICATION TESTS—GENERAL**, *Acetate* (191) and *Aluminum* (191): It meets the requirements of the test for *Aluminum* and for the ferric chloride test for *Acetate*. Ferric chloride TS produces a deep red color that is destroyed by the addition of a mineral acid.

### ASSAY

#### • ALUMINUM OXIDE

**Edetate disodium titrant:** Prepare and standardize 0.05 M edetate disodium titrant as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.

**Sample:** 25 mL

**Blank:** 25 mL of water

**Titrimetric system**

**Mode:** Residual titration

**Back-titrant:** 0.05 M zinc sulfate VS

**Endpoint detection:** Visual

**Analysis:** Pipet the *Sample* into a 250-mL volumetric flask, add 5 mL of hydrochloric acid, and dilute with water to volume. Pipet 25 mL of this solution into a 250-mL beaker, and add, in the order named and with

continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, then heat the solution near the boiling point for 5 min. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the solution with *Back-titrant* to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each mL of *Edetate disodium titrant* is equivalent to 2.549 mg of aluminum oxide ( $\text{Al}_2\text{O}_3$ ).

**Acceptance criteria:** 1.20–1.45 g of aluminum oxide ( $\text{Al}_2\text{O}_3$ ) in 100 mL

#### • ACETIC ACID

**Sample:** 20 mL

**Titrimetric system**

**Mode:** Residual titration

**Titrant:** 0.5 N sodium hydroxide VS

**Back-titrant:** 0.5 N sulfuric acid VS

**Endpoint detection:** Visual

**Analysis:** Pipet the *Sample* into a Kjeldahl flask containing a mixture of 20 mL of phosphoric acid and 150 mL of water. Connect the flask to a condenser, the delivery tube from which dips beneath the surface of 50.0 mL of *Titrant* contained in a receiving flask. Distill about 160 mL, then remove the delivery tube from below the surface of the liquid. Allow the distilling flask to cool, add 50 mL of water, and distill an additional 40–45 mL into the receiving flask. Add phenolphthalein TS to the distillate, and titrate the excess *Titrant* with *Back-titrant*. Each mL of *Titrant* is equivalent to 30.03 mg of acetic acid ( $\text{C}_2\text{H}_4\text{O}_2$ ).

**Acceptance criteria:** 4.24–5.12 g of acetic acid ( $\text{C}_2\text{H}_4\text{O}_2$ ) in 100 mL

### OTHER COMPONENTS

#### • LIMIT OF BORIC ACID

**Sample:** 25 mL

**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.5 N sodium hydroxide VS

**Endpoint detection:** Visual

**Analysis:** Pipet the *Sample* into 75 mL of water in a conical flask. Add 3 mL of phenolphthalein TS, and add *Titrant* from a buret until a faint pink color is obtained. Heat to boiling, and again neutralize. Add 150 mL of glycerin to the neutralized solution, and titrate with *Titrant*. Perform a blank determination in a similar manner. Subtract the volume of *Titrant* used in the blank from the volume of *Titrant* used after the addition of the glycerin. Each mL of *Titrant* is equivalent to 30.92 mg of boric acid ( $\text{H}_3\text{BO}_3$ ).

**Acceptance criteria:** NMT 0.6% of boric acid ( $\text{H}_3\text{BO}_3$ )

### IMPURITIES

**Delete the following:**

#### • HEAVY METALS (231)

**Test preparation:** 2 mL diluted with water to 25 mL

**Acceptance criteria:** NMT 10 ppm • (Official 1-Jan-2018)

### SPECIFIC TESTS

- PH (791):** 3.6–4.4

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Package in tight containers.

## Aluminum Chloride

$\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$  241.43

$\text{AlCl}_3$  133.34

Aluminum chloride, hexahydrate;

Aluminum chloride hexahydrate [7784-13-6].  
Anhydrous [7446-70-0].

### DEFINITION

Aluminum Chloride contains NLT 95.0% and NMT 102.0% of aluminum chloride ( $\text{AlCl}_3$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Aluminum (191) and Chloride (191)**  
Sample solution: 100 mg/mL  
Acceptance criteria: Meets the requirements

### ASSAY

#### • PROCEDURE

**Edate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.

**Sample solution:** 20 mg/mL of aluminum chloride in water

**Titrimetric system**

**Mode:** Back-titration

**Titrant:** 0.05 M zinc sulfate VS

**Endpoint detection:** Visual

**Analysis:** Transfer 10.0 mL of the *Sample solution* into a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and boil gently for 5 min. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the excess edetate disodium with *Titrant* to a bright rose-pink color. Perform a blank determination, substituting 10 mL of water for the *Sample solution*, and make any necessary correction. Each mL of *Edetate disodium titrant* consumed is equivalent to 6.667 mg of aluminum chloride ( $\text{AlCl}_3$ ).  
**Acceptance criteria:** 95.0%–102.0% on the anhydrous basis

### IMPURITIES

#### • LIMIT OF SULFATE

**Sample solution:** 10 mg/mL

**Analysis:** Add 0.2 mL of barium chloride TS to 10 mL of the *Sample solution*.

**Acceptance criteria:** No turbidity is produced within 1 min.

#### • IRON (241)

**Sample:** 1.0 g

**Analysis:** Dissolve the *Sample* in 45 mL of water, and add 2 mL of hydrochloric acid.

**Acceptance criteria:** NMT 10 ppm

### Delete the following:

#### • HEAVY METALS, Method I (231)

**Test preparation:** Dissolve 1 g of sample in 1 mL of 1 N acetic acid, and sufficient water to make 25 mL.

**Acceptance criteria:** NMT 20 ppm (Official 1-Jan-2018)

#### • LIMIT OF ALKALIES AND ALKALINE EARTHS

**Sample:** 1.0 g

**Analysis:** To a boiling solution of the *Sample* in 150 mL of water add a few drops of methyl red TS, then add 6 N ammonium hydroxide until the color of the solution just changes to a distinct yellow. Add hot water to restore the volume to 150 mL, and filter while hot. Evaporate 75 mL of the filtrate to dryness, and ignite to a constant weight.

**Acceptance criteria:** 0.5%; the weight of the residue is NMT 2.5 mg.

### SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** 42.0%–48.0%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

## Aluminum Chlorohydrate

$\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z \cdot \text{H}_2\text{O}$

$\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z \cdot 2\text{H}_2\text{O}$

210.48

$\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z$

174.45

Aluminum chlorohydroxide, dihydrate;  
Aluminum hydroxychloride, dihydrate;  
Aluminum chlorohydroxide;  
Aluminum hydroxychloride;  
Dihydrate [12359-72-7].  
Anhydrous [12042-91-0].

### DEFINITION

Aluminum Chlorohydrate consists of complex basic aluminum chloride that is polymeric and loosely hydrated and encompasses a range of aluminum-to-chloride atomic ratios between 1.91:1 and 2.10:1. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous aluminum chlorohydrate [ $\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z$ ].

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Aluminum (191) and Chloride (191)**  
Sample solution: 100 mg/mL  
Acceptance criteria: Meets the requirements

### ASSAY

#### • PROCEDURE 1: CONTENT OF CHLORIDE

**Sample:** 700 mg

**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.1 N silver nitrate VS

**Electrode system:** A glass silver–silver chloride electrode and a silver billet electrode system

**Endpoint detection:** Potentiometric

**Analysis:** Transfer the *Sample* to a 250-mL beaker and add 100 mL of water and 10 mL of diluted nitric acid with stirring. Titrate with *Titrant* and determine the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Use the chloride content thus obtained to calculate the aluminum:chloride atomic ratio.

#### • PROCEDURE 2: CONTENT OF ALUMINUM

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*, except use 37.2 g of edetate disodium.

**Sample solution:** Transfer 200 mg of Aluminum Chlorohydrate to a 250-mL beaker, add 20 mL of water and 5 mL of hydrochloric acid, boil on a hot plate for NLT 5 min, and allow to cool.

**Titrimetric system**

**Mode:** Back-titration

**Titrant:** 0.1 M zinc sulfate VS

**Endpoint detection:** Visual

**Analysis:** To the *Sample solution* add 25.0 mL of *Edetate disodium titrant*, and adjust with 2.5 N ammonium hydroxide or 1 N acetic acid to a pH of  $4.7 \pm 0.1$ . Add 20 mL of acetic acid–ammonium acetate buffer TS, 50 mL of alcohol, and 5 mL of dithizone TS. The pH of this solution should be  $4.7 \pm 0.1$ . Titrate the excess edetate disodium with *Titrant* until the color changes from green-violet to rose-pink. Perform a blank titration, and make any necessary correction. Each mL of 0.1 M *Ede-*

tate disodium titrant consumed is equivalent to 2.698 mg of aluminum (Al). Use the aluminum content thus obtained to calculate the aluminum:chloride atomic ratio.

• **PROCEDURE 3: ALUMINUM:CHLORIDE ATOMIC RATIO**

**Analysis:** Use the percentage of aluminum found in the test for *Content of Aluminum* and the percentage of chloride found in the test for *Content of Chloride*.

Calculate the aluminum:chloride atomic ratio ( $X$ ) as follows:

$$\text{Result} = (p_{\text{Al}}/p_{\text{Cl}}) \times (A_{\text{Cl}}/A_{\text{Al}})$$

$p_{\text{Al}}$  = percentage of aluminum found in *Content of Aluminum*

$p_{\text{Cl}}$  = percentage of chloride found in *Content of Chloride*

$A_{\text{Cl}}$  = atomic weight of chlorine (Cl), 35.453

$A_{\text{Al}}$  = atomic weight of aluminum (Al), 26.98

**Acceptance criteria:** Between 1.91:1 and 2.10:1

• **PROCEDURE 4**

**Analysis:** Calculate the percentage of anhydrous aluminum chlorohydrate [ $\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z$ ] in the portion of Aluminum Chlorohydrate taken:

$$\text{Result} = P_{\text{Al}}\{[A_{\text{Al}}X + [M(3X - 1)] + A_{\text{Cl}}]/A_{\text{Al}}X\}$$

$P_{\text{Al}}$  = percentage of aluminum as obtained in the test for *Content of Aluminum*

$A_{\text{Al}}$  = atomic weight of aluminum (Al), 26.98

$X$  = aluminum:chloride atomic ratio, as determined in the test for *Aluminum:Chloride Atomic Ratio*

$M$  = molecular weight of the hydroxide anion (OH), 17.01

$A_{\text{Cl}}$  = atomic weight of chlorine (Cl), 35.453

**Acceptance criteria:** 90.0%–110.0% on the anhydrous basis

**IMPURITIES**

- **ARSENIC**, *Method I* (211): NMT 2 ppm

**Delete the following:**

- **HEAVY METALS**, *Method I* (231): NMT 20 ppm (Official 1-Jan-2018)

- **LIMIT OF IRON**

**Standard solution:** Transfer 2.0 mL of *Standard Iron Solution*, prepared as directed in *Iron* (241), to a 50-mL beaker.

**Sample solution:** Transfer 2.7 g of Aluminum Chlorohydrate to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL beaker.

**Analysis:** To each of the beakers containing the *Standard solution* and the *Sample solution*, add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3–5 min. Allow to cool. Add 5 mL of *Ammonium Thiocyanate Solution* (prepared as directed in *Iron* (241)), transfer to separate 50-mL color comparison tubes, and dilute with water to volume.

**Acceptance criteria:** 150 ppm; the color of the solution from the *Sample solution* is not darker than that of the solution from the *Standard solution*.

**SPECIFIC TESTS**

- **PH** (791)

**Sample solution:** 15 g of Aluminum Chlorohydrate in 100 g of water

**Acceptance criteria:** 3.0–5.0

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The label states the content of anhydrous aluminum chlorohydrate.

## Aluminum Chlorohydrate Solution

**DEFINITION**

Aluminum Chlorohydrate Solution consists of complex basic aluminum chloride that is polymeric and encompasses a range of aluminum-to-chloride ratios between 1.91:1 and 2.10:1. The following solvents may be used: water, propylene glycol, dipropylene glycol, or alcohol. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled concentration of anhydrous aluminum chlorohydrate ( $\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z$ ).

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL**, *Aluminum* (191) and *Chloride* (191)

**Sample solution:** Nominally equivalent to 100 mg/mL of anhydrous aluminum chlorohydrate

**Acceptance criteria:** Meets the requirements

- **B. IDENTIFICATION OF PROPYLENE GLYCOL**

Perform this test where propylene glycol is stated on the label.

**Sample solution:** 2 g of Solution in 10 mL of isopropyl alcohol. Mix, filter, and evaporate the filtrate to 1 mL on a steam bath.

**Acceptance criteria:** The IR spectrum of a film of the *Sample solution* on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

- **C. IDENTIFICATION OF DIPROPYLENE GLYCOL**

Perform this test where dipropylene glycol is stated on the label.

**Sample solution:** 2 g of Solution in 10 mL of isopropyl alcohol. Mix, filter, and evaporate the filtrate to 1 mL on a steam bath.

**Acceptance criteria:** The IR spectrum of a film of the *Sample solution* on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

- **D. IDENTIFICATION OF ALCOHOL**

Perform this test where alcohol is stated on the label.

**Analysis:** Mix 5 drops of Solution in a small beaker with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid, and cover the beaker immediately with filter paper moistened with a freshly prepared solution of 0.1 g of sodium nitroferrocyanide and 0.25 g of piperazine in 5 mL of water.

**Acceptance criteria:** An intense blue color is produced on the filter paper, the color becoming paler after a few min.

**ASSAY**

- **PROCEDURE 1: CONTENT OF CHLORIDE**

**Sample:** 1.4 g of Solution

**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.1 N silver nitrate VS

**Electrode system:** A silver–silver chloride glass electrode and a silver billet electrode system

**Endpoint detection:** Potentiometric

**Analysis:** Transfer the *Sample* to a 250-mL beaker, and add 100 mL of water and 10 mL of diluted nitric acid with stirring. Titrate with *Titrant*, and determine the endpoint.

**Acceptance criteria:** Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Use the chloride content thus obtained to calculate the aluminum/chloride atomic ratio.

- **PROCEDURE 2: CONTENT OF ALUMINUM**

**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*, except use 37.2 g of edetate disodium.

**Sample solution:** Transfer 400 mg of Solution to a 250-mL beaker, add 20 mL of water and 5 mL of hydrochloric acid, boil on a hot plate for NLT 5 min, and allow to cool.

#### Titrimetric system

**Mode:** Back titration

**Titrant:** 0.1 M zinc sulfate VS

**Endpoint detection:** Visual

**Analysis:** To the *Sample solution* add 25.0 mL of *Edetate disodium titrant*, and adjust with 2.5 N ammonium hydroxide or 1 N acetic acid to a pH of  $4.7 \pm 0.1$ . Add 20 mL of acetic acid–ammonium acetate buffer TS, 50 mL of alcohol, and 5 mL of dithizone TS. The pH of this solution should be  $4.7 \pm 0.1$ . Titrate excess edetate disodium with *Titrant* until the color changes from green-violet to rose-pink. Perform a blank titration, and make any necessary correction.

**Acceptance criteria:** Each mL of 0.1 M *Edetate disodium titrant* consumed is equivalent to 2.698 mg of aluminum (Al). Use the aluminum content thus obtained to calculate the aluminum/chloride atomic ratio.

#### • PROCEDURE 3: ALUMINUM/CHLORIDE ATOMIC RATIO

**Analysis:** Use the percentage of aluminum found in *Content of Aluminum* and the percentage of chloride found in *Content of Chloride*.

Calculate the aluminum/chloride atomic ratio (X) as follows:

$$\text{Result} = (P_{\text{Al}}/P_{\text{Cl}}) \times (A_{\text{Cl}}/A_{\text{Al}})$$

$P_{\text{Al}}$  = percentage of aluminum found in *Content of Aluminum*

$P_{\text{Cl}}$  = percentage of chloride found in *Content of Chloride*

$A_{\text{Cl}}$  = atomic weight of chlorine (Cl), 35.453

$A_{\text{Al}}$  = atomic weight of aluminum (Al), 26.98

**Acceptance criteria:** 1.91:1 to 2.10:1

#### • PROCEDURE 4

**Analysis:** Calculate the percentage of the labeled concentration of anhydrous aluminum chlorohydrate ( $\text{Al}_x(\text{OH})_{3y-2}\text{Cl}_z$ ) in the portion of Solution taken:

$$\text{Result} = P_{\text{Al}} \times \{[A_{\text{Al}}X + (M(3X - 1)) + A_{\text{Cl}}]/A_{\text{Al}}X\}$$

$P_{\text{Al}}$  = percentage of aluminum found in *Content of Aluminum*

$A_{\text{Al}}$  = atomic weight of aluminum (Al), 26.98

X = aluminum/chloride atomic ratio, as determined in *Aluminum/Chloride Atomic Ratio*

M = molecular weight of the hydroxide anion (OH), 17.01

$A_{\text{Cl}}$  = atomic weight of chlorine (Cl), 35.453

**Acceptance criteria:** 90.0%–110.0%

#### IMPURITIES

• **ARSENIC, Method I (211):** NMT 2 ppm

#### Delete the following:

• **HEAVY METALS, Method I (231):** NMT 10 ppm • (Official 1-Jan-2018)

#### • LIMIT OF IRON

**Standard preparation:** 2.0 mL of *Standard Iron Solution*, prepared as directed in *Iron (241)*

**Test preparation:** Transfer 5.3 g of Solution to a 100-mL volumetric flask, and dilute with water to volume.

**Analysis:** Transfer 2.0 mL of the *Standard preparation* into a 50-mL beaker. Transfer 5.0 mL of the *Test preparation* into a second 50-mL beaker. To each of the beakers add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3–5 min. Allow to cool. Add 5 mL of *Ammonium Thiocyanate Solution*, prepared as directed in *Iron (241)*, transfer to separate

50-mL color-comparison tubes, and dilute with water to volume.

**Acceptance criteria:** 75 ppm; the color of the solution from the *Test preparation* is not darker than that from the *Standard preparation*.

#### SPECIFIC TESTS

##### • PH (791)

**Sample solution:** Dilute 3 g of Solution with water to 10 mL.

**Acceptance criteria:** 3.0–5.0

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **LABELING:** Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum chlorohydrate contained therein.

### Aluminum Chlorohydrate Polyethylene Glycol

Aluminum chlorohydroxide polyethylene glycol complex.

Aluminum hydroxychloride polyethylene glycol complex.

» Aluminum Chlorohydrate Polyethylene Glycol consists of aluminum chlorohydrate in which some of the waters of hydration have been replaced by polyethylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 1.91:1 and 2.10:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum chlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum chlorohydrate.

#### Identification—

A: A solution (1 in 10) responds to the tests for *Aluminum (191)* and for *Chloride (191)*.

B: *Infrared Absorption (197F)*—

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen:** a similar preparation of polyethylene glycol.

**pH (791):** between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I (211):** 2 µg per g.

#### Delete the following:

• **Heavy metals, Method I (231):** 20 µg per g • (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Chlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Chlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum*

under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Chlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.91:1 and 2.10:1.

**Assay**—Calculate the percentage of anhydrous aluminum chlorohydrate in the Aluminum Chlorohydrate Polyethylene Glycol by the formula:

$$Al\{[26.98x + [17.01(3x - 1)] + 35.453] / 26.98x\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Chlorohydrate Propylene Glycol

$Al_2(OH)_{3y-z}Cl_z \cdot nH_2O \cdot mC_3H_8O_2$

$Al_2(H_2O)_{y-z}(OH)_{6-n}(Cl)_n(C_3H_8O_2)_m$

Aluminum chlorohydroxide, hydrate: propylene glycol complex (1:1).

Aluminum hydroxychloride, hydrate: propylene glycol complex (1:1) [53026-85-0].

» Aluminum Chlorohydrate Propylene Glycol is a complex of aluminum chlorohydrate and propylene glycol in which some of the waters of hydration of the aluminum chlorohydrate have been replaced by propylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum chlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum chlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Infrared Absorption* (197F)—

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen**: a similar preparation of propylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231): 20 µg per g. • (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Chlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

### Content of aluminum—

**Edetate disodium titrant**—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*, except to use 37.2 g of edetate disodium instead of 18.6 g.

**Test solution**—Transfer about 1.6 g of Aluminum Chlorohydrate Propylene Glycol, accurately weighed, to a 100-mL beaker, add 15 to 20 mL of water and 5 to 6 mL of hydrochloric acid, and boil on a hot plate for 15 to 20 minutes. Cool the solution, and with the aid of water transfer to a 100-mL volumetric flask. Dilute with water to volume, and mix.

**Procedure**—Transfer 5.0 mL of the *Test solution* to a 250-mL beaker, add 10 to 15 mL of water, and adjust with 1 N sodium hydroxide to a pH of  $1.5 \pm 0.5$ . Add 10.0 mL of *Edetate disodium titrant*, and heat to boiling. Cool the solution and carefully introduce a magnetic stirring bar into the beaker. Add 10 to 15 mL of acetic acid–ammonium acetate buffer TS, 40 to 50 mL of alcohol, and while stirring adjust with glacial acetic acid to a pH of  $4.6 \pm 0.1$ . Add 1 to 2 mL of dithizone TS and 40 to 50 mL of alcohol, and titrate with 0.1 M zinc sulfate VS until the color changes from a green-violet to a rose-pink. Perform a blank titration, and make any necessary correction. Each mL of 0.1 M *Edetate disodium titrant* consumed is equivalent to 2.698 mg of aluminum (Al). Use the aluminum content thus obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Chlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the chloride content thus obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the *Assay* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.91:1 and 2.1:1.

**Assay**—Calculate the percentage of anhydrous aluminum chlorohydrate in the Aluminum Chlorohydrate Propylene Glycol by the formula:

$$Al\{[26.98x + [17.01(3x - 1)] + 35.453] / 26.98x\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide ion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Dichlorohydrate

$Al_2(OH)_{3y-z}Cl_z \cdot nH_2O$

Aluminum chlorohydroxide;

Aluminum hydroxychloride.

### DEFINITION

Aluminum Dichlorohydrate consists of complex basic aluminum chloride that is polymeric and loosely hydrated and encompasses a range of aluminum-to-chloride atomic ra-

tios between 0.90:1 and 1.25:1. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous aluminum dichlorohydrate  $[\text{Al}_2(\text{OH})_3\text{Cl}_2]$ .

## IDENTIFICATION

### • A. IDENTIFICATION TESTS—GENERAL, Aluminum (191) and Chloride (191)

Sample solution: 100 mg/mL

Acceptance criteria: Meets the requirements

## ASSAY

### • PROCEDURE 1: CONTENT OF CHLORIDE

Sample: 700 mg

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Electrode system: A glass silver-silver chloride electrode and a silver billet electrode system

Endpoint detection: Potentiometric

Analysis: Transfer the Sample to a 250-mL beaker, and add 100 mL of water and 10 mL of diluted nitric acid with stirring. Titrate with Titrant, and determine the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Use the chloride content thus obtained to calculate the aluminum:chloride atomic ratio.

### • PROCEDURE 2: CONTENT OF ALUMINUM

EDETATE DISODIUM TITRANT: Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*, except use 37.2 g of edetate disodium.

Sample solution: Transfer 200 mg of Aluminum Dichlorohydrate to a 250-mL beaker, add 20 mL of water and 5 mL of hydrochloric acid, boil on a hot plate for NLT 5 min, and allow to cool.

Titrimetric system

Mode: Back-titration

Titrant: 0.1 M zinc sulfate VS

Endpoint detection: Visual

Analysis: To the Sample solution add 25.0 mL of Edetate disodium titrant, and adjust with 2.5 N ammonium hydroxide or 1 N acetic acid to a pH of  $4.7 \pm 0.1$ . Add 20 mL of acetic acid-ammonium acetate buffer TS, 50 mL of alcohol, and 5 mL of dithizone TS. The pH of this solution should be  $4.7 \pm 0.1$ . Titrate the excess edetate disodium with Titrant until the color changes from green-violet to rose-pink. Perform a blank titration, and make any necessary correction. Each mL of 0.1 M Edetate disodium titrant consumed is equivalent to 2.698 mg of aluminum (Al). Use the aluminum content thus obtained to calculate the aluminum:chloride atomic ratio.

### • PROCEDURE 3: ALUMINUM:CHLORIDE ATOMIC RATIO

Analysis: Use the percentage of aluminum found in the test for *Content of Aluminum* and the percentage of chloride found in the test for *Content of Chloride*. Calculate the aluminum:chloride atomic ratio (X) as follows:

$$\text{Result} = (p_{\text{Al}}/p_{\text{Cl}}) \times (A_{\text{Cl}}/A_{\text{Al}})$$

$p_{\text{Al}}$  = percentage of aluminum found in *Content of Aluminum*

$p_{\text{Cl}}$  = percentage of chloride found in *Content of Chloride*

$A_{\text{Cl}}$  = atomic weight of chlorine (Cl), 35.453

$A_{\text{Al}}$  = atomic weight of aluminum (Al), 26.98

Acceptance criteria: Between 0.90:1 and 1.25:1

### • PROCEDURE 4

Analysis: Calculate the percentage of anhydrous aluminum dichlorohydrate  $[\text{Al}_2(\text{OH})_3\text{Cl}_2]$  in the portion of Aluminum Dichlorohydrate taken:

$$\text{Result} = P_{\text{Al}}\{A_{\text{Al}}X + [M(3X - 1)] + A_{\text{Cl}}\}/A_{\text{Al}}X$$

$P_{\text{Al}}$  = percentage of aluminum as obtained in the test for *Content of Aluminum*

$A_{\text{Al}}$  = atomic weight of aluminum (Al), 26.98

X = aluminum:chloride atomic ratio, as determined in the test for *Aluminum:Chloride Atomic Ratio*

M = molecular weight of the hydroxide anion (OH), 17.01

$A_{\text{Cl}}$  = atomic weight of chlorine (Cl), 35.453

Acceptance criteria: 90.0%–110.0% on the anhydrous basis

## IMPURITIES

### • ARSENIC, Method I (211): NMT 2 ppm

### Delete the following:

### • HEAVY METALS, Method I (231): NMT 20 ppm • (Official 1: Jan-2018)

### • LIMIT OF IRON

Standard solution: Transfer 2.0 mL of *Standard Iron Solution*, prepared as directed in *Iron (241)*, to a 50-mL beaker.

Sample solution: Transfer 2.7 g of Aluminum Dichlorohydrate to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL beaker.

Analysis: To each of the beakers containing the Standard solution and the Sample solution, add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3–5 min. Allow to cool. Add 5 mL of *Ammonium Thiocyanate Solution* (prepared as directed in *Iron (241)*), transfer to separate 50-mL color comparison tubes, and dilute with water to volume.

Acceptance criteria: 150 ppm; the color of the solution from the Sample solution is not darker than that of the solution from the Standard solution.

## SPECIFIC TESTS

### • pH (791)

Sample solution: 15 g of Aluminum Dichlorohydrate in 100 g of water

Acceptance criteria: 3.0–5.0

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in well-closed containers.

### • LABELING: The label states the content of anhydrous aluminum dichlorohydrate.

## Aluminum Dichlorohydrate Solution

### DEFINITION

Aluminum Dichlorohydrate Solution consists of complex basic aluminum chloride that is polymeric and encompasses a range of aluminum-to-chloride atomic ratios between 0.90:1 and 1.25:1. The following solvents may be used: water, propylene glycol, dipropylene glycol, or alcohol. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled concentration of anhydrous aluminum dichlorohydrate  $[\text{Al}_2(\text{OH})_3\text{Cl}_2]$ .

## IDENTIFICATION

### • A. IDENTIFICATION TESTS—GENERAL, Aluminum (191) and Chloride (191)

Sample solution: Nominally equivalent to 100 mg/mL of anhydrous aluminum dichlorohydrate

Acceptance criteria: Meets the requirements

### • B. INFRARED ABSORPTION (197F): (where propylene glycol is indicated on the label)

Sample solution: Add 10 mL of isopropyl alcohol to 2 g of Solution, and filter. Evaporate the filtrate to 1 mL on

a steam bath. Deposit this solution on a silver chloride disk.

**Standard solution:** A similar preparation of propylene glycol

**Acceptance criteria:** Meets the requirements

- **C. INFRARED ABSORPTION** (197F): (where dipropylene glycol is indicated on the label)

**Sample solution:** Add 10 mL of isopropyl alcohol to 2 g of Solution, and filter. Evaporate the filtrate to 1 mL on a steam bath. Deposit this solution on a silver chloride disk.

**Standard solution:** A similar preparation of dipropylene glycol

**Acceptance criteria:** Meets the requirements

- **D. IDENTIFICATION OF ALCOHOL**

Perform this test where alcohol is stated on the label.

**Analysis:** Mix 5 drops of Solution in a small beaker with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid, and cover the beaker immediately with filter paper moistened with a freshly prepared solution of 0.1 g of sodium nitroferricyanide and 0.25 g of piperazine in 5 mL of water.

**Acceptance criteria:** An intense blue color is produced on the filter paper, the color becoming paler after a few min.

## ASSAY

- **PROCEDURE 1: CONTENT OF CHLORIDE**

**Sample:** 1.4 g of Solution

**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.1 N silver nitrate VS

**Electrode system:** A silver-silver chloride glass electrode and a silver billet electrode system

**Endpoint detection:** Potentiometric

**Analysis:** Transfer the *Sample* to a 250-mL beaker, and add 100 mL of water and 10 mL of diluted nitric acid with stirring. Titrate with *Titrant*, and determine the endpoint.

**Acceptance criteria:** Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Use the chloride content thus obtained to calculate the aluminum/chloride atomic ratio.

- **PROCEDURE 2: CONTENT OF ALUMINUM**

**Eдетate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Eдетate Disodium, Twentieth-Molar (0.05 M)*, except use 37.2 g of edetate disodium.

**Sample solution:** Transfer 400 mg of Solution to a 250-mL beaker, add 20 mL of water and 5 mL of hydrochloric acid, boil on a hot plate for NLT 5 min, and allow to cool.

**Titrimetric system**

**Mode:** Back titration

**Titrant:** 0.1 M zinc sulfate VS

**Endpoint detection:** Visual

**Analysis:** To the *Sample solution* add 25.0 mL of *Eдетate disodium titrant*, and adjust with 2.5 N ammonium hydroxide or 1 N acetic acid to a pH of  $4.7 \pm 0.1$ . Add 20 mL of acetic acid-ammonium acetate buffer TS, 50 mL of alcohol, and 5 mL of dithizone TS. The pH of this solution should be  $4.7 \pm 0.1$ . Titrate excess edetate disodium with *Titrant* until the color changes from green-violet to rose-pink. Perform a blank titration, and make any necessary correction.

**Acceptance criteria:** Each mL of 0.1 M *Eдетate disodium titrant* consumed is equivalent to 2.698 mg of aluminum (Al). Use the aluminum content thus obtained to calculate the aluminum/chloride atomic ratio.

- **PROCEDURE 3: ALUMINUM/CHLORIDE ATOMIC RATIO**

**Analysis:** Use the percentage of aluminum found in *Content of Aluminum* and the percentage of chloride found in *Content of Chloride*.

Calculate the aluminum/chloride atomic ratio (X) as follows:

$$\text{Result} = (P_{Al}/P_{Cl}) \times (A_{Cl}/A_{Al})$$

$P_{Al}$  = percentage of aluminum found in *Content of Aluminum*

$P_{Cl}$  = percentage of chloride found in *Content of Chloride*

$A_{Cl}$  = atomic weight of chlorine (Cl), 35.453

$A_{Al}$  = atomic weight of aluminum (Al), 26.98

**Acceptance criteria:** 0.90: 1 to 1.25: 1

- **PROCEDURE 4**

**Analysis:** Calculate the percentage of the labeled concentration of anhydrous aluminum dichlorohydrate ( $Al_2(OH)_3 \cdot 2Cl_2$ ) in the portion of Solution taken:

$$\text{Result} = P_{Al} \times \{[A_{Al}X + (M(3X - 1)) + A_{Cl}]/A_{Al}X\}$$

$P_{Al}$  = percentage of aluminum found in *Content of Aluminum*

$A_{Al}$  = atomic weight of aluminum (Al), 26.98

$X$  = aluminum/chloride atomic ratio, as determined in *Aluminum/Chloride Atomic Ratio*

$M$  = molecular weight of the hydroxide anion (OH), 17.01

$A_{Cl}$  = atomic weight of chlorine (Cl), 35.453

**Acceptance criteria:** 90.0%–110.0%

## IMPURITIES

- **ARSENIC**, *Method I* (211): NMT 2 ppm

## Delete the following:

- **HEAVY METALS**, *Method I* (231): NMT 10 ppm • (Official 1-Jan-2018)

- **LIMIT OF IRON**

**Standard preparation:** 2.0 mL of *Standard Iron Solution*, prepared as directed in *Iron* (241)

**Test preparation:** Transfer 5.3 g of Solution to a 100-mL volumetric flask, and dilute with water to volume.

**Analysis:** Transfer 2.0 mL of the *Standard preparation* into a 50-mL beaker. Transfer 5.0 mL of the *Test preparation* into a second 50-mL beaker. To each of the beakers add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3–5 min. Allow to cool. Add 5 mL of *Ammonium Thiocyanate Solution*, prepared as directed in *Iron* (241), transfer to separate 50-mL color-comparison tubes, and dilute with water to volume.

**Acceptance criteria:** 75 ppm; the color of the solution from the *Test preparation* is not darker than that from the *Standard preparation*.

## SPECIFIC TESTS

- **pH** (791)

**Sample solution:** Dilute 3 g of Solution with water to 10 mL.

**Acceptance criteria:** 3.0–5.0

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum dichlorohydrate contained therein.

## Aluminum Dichlorohydrate Polyethylene Glycol

$\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z \cdot n\text{H}_2\text{O} \cdot m\text{H}(\text{OCH}_2\text{CH}_2)_n\text{OH}$

Aluminum chlorohydroxide polyethylene glycol complex.

Aluminum hydroxychloride polyethylene glycol complex.

» Aluminum Dichlorohydrate Polyethylene Glycol consists of aluminum dichlorohydrate in which some of the waters of hydration have been replaced by polyethylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 0.90:1 and 1.25:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum dichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum dichlorohydrate.

### Identification—

A: A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

B: *Infrared Absorption* (197F)—

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen**: a similar preparation of polyethylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231): 20 µg per g. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Dichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Dichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Dichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively; the ratio is between 0.90:1 and 1.25:1.

**Assay**—Calculate the percentage of anhydrous aluminum dichlorohydrate in the Aluminum Dichlorohydrate Polyethylene Glycol by the formula:

$$\text{Al} / \{ (26.98x + [17.01(3x - 1)] + 35.453) / 26.98x \}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum-to-chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Dichlorohydrate Propylene Glycol

$\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z \cdot n\text{H}_2\text{O} \cdot m\text{C}_3\text{H}_8\text{O}_2$

Aluminum chlorohydroxide propylene glycol complex.

Aluminum hydroxychloride propylene glycol complex.

» Aluminum Dichlorohydrate Propylene Glycol consists of aluminum dichlorohydrate in which some of the waters of hydration have been replaced by propylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 0.90:1 and 1.25:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum dichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum dichlorohydrate.

### Identification—

A: A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

B: Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231): 20 µg per g. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively; the ratio is between 0.90:1 and 1.25:1.

**Assay**—Calculate the percentage of anhydrous aluminum dichlorohydrate in the Aluminum Dichlorohydrate Propylene Glycol by the formula:

$$Al[(26.98x + [17.01(3x - 1)] + 35.453) / 26.98x]$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum-to-chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

### Aluminum Hydroxide Gel

Al(OH)<sub>3</sub> 78.00

Aluminum hydroxide.

Aluminum hydroxide [21645-51-2].

» Aluminum Hydroxide Gel is a suspension of amorphous aluminum hydroxide in which there is a partial substitution of carbonate for hydroxide. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide [Al(OH)<sub>3</sub>]. It may contain Peppermint Oil, Glycerin, Sorbitol, Sucrose, Saccharin, or other suitable flavors, and it may contain suitable antimicrobial agents.

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

#### Identification—

**A:** Place about 1 g in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** The solution remaining in the flask responds to the tests for *Aluminum* (191).

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for the absence of *Escherichia coli*.

**Acid-neutralizing capacity (301)**—Not less than 65.0% of the expected mEq value, calculated from the results of the Assay, is obtained. Each mg of Al(OH)<sub>3</sub> has an expected acid-neutralizing capacity value of 0.0385 mEq.

**pH (791):** between 5.5 and 8.0, determined potentiometrically.

**Chloride**—Transfer an accurately measured quantity of the Gel, equivalent to 0.6 g of Al(OH)<sub>3</sub>, to a porcelain dish. Add 0.1 mL of potassium chromate TS and 25 mL of water. Stir, and add 0.10 N silver nitrate until a faint, persistent pink color is obtained: not more than 8.0 mL of 0.10 N silver nitrate is required [4.7%, based on the Al(OH)<sub>3</sub> content].

**Sulfate (221)**—Add 5.0 mL of 3 N hydrochloric acid to an accurately measured quantity of the Gel, equivalent to 0.3 g of Al(OH)<sub>3</sub>, and heat to dissolve the specimen under test. Cool, dilute with water to 250 mL, and filter if necessary: a 20-mL portion of the filtrate shows no more sulfate than

corresponds to 0.20 mL of 0.020 N sulfuric acid [0.8%, based on the Al(OH)<sub>3</sub> content].

**Arsenic, Method 1 (211)**—Prepare a *Standard Preparation* as directed in the test for *Arsenic* (211), except to prepare it to contain 5 µg of arsenic instead of 3 µg. Prepare the *Test Preparation* as follows. Dissolve an accurately measured quantity of the Gel, equivalent to 0.5 g of Al(OH)<sub>3</sub>, in 20 mL of 7 N sulfuric acid. The limit is 0.001%, based on the Al(OH)<sub>3</sub> content.

#### Delete the following:

• **Heavy metals (231)**—Dissolve an accurately measured quantity of the Gel, equivalent to 0.24 g of Al(OH)<sub>3</sub>, in 10 mL of 3 N hydrochloric acid with the aid of heat, filter, if necessary, and dilute with water to 25 mL: the limit is 0.0083%, based on the Al(OH)<sub>3</sub> content. • (Official 1-Jan-2018)

#### Assay—

**Edetate disodium titrant**—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Procedure**—Transfer an accurately measured quantity of Gel, equivalent to about 1.5 g of Al(OH)<sub>3</sub>, to a beaker, add 15 mL of hydrochloric acid, and heat gently until solution is complete. Cool, transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. Pipet 20 mL of this solution into a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, then heat the solution near the boiling point for 5 minutes. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the solution with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 mL of water for the sample, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of Al(OH)<sub>3</sub>.

### Dried Aluminum Hydroxide Gel

Al(OH)<sub>3</sub> 78.00

Aluminum hydroxide [21645-51-2].

» Dried Aluminum Hydroxide Gel is an amorphous form of aluminum hydroxide in which there is a partial substitution of carbonate for hydroxide. It contains the equivalent of not less than 76.5 percent of Al(OH)<sub>3</sub>, and it may contain varying quantities of basic aluminum carbonate and bicarbonate.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where the quantity of dried aluminum hydroxide gel equivalent is stated in the labeling of any preparation, this shall be understood to be on the basis that each mg of dried gel is equivalent to 0.765 mg of Al(OH)<sub>3</sub>.

#### USP Reference standards (11)—

USP Dried Aluminum Hydroxide Gel RS

#### Identification—

**A: Infrared Absorption (197K).**

**B:** Dissolve 500 mg in 10 mL of 3 N hydrochloric acid, with gentle warming: the solution responds to the tests for *Aluminum* (191).

**Acid-neutralizing capacity (301):** not less than 25.0 mEq per g, 400 mg being tested as directed for *Powders* under *Test Preparation*.

**pH (791):** not higher than 10.0, in an aqueous dispersion (1 in 25).

**Chloride** (221)—Dissolve 1.0 g in 30 mL of 2 N nitric acid, heat to boiling, add water to make 100 mL, and filter: a 5.0-mL portion of the filtrate, diluted with an equal volume of water, shows no more chloride than corresponds to 0.60 mL of 0.020 N hydrochloric acid (0.85%).

**Sulfate** (221)—Dissolve 330 mg in 15 mL of 3 N hydrochloric acid, heat to boiling, add water to make 250 mL, and filter: a 25-mL portion of the filtrate shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.6%).

**Arsenic, Method I** (211)—Dissolve 1.5 g in 80 mL of 7 N sulfuric acid, and dilute with water to 220 mL: 55 mL of the resulting solution meets the requirements of the test, the addition of 20 mL of 7 N sulfuric acid specified under *Procedure* being omitted. The limit is 8 ppm.

#### Delete the following:

• **Heavy metals** (231)—Dissolve 330 mg in 10 mL of 3 N hydrochloric acid with the aid of heat, filter if necessary, and dilute with water to 25 mL: the limit is 0.006%. • (Official 1-Jan-2018)

#### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—Weigh accurately about 2 g of Gel, and dissolve in 15 mL of hydrochloric acid, with the aid of heat. Cool, transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. Pipet 20 mL of this solution into a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, then heat the solution near the boiling point for 5 minutes. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the solution with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, substituting 20 mL of water for the sample solution, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

### Dried Aluminum Hydroxide Gel Capsules

» Dried Aluminum Hydroxide Gel Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The Capsules may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

#### Identification—

A: Place a portion of Capsule contents, equivalent to about 500 mg of aluminum hydroxide, in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 10 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

B: The solution remaining in the flask responds to the tests for *Aluminum* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than 55.0% of the expected mEq value, calculated from the labeled quantity of  $\text{Al}(\text{OH})_3$ , is obtained. Each mg of  $\text{Al}(\text{OH})_3$  has an expected acid-neutralizing capacity value of 0.0385 mEq.

#### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—Weigh accurately the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 1.2 g of aluminum hydroxide, to a beaker, add 15 mL of hydrochloric acid, and heat until dissolved. Dilute with water to about 100 mL, mix, and filter quantitatively into a 500-mL volumetric flask, washing the filter with water. Proceed as directed in the Assay under *Dried Aluminum Hydroxide Gel*, beginning with "dilute with water to volume." Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

### Dried Aluminum Hydroxide Gel Tablets

» Dried Aluminum Hydroxide Gel Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Tablets may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

#### Identification—

A: Place a quantity of finely ground Tablets, equivalent to about 500 mg of aluminum hydroxide, in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

B: The solution remaining in the flask responds to the tests for *Aluminum* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation*.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than 55.0% of the expected mEq value, calculated from the labeled quantity of  $\text{Al}(\text{OH})_3$ , is obtained. Each mg of  $\text{Al}(\text{OH})_3$  has an expected acid-neutralizing capacity value of 0.0385 mEq.

#### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 1.2 g of aluminum hydroxide, add 15 mL of hydrochloric acid, and heat until dissolved. Dilute with water to about 100 mL, mix, and filter quantitatively into a 500-mL volumetric flask, washing the filter with water. Proceed as directed in the Assay under *Dried Aluminum Hydroxide Gel*, beginning with "dilute with water to volume." Each

mL of 0.05 M *Edetate disodium* titrant is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

### Aluminum Phosphate Gel

Phosphoric acid, aluminum salt (1:1).  
Aluminum phosphate (1:1) [7784-30-7].

» Aluminum Phosphate Gel is a water suspension containing not less than 4.0 percent and not more than 5.0 percent (w/w) of aluminum phosphate ( $\text{AlPO}_4$ ). It may contain sodium benzoate, benzoic acid, or other suitable agent, in an amount not exceeding 0.5 percent, as a preservative.

**Packaging and storage**—Preserve in tight containers.

#### Identification—

**A:** A solution of it in hydrochloric acid meets the requirements of the tests for *Aluminum* (191).

**B:** A solution of it in 2 N nitric acid meets the requirements of the tests for *Phosphate* (191).

**pH** (791): between 6.0 and 7.2.

**Soluble phosphate**—Filter 20 g, and wash the residue with 30 mL of water. Add to the filtrate 2 mL of nitric acid, heat to 60°, and add 20 mL of ammonium molybdate TS. Heat at 50° for 30 minutes, filter, wash the precipitate with dilute nitric acid (1 in 36), then wash with potassium nitrate solution (1 in 100) until the last portion of the filtrate is not acid to litmus paper. Dissolve the precipitate in 50.0 mL of 0.5 N sodium hydroxide VS, add phenolphthalein TS, and titrate the excess alkali with 0.5 N hydrochloric acid VS. Each mL of 0.5 N sodium hydroxide is equivalent to 2.065 mg of  $\text{PO}_4$ . The soluble phosphate, calculated as  $\text{PO}_4$ , does not exceed 0.30%.

**Sulfate** (221)—Add 10 mL of 3 N hydrochloric acid to 10 g of Gel, and heat to boiling. Cool, dilute with water to 250 mL, and filter, if necessary. A 10-mL portion of the solution shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid: not more than 0.05% is found.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* by dissolving 5.0 g of Gel in the smallest necessary volume of 3 N hydrochloric acid. The limit is 0.6 ppm.

#### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to make the following modifications.

**Standard Preparation**—Into a 50-mL color-comparison tube pipet 4.0 mL of *Standard Lead Solution*, dilute with water to 25 mL, adjust with 6 N ammonium hydroxide to a pH between 1.9 and 2.1, dilute with water to 40 mL, and mix.

**Test Preparation**—Dissolve 8.0 g in 5 mL of 3 N hydrochloric acid, warming if necessary, dilute with water to 25 mL, and adjust with 6 N ammonium hydroxide to a pH between 1.9 and 2.1. Transfer to a 50-mL color-comparison tube, dilute with water to 40 mL, and mix.

**Monitor Preparation**—Into a 50-mL color-comparison tube place 25 mL of the *Test Preparation*, add 4.0 mL of *Standard Lead Solution*, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 1.9 and 2.1, dilute with water to 40 mL, and mix.

**Procedure**—Proceed as directed in the chapter, except to omit the addition of 2 mL of pH 3.5 *Acetate Buffer*. Not more than 5 µg per g is found. (Official 1-Jan-2018)

**Chloride**—Transfer 25 g to a beaker with the aid of about 50 mL of water, add 5 mL of nitric acid, mix, then add, with stirring, 30.0 mL of 0.1 N silver nitrate VS. Warm on a steam bath for 30 minutes, filter, and wash the precipitate with water acidified with nitric acid. To the filtrate add ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Not more than 0.16% of chloride is found.

**Assay**—To about 20 g of Gel, accurately weighed, in a 100-mL volumetric flask, add nitric acid to effect solution, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 400-mL beaker, dilute with water to 100 mL, heat to 60°, add an excess of ammonium molybdate TS, and maintain at 50° for 30 minutes. Filter, and wash the precipitate with dilute nitric acid (1 in 36), then with potassium nitrate solution (1 in 100) until the last portion of the filtrate is not acid to litmus paper. Dissolve the precipitate in 50.0 mL of 0.5 N sodium hydroxide VS, add phenolphthalein TS, and titrate the excess sodium hydroxide with 0.5 N sulfuric acid VS. Each mL of 0.5 N sodium hydroxide is equivalent to 2.651 mg of  $\text{AlPO}_4$ .

### Aluminum Sesquichlorohydrate

$\text{Al}_2(\text{OH})_3\text{Cl}_2 \cdot n\text{H}_2\text{O}$

Aluminum chlorohydroxide.

Aluminum hydroxychloride [11097-68-0].

» Aluminum Sesquichlorohydrate consists of complex basic aluminum chloride that is polymeric and loosely hydrated and encompasses a range of aluminum-to-chloride atomic ratios between 1.26:1 and 1.90:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum sesquichlorohydrate.

**Identification**—A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

#### Delete the following:

• **Heavy metals, Method I** (231): 20 µg per g. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Sesquichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum*

by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Aluminum Sesquichlorohydrate by the formula:

$$Al\{[26.98x + [17.01(3x - 1)] + 35.453] / 26.98x\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

### Aluminum Sesquichlorohydrate Solution

» Aluminum Sesquichlorohydrate Solution consists of complex basic aluminum chloride that is polymeric and encompasses a range of aluminum-to-chloride atomic ratios between 1.26:1 and 1.90:1. The following solvents may be used: water, propylene glycol, dipropylene glycol, or alcohol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum sesquichlorohydrate contained therein.

#### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum sesquichlorohydrate per mL responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of alcohol* (where stated on the label)—Mix 5 drops of Solution in a small beaker with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid, and cover the beaker immediately with filter paper moistened with a freshly prepared solution of 0.1 g of sodium nitroferricyanide and 0.25 g of piperazine in 5 mL of water: an intense blue color is produced on the filter paper, the color becoming paler after a few minutes.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

#### Delete the following:

• **Heavy metals, Method I** (231)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 10 µg per g. • (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Sesquichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Limit of iron* under *Aluminum Chlorohydrate Solution*. The limit is 75 µg per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Content of aluminum* under *Aluminum Chlorohydrate Solution*. Use the result to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Content of chloride* under *Aluminum Chlorohydrate Solution*. Use the result to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Solution by the formula:

$$Al\{[26.98x + [17.01(3x - 1)] + 35.453] / 26.98x\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

### Aluminum Sesquichlorohydrate Polyethylene Glycol

$Al_y(OH)_{3y-z}Cl_z \cdot nH_2O \cdot mH(OCH_2CH_2)_nOH$   
Aluminum chlorohydroxide polyethylene glycol complex.  
Aluminum hydroxychloride polyethylene glycol complex.

» Aluminum Sesquichlorohydrate Polyethylene Glycol consists of aluminum sesquichlorohydrate in which some of the waters of hydration have been replaced by polyethylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 1.26:1 and 1.90:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum sesquichlorohydrate.

#### Identification—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B: Infrared Absorption (197F)—**

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen**: a similar preparation of polyethylene glycol.

**pH (791)**: between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I (211)**: 2 µg per g.

**Delete the following:**

• **Heavy metals, Method I (231)**: 20 µg per g. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Sesquichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively; the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Aluminum Sesquichlorohydrate Polyethylene Glycol by the formula:

$$Al[(26.98x + [17.01(3x - 1)]) + 35.453] / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Sesquichlorohydrate Propylene Glycol

$Al_2(OH)_3 \cdot 2Cl_2 \cdot nH_2O \cdot mC_3H_8O_2$

Aluminum chlorohydroxide propylene glycol complex.  
Aluminum hydroxychloride propylene glycol complex.

» Aluminum Sesquichlorohydrate Propylene Glycol consists of aluminum sesquichlorohydrate in which some of the waters of hydration have been replaced by propylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 1.26:1 and 1.90:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum sesquichlorohydrate.

**Identification—**

**A**: A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B: Infrared Absorption (197F)—**

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen**: a similar preparation of propylene glycol.

**pH (791)**: between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I (211)**: 2 µg per g.

**Delete the following:**

• **Heavy metals, Method I (231)**: 20 µg per g. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Sesquichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively; the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Aluminum Sesquichlorohydrate Propylene Glycol by the formula:

$$Al[(26.98x + [17.01(3x - 1)]) + 35.453] / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Subacetate Topical Solution

» Aluminum Subacetate Topical Solution yields, from each 100 mL, not less than 2.30 g and not more than 2.60 g of aluminum oxide ( $Al_2O_3$ ), and not less than 5.43 g and not more than 6.13 g of acetic acid ( $C_2H_4O_2$ ). It may be stabilized by the addition of not more than 0.9 percent of boric acid.

Aluminum Subacetate Topical Solution may be prepared as follows.

Aluminum Sulfate . . . . .	145 g
Acetic Acid . . . . .	160 mL
Calcium Carbonate . . . . .	70 g
Purified Water, a sufficient quantity, to make . . . . .	1000 mL

Dissolve the Aluminum Sulfate in 600 mL of cold water, filter the solution, and add the Calcium Carbonate gradually, in several portions, with constant stirring. Then slowly add the Acetic Acid, mix, and set the mixture aside for 24 hours. Filter the product with the aid of vacuum if necessary, returning the first portion of the filtrate to the funnel. Wash the magma on the filter with small portions of cold water, until the total filtrate measures 1000 mL.

**Packaging and storage**—Preserve in tight containers.

**Identification**—It responds to the tests for *Aluminum* (191) and for the ferric chloride test for *Acetate* (191) with a deep red color upon the addition of ferric chloride TS. This color is destroyed by the addition of a mineral acid.

**pH** (791): between 3.8 and 4.6.

**Limit of boric acid**—Proceed as directed in the test for *Limit of boric acid* under *Aluminum Acetate Topical Solution*.

**Assay for aluminum oxide**—

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

*Procedure*—Pipet 20 mL of Topical Solution into a 250-mL volumetric flask, add 5 mL of hydrochloric acid, dilute with water to volume, and mix. Pipet 25 mL of this dilution into a 250-mL beaker, and proceed as directed for *Procedure* in the *Assay for aluminum oxide* under *Aluminum Acetate Topical Solution*, beginning with "add, in the order named." Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 2.549 mg of  $\text{Al}_2\text{O}_3$ .

**Assay for acetic acid**—Proceed as directed in the *Assay for acetic acid* under *Aluminum Acetate Topical Solution*.

## Aluminum Sulfate

$\text{Al}_2(\text{SO}_4)_3 \cdot x\text{H}_2\text{O}$  (anhydrous) 342.15  
Sulfuric acid, aluminum salt (3:2), hydrate.  
Aluminum sulfate (2:3) hydrate [17927-65-0].  
Anhydrous 342.16 [10043-01-3].

» Aluminum Sulfate contains not less than 54.0 percent and not more than 59.0 percent of  $\text{Al}_2(\text{SO}_4)_3$ . It contains a varying amount of water of crystallization.

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—A solution (1 in 10) responds to the tests for *Aluminum* and for *Sulfate* (191).

**pH** (791): not less than 2.9, in a solution (1 in 20).

**Water Determination, Method I** (921): not less than 41.0% and not more than 46.0%.

**Delete the following:**

• **Heavy metals** (231)—Dissolve 1.0 g in 2 mL of 1 N acetic acid, and dilute with water to 25 mL. The limit is 20 µg per g. (Official 1-Jan-2018)

**Limit of alkalies and alkaline earths**—To a boiling solution of 1.0 g in 150 mL of water add a few drops of methyl red TS and then add 6 N ammonium hydroxide just until the color of the solution changes to a distinct yellow. Add hot water to restore the volume to 150 mL, and filter while hot. Evaporate 75 mL of the filtrate to dryness, and ignite to constant weight: not more than 2 mg of residue remains (0.4%).

**Limit of ammonium salts**—Heat 1 g with 10 mL of 1 N sodium hydroxide on a steam bath for 1 minute: the odor of ammonia is not perceptible.

**Iron**—To 20 mL of a solution (1 in 150) add 0.3 mL of potassium ferrocyanide TS: no blue color is produced immediately.

**Assay**—

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

*Procedure*—Transfer about 7.5 g of Aluminum Sulfate, accurately weighed, to a 250-mL volumetric flask, and dissolve in water. Dilute with water to volume, mix, and pipet 10 mL of the solution into a 250-mL beaker. Proceed as directed in the *Assay for aluminum oxide* under *Aluminum Acetate Topical Solution*, beginning with "add, in the order named." Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 8.554 mg of  $\text{Al}_2(\text{SO}_4)_3$ .

## Aluminum Sulfate and Calcium Acetate for Topical Solution

### DEFINITION

Aluminum Sulfate and Calcium Acetate for Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum sulfate tetradecahydrate [ $\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}$ ] and calcium acetate monohydrate ( $\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O}$ ).

### IDENTIFICATION

#### • A.

**Sample:** 0.25 g of Aluminum Sulfate and Calcium Acetate for Topical Solution

**Analysis:** Place the *Sample* in a test tube. Add 10 mL of water and 0.25 g of calcium carbonate. Heat on a steam bath for 10 min, and filter. Add 3–4 drops of ferric chloride TS to the filtrate. [NOTE—After the addition of the ferric chloride TS, the solution may be heated for 1 min to speed the reaction.]

**Acceptance criteria:** A reddish-brown color or precipitate indicates acetate.

#### • B. IDENTIFICATION TESTS—GENERAL, Sulfate (191) and Calcium (191)

**Sample solution:** Suspend 2 g of sample in 50 mL of water and filter.

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • ALUMINUM SULFATE TETRADECAHYDRATE

**Sample solution:** Transfer 10 g of Aluminum Sulfate and Calcium Acetate for Topical Solution to a 1000-mL volumetric flask. Add 100 mL of 1.2 N hydrochloric acid and 250 mL of water. Heat on a steam bath or hot plate until dissolved. Cool, and dilute with water to volume. Retain a portion of the *Sample solution* for the *Assay for Calcium Acetate Monohydrate*.

Blank: Water

Titrimetric system

Mode: Residual titration

Titrant: 0.02 M zinc sulfate VS

Endpoint detection: Visual

**Analysis:** Transfer a 5.0-mL aliquot of the *Sample solution* to a 250-mL conical flask. Add, in the order named, 40.0 mL of 0.01 M edetate disodium VS and 20 mL of acetic acid–ammonium acetate buffer TS, and mix by swirling. Add 50 mL of alcohol and 2 mL of dithizone TS, and titrate the excess 0.01 M edetate disodium VS with *Titrant* until the color changes from green-violet to a clear rose-pink. Perform a blank titration, substituting 5.0 mL of water for the *Sample solution*.

Calculate the percentage of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$  in the portion of Aluminum Sulfate and Calcium Acetate for Topical Solution taken:

$$\text{Result} = \{[D \times (V_B - V_S) \times M \times F] / W\} \times 100$$

$D$  = dilution factor, 1000/5.0

$V_B$  = blank titration volume (mL)

$V_S$  = sample titration volume (mL)

$M$  = molarity of the *Titrant* (mmol/mL)

$F$  = equivalency factor, 297.2 (mg/mmol)

$W$  = weight of sample used (mg)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$

#### • CALCIUM ACETATE MONOHYDRATE

**Sample:** Transfer a 5.0-mL aliquot of the *Sample solution* retained from the Assay for Aluminum Sulfate Tetradecahydrate to a 250-mL conical flask.

Titrimetric system

Mode: Direct titration

Titrant: 0.01 M edetate disodium VS

Endpoint detection: Visual

**Analysis:** Add 1–2 mL of 50% triethanolamine to mask the aluminum, and mix well. With constant stirring, add to the *Sample*, in the order named, 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue, and titrate with *Titrant*. The indicator will change from purple to a clear blue color at the endpoint.

Calculate the percentage of calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$  in the portion of Aluminum Sulfate and Calcium Acetate for Topical Solution taken:

$$\text{Result} = [(D \times V \times M \times F) / W] \times 100$$

$D$  = dilution factor, 1000/5.0

$V$  = sample titration volume (mL)

$M$  = molarity of the *Titrant* (mmol/mL)

$F$  = equivalency factor, 176.2 (mg/mmol)

$W$  = weight of sample used (mg)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$

#### SPECIFIC TESTS

##### • pH (791)

**Sample solution:** 1 g of Aluminum Sulfate and Calcium Acetate for Topical Solution in 200 mL of water

**Acceptance criteria:** 4.0–4.8

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-unit containers, and protect from excessive heat.

## Aluminum Sulfate and Calcium Acetate Tablets for Topical Solution

### DEFINITION

Aluminum Sulfate and Calcium Acetate Tablets for Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$  and calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$ .

### IDENTIFICATION

#### • A. IDENTIFICATION TESTS—GENERAL, Aluminum (191)

**Sample solution:** Suspend 2 g of ground Tablet powder in 50 mL of water, and filter. Use a portion in the *Analysis*, and retain the remaining filtrate for *Identification* test B.

**Analysis:** Mix 2 mL of the *Sample solution* with 2 mL of water and 2 drops of 3 N hydrochloric acid.

**Acceptance criteria:** Meets the requirements of the ammonium hydroxide test

#### • B. IDENTIFICATION TESTS—GENERAL, Sulfate (191) and Calcium (191)

**Sample solution:** A portion of the filtrate retained from *Identification* test A

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • ALUMINUM SULFATE TETRADECAHYDRATE

**Sample solution:** Finely powder and mix NLT 20 Tablets. Weigh a portion of the powder, equivalent to 2.8 g of aluminum sulfate, and transfer to a 1000-mL volumetric flask. Add 100 mL of 1.2 N hydrochloric acid and 100 mL of water, and heat on a steam bath, with occasional swirling, to dissolve the powder. Allow the solution to cool, and dilute with water to volume. Retain a portion of the *Sample solution* for the Assay for Calcium Acetate Monohydrate.

Blank: Water

Titrimetric system

Mode: Residual titration

Titrant: 0.02 M zinc sulfate VS

Back-titrant: 0.01 M edetate disodium VS

Endpoint detection: Visual

**Analysis:** Transfer 25.0 mL of the *Sample solution* to a 250-mL conical flask. Add, in the order named, 40.0 mL of *Back-titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and mix by swirling. Add 50 mL of alcohol and 2 mL of dithizone TS, and titrate the excess *Back-titrant* with *Titrant* until the color changes from green-violet to a clear rose-pink. Perform a blank determination. Each mL of 0.01 M edetate disodium is equivalent to 2.972 mg of the labeled amount of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$ .

**Acceptance criteria:** 90.0%–110.0%

#### • CALCIUM ACETATE MONOHYDRATE

**Sample:** Transfer 20.0 mL of the *Sample solution* retained from the Assay for Aluminum Sulfate Tetradecahydrate to a 125-mL conical flask.

Titrimetric system

Mode: Direct titration

Titrant: 0.01 M edetate disodium VS

Endpoint detection: Visual

**Analysis:** With constant stirring, add to the *Sample*, in the order named, 0.5 mL of triethylamine, 10 mL of ammonia–ammonium chloride buffer TS, and 3 drops of a solution prepared by dissolving 500 mg of eriochrome black T titration in 10 mL of methanol. Titrate with *Titrant* to a violet endpoint. Each mL of 0.01 M edetate disodium is equivalent to 1.762 mg of the labeled amount of calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$ .

Acceptance criteria: 90.0%–110.0%

#### PERFORMANCE TESTS

- **DISINTEGRATION** (701): 10 min
- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements for *Weight Variation*

#### SPECIFIC TESTS

- **pH** (791)  
Sample solution: 2 g of ground Tablet powder in 500 mL of water  
Acceptance criteria: 4.0–4.8
- **LOSS ON DRYING** (731)  
Analysis: Dry ground Tablet powder at 150° for 15 min.  
Acceptance criteria: NMT 18%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid excessive heat.

### Aluminum Zirconium Octachlorohydrate

$\text{Al}_y\text{Zr}(\text{OH})_{3y+4-x}\text{Cl}_x \cdot n\text{H}_2\text{O}$

» Aluminum Zirconium Octachlorohydrate is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum zirconium octachlorohydrate.

**Identification**—A solution (1 in 10) responds to the test for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic**, *Method I* (211): 2 µg per g.

#### Delete the following:

• **Heavy metals**, *Method I* (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 *Acetate Buffer*, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of

each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found. (Official 1-Jan-2018)

#### Limit of iron—

**Standard preparation**—Transfer 2.0 mL of *Standard Iron Solution*, prepared as directed under *Iron* (241), to a 50-mL beaker.

**Test preparation**—Transfer 2.7 g of Aluminum Zirconium Octachlorohydrate to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL beaker.

**Procedure**—To each of the beakers containing the *Standard preparation* and the *Test preparation* add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3 to 5 minutes. Allow to cool, add 5 mL of *Ammonium Thiocyanate Solution*, prepared as directed under *Iron* (241), transfer to separate 50-mL color comparison tubes, dilute with water to volume, and mix: the color of the solution from the *Test preparation* is not darker than that of the solution from the *Standard preparation* (150 µg per g).

**Content of aluminum**—Transfer about 0.15 g of Aluminum Zirconium Octachlorohydrate, accurately weighed, to a 150-mL beaker, and add 5 mL of water and 15 mL of hydrochloric acid. Heat this solution to boiling, and continue boiling for 5 minutes. Add 40 mL of water and 15.0 mL of 0.1 M edetate disodium VS. Heat the solution to boiling, and continue boiling for 5 minutes. Allow the solution to cool, add 10 to 15 mL of acetic acid–ammonium acetate buffer TS, and adjust with ammonium hydroxide to a pH of  $4.5 \pm 0.1$ . Add 20 mL of alcohol, and adjust with ammonium hydroxide to a pH of  $4.6 \pm 0.1$ . Add 5 to 10 drops of dithizone TS, and titrate with 0.1 M zinc sulfate VS until the first permanent purple-pink color appears. Perform a blank determination, and make any necessary correction. Calculate the percentage of aluminum (Al) in the Aluminum Zirconium Octachlorohydrate by the formula:

$$2.698[15.0 M_e - (zM_z + Z_e)] / W$$

in which  $M_e$  is the molarity of the edetate disodium VS;  $z$  is the volume, in mL, of zinc sulfate VS consumed;  $M_z$  is the molarity of the zinc sulfate VS;  $W$  is the quantity, in g, of Aluminum Zirconium Octachlorohydrate taken;  $Z_e$  is the equivalent volume, in mL, of edetate disodium VS consumed by the zirconium moiety, calculated as follows:

$$(\text{Zr}/M_e)(W/92.97)$$

in which  $Zr$  is the percentage of zirconium as determined in the test for *Content of zirconium*, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and the other terms are as defined above. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Transfer about 250 mg of Aluminum Zirconium Octachlorohydrate, accurately weighed, to a 150-mL beaker, and add 5 mL of water and 15 mL of hydrochloric acid. Heat this solution to boiling, and continue boiling for 6 to 8 minutes. Add 30 to 40 mL of water and 5 mL of hydrochloric acid, and heat to boiling. Add 1 drop of xylol orange TS, and, while still hot, titrate with 0.1 M edetate disodium VS until the color of the solution changes from pink to yellow. Perform a blank determination, and

make any necessary correction. Each mL of 0.1 M edetate disodium is equivalent to 9.297 mg of zirconium (Zr). Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Transfer about 250 mg of Aluminum Zirconium Octachlorohydrate, accurately weighed, to a 250-mL beaker, add 100 to 120 mL of water and 20 mL of diluted nitric acid, and swirl to dissolve. Titrate with 0.05 N silver nitrate VS using a calomel electrode and a silver billet electrode system, determining the endpoint potentiometrically. Each mL of 0.05 N silver nitrate is equivalent to 1.773 mg of chloride (Cl). Use the result obtained to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)] / (Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Aluminum Zirconium Octachlorohydrate by the formula:

$$Al\{(26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1) / z\} / 26.98y\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Octachlorohydrate Solution

» Aluminum Zirconium Octachlorohydrate Solution consists of complex basic aluminum chloride that is polymeric and encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium octachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium octachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211): Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Octachlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Limit of iron* under *Aluminum Chlorohydrate Solution*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Octachlorohydrate Solution, accurately weighed,

instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the *(aluminum plus zirconium)/chloride atomic ratio* by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Solution by the formula:

$$Al[(26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z]) + 35.453(y + 1)/z]/26.98y]$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the *(aluminum plus zirconium)/chloride atomic ratio* found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Octachlorohydrate Gly

» Aluminum Zirconium Octachlorohydrate Gly is a derivative of Aluminum Zirconium Octachlorohydrate in which some of the water molecules have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than 90.0 percent and not more than 110.0 per-

cent of the labeled amount of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium octachlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the test for *Chloride* (191).

**B:** Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium*

atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Aluminum Zirconium Octachlorohydrate Gly by the formula:

$$Al/[26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z]/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Octachlorohydrate Gly Solution

» Aluminum Zirconium Octachlorohydrate Gly Solution is a solution of Aluminum Zirconium Octachlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium octachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium octachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of glycine*—Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Octachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as di-

rected in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Octachlorohydrate Gly Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Solution by the formula:

$$AK\{[26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z]] / 35.453(y + 1)/z\} / 26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate

$Al_yZr_x(OH)_{3y+4-x}Cl_x \cdot nH_2O$

» Aluminum Zirconium Pentachlorohydrate is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios

between 2.1:1 and 1.51:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum zirconium pentachlorohydrate.

**Identification**—A solution (1 in 10) responds to the test for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found. • (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is

the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride, as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Aluminum Zirconium Pentachlorohydrate by the formula:

$$Al\{[26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z]] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for (Aluminum plus zirconium)/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate Solution

» Aluminum Zirconium Pentachlorohydrate Solution is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium pentachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium pentachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solu-

tion, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

### Delete the following:

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Pentachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Pentachlorohydrate Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Pentachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use

the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum; the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Pentachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the *(aluminum plus zirconium)/chloride atomic ratio* by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine; the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Solution by the formula:

$$Al/[(26.98y + 92.97 + (17.01)(3y + 4 - (y + 1)/z) + 35.453(y + 1)/z]/26.98y\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the *(aluminum plus zirconium)/chloride atomic ratio* found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate Gly

» Aluminum Zirconium Pentachlorohydrate Gly is a derivative of Aluminum Zirconium Pentachlorohydrate in which some of the water molecules have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1 and a range of *(aluminum plus zirconium)-to-chloride* atomic ratios between 2.1:1 and 1.51:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium pentachlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the test for *Chloride* (191).

**B:** Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found. • (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content*

of zirconium, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Aluminum Zirconium Pentachlorohydrate Gly by the formula:

$$Al\{[26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z]] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for (Aluminum plus zirconium)/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate Gly Solution

» Aluminum Zirconium Pentachlorohydrate Gly Solution is a solution of Aluminum Zirconium Pentachlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium ratios between 6.0:1 and 10.0:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium pentachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium pentachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of glycine*—Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the *(aluminum plus zirconium)/chloride atomic ratio* by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Solution by the formula:

$$Al/[26.98y + 92.97 + (17.01)(3y + 4 - (y + 1)/z) + 35.453(y + 1)/z]/26.98y]$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the *(aluminum plus zirconium)/chloride atomic ratio* found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate

$Al_yZr(OH)_{3y+4-x}Cl_x \cdot nH_2O$

» Aluminum Zirconium Tetrachlorohydrate is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than

90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum zirconium tetrachlorohydrate.

**Identification**—A solution (1 in 10) responds to the test for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium

content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium tetrachlorohydrate in the Aluminum Zirconium Tetrachlorohydrate by the formula:

$$Al\{[26.98y + 92.97 + 17.01\{3y + 4 - (y + 1)/z\} + 35.453(y + 1)/z]/26.98y\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate Solution

» Aluminum Zirconium Tetrachlorohydrate Solution is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium tetrachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium tetrachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a

silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

*Test Preparation*—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

*Monitor Preparation*—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

*Procedure*—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found. • (Official 1-Jan-2018)

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Tetrachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Tetrachlorohydrate Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Tetrachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium* and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Tetrachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium tetrachlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z]\} + 35.453(y + 1)/z/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for (Aluminum plus zirconium)/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate Gly

» Aluminum Zirconium Tetrachlorohydrate Gly is a derivative of Aluminum Zirconium Tetrachlorohydrate in which some of the water molecules have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium tetrachlorohydrate.

### Identification—

A: A solution (1 in 10) responds to the test for *Chloride* (191).

B: Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Content of zirconium**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of*

chloride under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio—**Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay—**Calculate the percentage of anhydrous aluminum zirconium tetrachlorohydrate in the Aluminum Zirconium Tetrachlorohydrate Gly by the formula:

$$Al\{[26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z]/26.98y\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for (Aluminum plus zirconium)/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate Gly Solution

» Aluminum Zirconium Tetrachlorohydrate Gly Solution is a solution of Aluminum Zirconium Tetrachlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage—**Preserve in well-closed containers.

**Labeling—**Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium tetrachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium tetrachlorohydrate per mL responds to the test for *Chloride* (191).

**B: Identification of propylene glycol** (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wave-

lengths as that of a similar preparation of a film of propylene glycol.

**C: Identification of dipropylene glycol** (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D: Identification of glycine—**Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation—**Prepare as directed in the chapter, using an accurately weighed quantity of Solution. Not more than 20 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under Aluminum Zirconium Octachlorohydrate. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under Aluminum Zirconium Octachlorohydrate. Use the result obtained to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Content of zirconium**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under Aluminum Zirconium Octachlorohydrate. Use the result obtained to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under Aluminum Zirconium Octachlorohydrate. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio—**Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay—**Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Aluminum Zirconium Trichlorohydrate by the formula:

$$Al[(26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z]) / 35.453(y + 1)/z] / 26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

### Aluminum Zirconium Trichlorohydrate Solution

» Aluminum Zirconium Trichlorohydrate Solution is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium trichlorohydrate.

**Packaging and storage—**Preserve in well-closed containers.

**Labeling—**Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium trichlorohydrate.

#### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium trichlorohydrate per mL responds to the test for *Chloride* (191).

**B: Identification of propylene glycol** (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C: Identification of dipropylene glycol** (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wave-

lengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

#### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation—**Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation—**Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure—**To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found. • (Official 1-Jan-2018)

**Limit of iron—**Using about 5.4 g of Aluminum Zirconium Trichlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum—**Using about 0.3 g of Aluminum Zirconium Trichlorohydrate Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium—**Using about 500 mg of Aluminum Zirconium Trichlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio—**Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium* and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride—**Using about 500 mg of Aluminum Zirconium Trichlorohydrate Solution, accurately weighed, in-

stead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio as determined in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride ratio determined in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Trichlorohydrate Gly

» Aluminum Zirconium Trichlorohydrate Gly is a derivative of Aluminum Zirconium Trichlorohydrate in which some of the water molecules have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium trichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium trichlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the test for *Chloride* (191).

**B:** Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found. (Official 1-Jan-2018)

**Limit of iron**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio—** Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay—**Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Aluminum Zirconium Trichlorohydrate Gly by the formula:

$$Al\{[26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z]/26.98y\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Trichlorohydrate Gly Solution

» Aluminum Zirconium Trichlorohydrate Gly Solution is a solution of Aluminum Zirconium Trichlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium trichlorohydrate.

**Packaging and storage—**Preserve in well-closed containers.

**Labeling—**Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium trichlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium trichlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solu-

tion, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of glycine*—Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

### Delete the following:

• **Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

*Test Preparation*—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

Use the result to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio, as determined in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio as determined in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Amantadine Hydrochloride

$C_{10}H_{17}N \cdot HCl$  187.71  
Tricyclo[3.3.1.1<sup>3,7</sup>]decan-1-amine, hydrochloride;  
1-Adamantanamine hydrochloride [665-66-7].

### DEFINITION

Amantadine Hydrochloride contains NLT 98.5% and NMT 101.5% of  $C_{10}H_{17}N \cdot HCl$ .

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197S)

Cell: 1 mm

**Sample solution:** 50 mg in 10 mL of 0.1 N hydrochloric acid, and filter. Transfer the filtrate to a suitable separator, add 1 mL of 5 N sodium hydroxide, and extract with 5 mL of methylene chloride.

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Sample:** Dissolve 120 mg of Amantadine Hydrochloride in a mixture of 30 mL of glacial acetic acid and 10 mL of mercuric acetate TS.

**Analysis:** Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using suitable electrodes. Perform a blank determination. Each mL of 0.1 N perchloric acid is equivalent to 18.77 mg of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ).

**Acceptance criteria:** 98.5%–101.5%

### IMPURITIES

**Delete the following:**

#### • HEAVY METALS, Method I (231)

**Test preparation:** Use 1 mL of 1 N acetic acid.

**Acceptance criteria:** NMT 10 ppm (Official: 1-Jan-2018)

#### • ORGANIC IMPURITIES

**Internal standard solution:** 50 mg/mL of adamantane in dichloromethane

**Standard solution:** Transfer 10 mg of USP Amantadine Hydrochloride RS to a separator. Add 20 mL of 5.0 N sodium hydroxide and 18 mL of dichloromethane, and shake for 10 min. Remove the water layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to stand for a few min to ensure that all remaining water has been removed. Filter, collect the filtrate in a 20-mL volumetric flask, add 0.2 mL of *Internal standard solution*, and dilute with dichloromethane to volume.

**Sample solution:** Transfer 1.0 g of Amantadine Hydrochloride to a separator. Add 20 mL of 5.0 N sodium hydroxide and 18 mL of dichloromethane, and shake for 10 min. Remove the water layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to stand for a few min to ensure that all remaining water has been removed. Filter, collect the filtrate in a 20-mL volumetric flask, add 0.2 mL of *Internal standard solution*, and dilute with dichloromethane to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Detector temperature:** 300°

**Column:** 0.53-mm × 30-m fused-silica column coated with 1.0-μm G27 stationary phase

**Column temperature:** See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	0	70	5
70	10	250	At least 17

**Carrier gas:** Helium

**Flow rate:** 4 mL/min

**Injection size:** 2 μL

**Injector temperature:** 220°

**Injection type:**

**Split flow:** 200 mL/min

**Split flow ratio:** 50:1

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for adamantane and amantadine are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 20 between adamantane and amantadine

**Relative standard deviation:** NMT 5.0% determined from the peak response ratios of amantadine to adamantane

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ) taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of each impurity to adamantane from the *Sample solution*

$R_S$  = peak response ratio of amantadine to adamantane from the *Standard solution*

$C_S$  = concentration of USP Amantadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** NMT 0.3%

**Total impurities:** NMT 1.0%

**SPECIFIC TESTS**• **PH (791)**

**Sample:** 0.2 g/mL in water

**Acceptance criteria:** 3.0–5.5

• **CLARITY AND COLOR OF SOLUTION**

**Sample:** Dissolve 2 g in 10 mL of water.

**Acceptance criteria:** Solution is clear and nearly colorless.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**

USP Amantadine Hydrochloride RS

**Amantadine Hydrochloride Capsules****DEFINITION**

Amantadine Hydrochloride Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ).

**IDENTIFICATION**• **INFRARED ABSORPTION (197S)**

**Cell:** 1 mm

**Sample solution:** Place the contents of Capsules, equivalent to 200 mg of amantadine hydrochloride, in a vessel, dissolve in 0.1 N hydrochloric acid, and filter. Transfer the filtrate to a separator, add 1 mL of 5 N sodium hydroxide, and extract with 5 mL of methylene chloride. Filter the extract through anhydrous sodium sulfate, and rinse the anhydrous sodium sulfate with 2 mL of methylene chloride.

**ASSAY**• **PROCEDURE**

**Internal standard solution:** 0.4 mg/mL of naphthalene in hexane

**Standard stock solution:** 2 mg/mL of USP Amantadine Hydrochloride RS in water

**Standard solution:** Pipet 25.0 mL of *Standard stock solution* into a 250-mL separator, and add 25 mL of 2.0 N sodium hydroxide and 50.0 mL of *Internal standard solution*. Shake for 60 min, and collect the hexane layer (*Standard solution*).

**Sample solution:** Transfer NLT 20 Capsules to a 200-mL volumetric flask. Add 40 mL of 0.1 N hydrochloric acid, and heat gently to achieve complete dissolution. Cool, and dilute with water to volume. Pipet 5.0 mL of the solution into a 250-mL separator, and add 40 mL of 1.0 N sodium hydroxide and 50.0 mL of *Internal standard solution*. Shake for 60 min, and collect the hexane layer (*Sample solution*).

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 2-mm  $\times$  1.22-m; glass column packed with 10% phase G1 on 100- to 120-mesh support S1A

**Temperature**

**Column:** 115°

**Injector:** 250°

**Detector block:** 250°

**Injection size:** 1  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2 between naphthalene and amantadine

**Tailing factor:** NMT 2.0 for the analyte peak

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{10}H_{17}N \cdot HCl$  in the portion taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratios from the *Sample solution*

$R_S$  = peak response ratios from the *Standard solution*

$C_S$  = concentration of USP Amantadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–105.0%

**PERFORMANCE TESTS**• **DISSOLUTION (711)**

**Test 1:** Procedure for a Pooled Sample

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Internal standard solution:** 0.054 mg/mL of naphthalene in hexane

**Standard stock solution:** 0.1 mg/mL of USP Amantadine Hydrochloride RS in water

**Standard solution:** Pipet 15.0 mL of *Standard stock solution* into a 50-mL screw-capped test tube, add 5.0 mL of 5 N sodium hydroxide and 10.0 mL of *Internal standard solution*, and shake for 60 min. Collect the hexane layer.

**Sample solution:** Filter 15.0 mL of the solution under test, and place into a 50-mL screw-capped test tube. Pipet 5.0 mL of 5 N sodium hydroxide and 10.0 mL of the *Internal standard solution* into the test tube, and shake for 60 min. Collect the hexane layer (*Sample solution*).

**Chromatographic system:** Proceed as directed in the *Assay*.

**Injection size:** 2.5  $\mu$ L

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** NLT 75% (Q) of the labeled amount of  $C_{10}H_{17}N \cdot HCl$  is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** Water; 900 mL

**Apparatus 2:** 75 rpm, with sinkers. [NOTE—A suitable sinker is available as catalog number CAPWHT-2S from [www.qia-lc.com](http://www.qia-lc.com) or [www.tabletdissolution.com](http://www.tabletdissolution.com) or [www.labhut.com](http://www.labhut.com).]

**Time:** 45 min

**Internal standard solution:** 0.06 mg/mL of naphthalene in hexanes

**Standard stock solution:** 0.12 mg/mL of USP Amantadine Hydrochloride RS in *Medium*

**Standard solution:** Transfer 60.0 mL of the *Standard stock solution* to a 200-mL volumetric flask. Add 20 mL of 5 N sodium hydroxide and 40.0 mL of *Internal standard solution*. Shake the flask for approximately 10 min, and allow the layers to separate. Use the top layer for injection. The final concentration is about 0.18 mg/mL.

**Sample solution:** Transfer 3.0 mL of the solution under test to a centrifuge tube. Add 1.0 mL of 5 N sodium hydroxide and 2.0 mL of *Internal standard solution*. Shake the tube for approximately 10 min, and allow the layers to separate. Use the top layer for injection.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm × 30-m, 0.25-μm film, phase G1

**Temperature**

**Oven:** 100° for 3 min, to 200° at 10°/min, held at 200° for 2 min

**Injector:** 250°

**Detector:** 300°

**Carrier gas:** Helium, 1.4 mL/min

**Flow rate:** 20 mL/min

**Injection size:** 2 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2 between naphthalene and amantadine hydrochloride

**Tailing factor:** NMT 2.0 for amantadine hydrochloride

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amantadine hydrochloride released:

$$\text{Result} = (R_U/R_S) \times (C_S/L) \times V \times 100$$

$R_U$  = ratio of the peak areas from the *Sample solution*

$R_S$  = average ratio of the peak areas from the *Standard solution*

$C_S$  = concentration of amantadine hydrochloride in the *Standard stock solution* (mg/mL)

$L$  = label claim (mg/capsule)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of amantadine hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

#### • USP REFERENCE STANDARDS (11)

USP Amantadine Hydrochloride RS

### Amantadine Hydrochloride Oral Solution

» Amantadine Hydrochloride Oral Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ).

**Packaging and storage—**Preserve in tight containers.

#### USP Reference standards (11)—

USP Amantadine Hydrochloride RS

#### Identification, Infrared Absorption (197S)—

*Cell:* 1 mm.

**Solution—**Place a volume of Oral Solution, equivalent to about 200 mg of amantadine hydrochloride, in a vessel, dissolve in 0.1 N hydrochloric acid, and filter. Transfer the filtrate to a separator, add 10 mL of 0.5 N sodium hydroxide, and extract with 5 mL of methylene chloride. Filter the extract through anhydrous sodium sulfate, and rinse the anhydrous sodium sulfate with 2 mL of methylene chloride.

#### Assay—

**Internal standard solution, Standard preparation, and Chromatographic system—**Proceed as directed in the Assay under *Amantadine Hydrochloride Capsules*.

**Assay preparation—**Pipet 5.0 mL of the Oral Solution into a 250-mL conical flask, and add 45 mL of 1.0 N sodium hydroxide and 50.0 mL of *Internal standard solution*. Shake for 60 minutes, and collect the hexane layer (*Assay preparation*).

**Procedure—**Proceed as directed in the Assay under *Amantadine Hydrochloride Capsules*. Calculate the quantity, in mg, of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ) in the portion of Oral Solution taken by the formula:

$$50C(R_U/R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amantadine Hydrochloride RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Amcinonide

$C_{28}H_{35}FO_7$

502.57

Pregna-1,4-diene-3,20-dione, 21-(acetyloxy)-16,17-[cyclopentylidenebis(oxy)]-9-fluoro-11-hydroxy-, (11β, 16α)-;

9-Fluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione cyclic 16,17-acetal with cyclopentanone, 21-acetate [51022-69-6].

**DEFINITION**

Amcinonide contains NLT 97.0% and NMT 102.0% of amcinonide ( $C_{28}H_{35}FO_7$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)  
Analytical wavelength: 238 nm  
Sample solution: 40 µg/mL in methanol  
Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

**ASSAY**

- **PROCEDURE**  
Solution A: Acetonitrile and water (7:13)  
Solution B: Acetonitrile and water (7:3)  
System suitability solution: 12.5 µg/mL of butylparaben and 20 µg/mL of USP Amcinonide RS in Solution B  
Standard solution: 0.02 mg/mL of USP Amcinonide RS in Solution B  
Sample solution: 0.02 mg/mL of Amcinonide in Solution B. Sonicate for 5 min.  
Mobile phase: See Table 1. Equilibrate the system with Solution A.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2.5	100	0
10	0	100

**Chromatographic system**

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

**System suitability**

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for butylparaben and amcinonide are 0.78 and 1.0, respectively.]

**Suitability requirements**

Resolution: NLT 8.0 between butylparaben and amcinonide, System suitability solution

Tailing factor: NMT 1.5, Standard solution

Relative standard deviation: NMT 2.0%, Standard solution

**Analysis**

Samples: Standard solution and Sample solution

Calculate the percentage of amcinonide ( $C_{28}H_{35}FO_7$ ) in the portion of Amcinonide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Amcinonide RS in the Standard solution (mg/mL)

$C_U$  = concentration of the Sample solution (mg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

**IMPURITIES****Delete the following:**

- **HEAVY METALS, Method II** (231): NMT 20 ppm (Official 1-Jan-2018)

**SPECIFIC TESTS**

- **OPTICAL ROTATION, Specific Rotation** (781S)  
Sample solution: 10 mg/mL in chloroform  
Acceptance criteria: +89.4° to +94.0°
- **LOSS ON DRYING** (731)  
Sample: Amcinonide  
Analysis: Dry the Sample at 105° for 4 h.  
Acceptance criteria: NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Amcinonide RS

**Amcinonide Cream****DEFINITION**

Amcinonide Cream is Amcinonide in a suitable cream base. It contains NLT 90.0% and NMT 115.0% of the labeled amount of amcinonide ( $C_{28}H_{35}FO_7$ ).

**IDENTIFICATION**• **A. THIN-LAYER CHROMATOGRAPHY**

Standard solution: 100 µg/mL of USP Amcinonide RS in chloroform

Sample solution: Place 2 g of Cream in a 150-mL beaker, add 50 mL of chloroform and 15 g of anhydrous sodium sulfate, and stir with a glass rod to dissolve the specimen. Filter the solution, and clarify the filtrate, if necessary, by the further addition of anhydrous sodium sulfate and a second filtration. Evaporate the filtrate to dryness, and dissolve the residue in chloroform to obtain a solution containing 100 µg/mL of amcinonide.

**Chromatographic system**

(See Chromatography (621), Thin-Layer Chromatography.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 25 µL

Developing solvent: Ether

Visualization: Short wavelength UV

**Analysis**

Samples: Standard solution and Sample solution

Apply the Samples on a line parallel to and 3 cm from the bottom edge of the plate. Develop the chromatogram until the solvent front has moved about 12 cm above the line of application.

Acceptance criteria: The intensity and the  $R_f$  value of the principal spot of the Sample solution are similar to those of the Standard solution.

**ASSAY**• **PROCEDURE**

Solution A: Acetonitrile and water (7:13)

Solution B: Acetonitrile and water (7:3)

Standard solution: 0.02 mg/mL of USP Amcinonide RS in Solution B

System suitability solution: 12.5 µg/mL of butylparaben and 20 µg/mL of USP Amcinonide RS in Solution B

Sample stock solution: 0.2 mg/mL of amcinonide prepared as follows. Transfer a quantity of Cream, equivalent to 10 mg of amcinonide, to a 50-mL volumetric flask. Add 5 mL of Solution B and 15 mL of acetonitrile, and heat over a steam bath until dissolved. Add 20 mL of Solution B while hot, cool to room temperature, dilute with Solution B to volume, and refrigerate for 30 min. Vigorously shake the solution to disperse the mixture, and filter while cold. Use the filtrate.

**Sample solution:** 0.02 mg/mL of amcinonide in *Solution B* from the *Standard stock solution*  
**Mobile phase:** See *Table 1*. Equilibrate the system with *Solution A*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2.5	100	0
10	0	100

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 10 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for butylparaben and amcinonide are 0.78 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 8.0 between butylparaben and amcinonide, *System suitability solution*

**Tailing factor:** NMT 1.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amcinonide ( $C_{28}H_{35}FO_7$ ) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amcinonide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amcinonide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–115.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL** (755): Meets the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
- **pH** (791): 3.5–5.2

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Amcinonide RS

**Amcinonide Ointment**

» Amcinonide Ointment is Amcinonide in a suitable ointment base. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of amcinonide ( $C_{28}H_{35}FO_7$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Amcinonide RS

**Identification**—It meets the requirements for the *Identification* test under *Amcinonide Cream*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—

*Solution A*, *Solution B*, *Mobile phase*, *System suitability solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Amcinonide*, except to use a 240-nm detector.

**Assay preparation**—Dissolve an accurately weighed quantity of Ointment in a suitable volume of a mixture of acetonitrile and chloroform (4:1) by heating in a hot water bath, cooling, and adjusting quantitatively with the same solvent mixture to obtain a solution having a concentration of about 0.2 mg of amcinonide per mL. Cool to room temperature, dilute with acetonitrile to volume, and filter. Transfer 5 mL of this solution to a 50-mL volumetric flask, dilute with *Solution B* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of amcinonide ( $C_{28}H_{35}FO_7$ ) in the portion of Ointment taken by the formula:

$$500C(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Amcinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Amifostine**

$C_5H_{15}N_2O_3PS \cdot 3H_2O$  268.27

Ethanesithiol, 2-[(3-aminopropyl)amino]-, dihydrogen phosphate (ester), trihydrate;

S-[2-(3-Aminopropyl)amino]ethyl]dihydrogen phosphorothioate, trihydrate [112901-68-5].

**DEFINITION**

Amifostine contains NLT 78.0% and NMT 82.0% of  $C_5H_{15}N_2O_3PS$ , calculated on the as-is basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer:** 0.94 g/L of sodium 1-hexanesulfonate. Adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** Methanol and Buffer (7:18)  
**Standard solution:** 3 mg/mL of USP Amifostine RS in water. [NOTE—Inject immediately after preparation.]  
**Sample solution:** 3 mg/mL of Amifostine in water. [NOTE—Inject immediately after preparation.]

## PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE 1

**Mobile phase and Chromatographic system:** Proceed as directed in the Assay.

**Standard solution 1:** 70 μg/mL of USP Amifostine Thiol RS in water

**Standard solution 2:** 15 μg/mL of sodium thiophosphate and 13 μg/mL of N,N-dimethylformamide in water. [NOTE—The retention times of sodium thiophosphate and N,N-dimethylformamide are about 2 min and about 3.6 min, respectively.]

**Sample solution:** 2.4 mg/mL of amifostine from Amifostine for Injection in water. [NOTE—Inject immediately after preparation.]

**System suitability**

Samples: Standard solution 1 and Standard solution 2

Suitability requirements

Relative standard deviation: NMT 10.0%, Standard solution 1; NMT 4.0%, Standard solution 2

Analysis

Samples: Standard solution 1, Standard solution 2, and Sample solution

Calculate the percentage of amifostine thiol in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of amifostine thiol from the Sample solution

$r_S$  = peak response of amifostine thiol from Standard solution 1

$C_S$  = concentration of USP Amifostine Thiol RS in Standard solution 1 (mg/mL)

$C_U$  = concentration of amifostine in the Sample solution (mg/mL)

$M_{r1}$  = molecular weight of amifostine thiol, 134.24

$M_{r2}$  = molecular weight of amifostine thiol dihydrochloride, 207.17

Calculate the percentage of sodium thiophosphate or N,N-dimethylformamide in the portion of sample taken, if present:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of sodium thiophosphate or N,N-dimethylformamide from the Sample solution

$r_S$  = peak response of sodium thiophosphate or N,N-dimethylformamide from Standard solution 2

$C_S$  = concentration of sodium thiophosphate or N,N-dimethylformamide in Standard solution 2 (mg/mL)

$C_U$  = concentration of amifostine in the Sample solution (mg/mL)

Calculate the percentage of any other individual, unspecified impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each individual impurity in the Sample solution

$r_T$  = total of all peak responses in the Sample solution

**Acceptance criteria:** NMT 0.1% of sodium thiophosphate; NMT 0.088% of N,N-dimethylformamide; NMT 0.1% of any other individual unspecified impurity

#### • PROCEDURE 2

**Buffer:** 0.4 g/L of sodium 1-octanesulfonate. Adjust with trifluoroacetic acid to a pH of 2.5 ± 0.1.

**Mobile phase:** Acetonitrile and Buffer (1:3)

**Standard solution:** 46 μg/mL of USP Amifostine Disulfide RS in water

**Sample solution:** Dilute a quantity of Amifostine for Injection in water to prepare a solution equivalent to 10 mg/mL. [NOTE—Inject immediately after preparation.]

**Chromatographic system**

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 247 nm

Injection size: 10 μL

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2.5

Relative standard deviation: NMT 4.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of amifostine disulfide in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of amifostine disulfide from the Sample solution

$r_S$  = peak response of amifostine disulfide from the Standard solution

$C_S$  = concentration of USP Amifostine Disulfide RS in the Standard solution (mg/mL)

$C_U$  = concentration of amifostine in the Sample solution (mg/mL)

$M_{r1}$  = molecular weight of amifostine disulfide, 266.47

$M_{r2}$  = molecular weight of amifostine disulfide tetrahydrochloride, 412.31

**Acceptance criteria:** NMT 2.0% of total impurities, including amifostine thiol and amifostine disulfide

## SPECIFIC TESTS

- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests*, *Completeness and clarity of solutions*. When constituted with 0.9% Sodium Chloride Injection, the solution must completely dissolve in 45 s.

- **X-RAY DIFFRACTION (941):** Its X-ray diffraction pattern conforms to that of USP Amifostine RS, similarly determined.
- **STERILITY TESTS (71):** It meets the requirements when tested as directed for *Test for Sterility of the Product to be Examined, Membrane Filtration*.
- **PH (791):** 6.5–7.5, in a solution constituted as directed in the labeling.
- **WATER DETERMINATION, Method 1c (921)**  
**Sample solution:** To 100.0 mg of Amifostine for Injection, contained in a stoppered centrifuge tube, add 10.0 mL of a solution of *N*-ethylmaleimide in methanol (4 in 100), and sonicate for 15 min. Shake to disperse, and sonicate for an additional 15 min. Use 1.0 mL of the supernatant.  
**Acceptance criteria:** 18.0%–22.0%
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **BACTERIAL ENDOTOXINS TEST (85):** Contains NMT 0.2 USP Endotoxin Unit/mg of amifostine
- **OTHER REQUIREMENTS:** Meets the requirements for *Labeling (7), Labels and Labeling for Injectable Products*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements (659), Injection Packaging*, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**

## Amikacin

$C_{22}H_{43}N_5O_{13}$  585.60  
 D-Streptamine, O-3-amino-3-deoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 6)-O-[6-amino-6-deoxy- $\alpha$ -D-glucopyranosyl(1 $\rightarrow$ 4)]-N<sup>1</sup>-(4-amino-2-hydroxy-1-oxobutyl)-2-deoxy-, (S)-;  
 O-3-Amino-3-deoxy- $\alpha$ -D-glucopyranosyl(1 $\rightarrow$ 4)-O-[6-amino-6-deoxy- $\alpha$ -D-glucopyranosyl(1 $\rightarrow$ 6)]-N<sup>3</sup>-(4-amino-2-hydroxybutyl)-2-deoxy-L-streptamine [37517-28-5].

**DEFINITION**

Amikacin has a potency of NLT 900  $\mu$ g/mg of  $C_{22}H_{43}N_5O_{13}$ , calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the peak for amikacin of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****PROCEDURE**

**Mobile phase:** 0.115 N sodium hydroxide  
**System suitability solution:** 0.02 mg/mL of USP Amikacin RS and 0.008 mg/mL of USP Kanamycin Sulfate RS in water  
**Standard solution:** 0.02 mg/mL of USP Amikacin RS in water  
**Sample solution:** 0.02 mg/mL of Amikacin in water  
**Chromatographic system**  
 (See *Chromatography (621), System Suitability*.)  
**Mode:** LC  
**Detector:** Electrochemical  
**Detector mode:** Integrated amperometric mode  
**Electrodes**  
**Working:** Gold  
**Reference:** Silver-silver chloride  
**Detector settings:** See Table 1.

Table 1

Potential		Time (ms)

E <sub>2</sub>	0.8	190
E <sub>3</sub>	-0.8	190

**Columns**

**Guard:** Packing L47

**Analytical:** 4-mm  $\times$  25-cm; 10- $\mu$ m packing L47

**Flow rate:** 0.5 mL/min

**Injection size:** 20  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for kanamycin and amikacin are 0.8 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3 between kanamycin and amikacin, *System suitability solution*

**Tailing factor:** NMT 2, *Standard solution*

**Relative standard deviation:** NMT 3%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in  $\mu$ g, of amikacin ( $C_{22}H_{43}N_5O_{13}$ ) in each mg of Amikacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Amikacin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

$P$  = potency of amikacin in USP Amikacin RS (mg/mg)

$F$  = conversion factor, 1000  $\mu$ g/mg

**Acceptance criteria:** NLT 900  $\mu$ g/mg on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION (281):** NMT 1.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid

**SPECIFIC TESTS**

- **OPTICAL ROTATION, Specific Rotation (781S)**

**Sample solution:** 20 mg/mL in water

**Acceptance criteria:** +97° to +105°

Table 3

Ratio of Amikacin:H <sub>2</sub> SO <sub>4</sub>	Acceptance Criteria
1:2	2.0–4.0
1:1.8	6.0–7.3

- **LOSS ON DRYING (731):** Dry 100 mg in a vacuum at a pressure not exceeding 5 mm of mercury at 110° for 3 h; it loses NMT 13.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate whether its molar ratio of amikacin to H<sub>2</sub>SO<sub>4</sub> is 1:2 or 1:1.8.
- **USP REFERENCE STANDARDS (11)**
  - USP Amikacin RS
  - USP Amikacin Sulfate RS
  - USP Kanamycin Sulfate RS

**Amikacin Sulfate Injection****DEFINITION**

Amikacin Sulfate Injection is a sterile solution of Amikacin Sulfate in Water for Injection, or of Amikacin in Water for Injection prepared with the aid of Sulfuric Acid. It contains NLT 90.0% and NMT 120.0% of the labeled amount of amikacin (C<sub>22</sub>H<sub>43</sub>N<sub>5</sub>O<sub>13</sub>).

**IDENTIFICATION**

- **A.** The retention time of the peak for amikacin of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Mobile phase:** 0.115 N sodium hydroxide  
**System suitability solution:** 0.02 mg/mL of USP Amikacin RS and 0.008 mg/mL of USP Kanamycin Sulfate RS in water  
**Standard solution:** 0.02 mg/mL of USP Amikacin RS in water  
**Sample solution:** 0.02 mg/mL of amikacin, from the Injection in water  
**Chromatographic system**  
 (See Chromatography (621), *System Suitability*.)  
**Mode:** LC  
**Detector:** Electrochemical  
**Detector mode:** Integrated amperometric mode  
**Electrodes**  
**Working:** Gold

**Guard:** Packing L47  
**Analytical:** 4-mm × 25-cm; 10-μm packing L47  
**Flow rate:** 0.5 mL/min  
**Injection size:** 20 μL  
**System suitability**  
**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for kanamycin and amikacin are 0.8 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3 between kanamycin and amikacin, *System suitability solution*

**Tailing factor:** NMT 2, *Standard solution*

**Relative standard deviation:** NMT 3%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amikacin (C<sub>22</sub>H<sub>43</sub>N<sub>5</sub>O<sub>13</sub>) in each mL of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

$r_U$  = peak area from the *Sample solution*  
 $r_S$  = peak area from the *Standard solution*  
 $C_S$  = concentration of USP Amikacin RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of amikacin in the *Sample solution*  
 $P$  = potency of amikacin in USP Amikacin RS (mg/mg)

**Acceptance criteria:** 90.0%–120.0%

**SPECIFIC TESTS**

- **PH (791):** 3.5–5.5
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.33 USP Endotoxin Unit/mg of amikacin
- **OTHER REQUIREMENTS:** Meets the requirements under *Injections and Implanted Drug Products (1)*

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type III glass.
- **USP REFERENCE STANDARDS (11)**
  - USP Amikacin RS
  - USP Endotoxin RS
  - USP Kanamycin Sulfate RS

**Amiloride Hydrochloride**

C<sub>6</sub>H<sub>8</sub>ClN<sub>7</sub>O · HCl · 2H<sub>2</sub>O 302.12  
 Pyrazinecarboxamide, 3,5-diamino-N-(aminoiminomethyl)-6-chloro-, monohydrochloride dihydrate;  
 N-Amidino-3,5-diamino-6-chloropyrazinecarboxamide monohydrochloride dihydrate [17440-83-4].

**DEFINITION**

Amiloride Hydrochloride contains NLT 98.0% and NMT 101.0% of C<sub>6</sub>H<sub>8</sub>ClN<sub>7</sub>O · HCl, calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197M)**
- **B. ULTRAVIOLET ABSORPTION (197U)**  
**Sample:** 600 μg/mL of water, diluted quantitatively and stepwise with 0.1 N hydrochloric acid to a concentration of about 9.6 μg/mL  
**Acceptance criteria:** Meets the requirements
- **C. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements

**ASSAY****• PROCEDURE**

**Sample:** 450 mg

**Analysis:** Dissolve the *Sample* in 100 mL of glacial acetic acid, add 10 mL of mercuric acetate TS and 15 mL of dioxane. Add crystal violet TS. Titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 26.61 mg of  $C_6H_8ClN_7O \cdot HCl$ .

**Acceptance criteria:** 98.0%–101.0% on the dried basis

**IMPURITIES**

- RESIDUE ON IGNITION (281):** NMT 0.1%

**Delete the following:**

- HEAVY METALS, Method II (231):** NMT 20 ppm (Official 1-Jan-2018)

**• ORGANIC IMPURITIES**

**Standard solutions:** Prepare a series of solutions, A, B, C, D, E, and F, of USP Amiloride Hydrochloride RS in a mixture of methanol and chloroform (4:1) having concentrations of 4000, 40, 20, 8, 4, and 2 µg/mL, respectively.

**Sample solution:** 4 mg/mL of Amiloride Hydrochloride in methanol and chloroform (4:1)

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel previously washed with methanol

**Application volume:** 5 µL

**Developing solvent system:** Tetrahydrofuran and 3 N ammonium hydroxide (15:2)

**Analysis**

**Samples:** *Standard solutions* A, B, C, D, E, and F and *Sample solution*

Proceed as directed in the chapter. Dry the spots with a stream of nitrogen, and develop the chromatograms in the solvent system, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow to air-dry, and examine the plate under long-wavelength UV light: the  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of *Standard solution* A. Estimate the levels of any additional spots observed in the chromatogram of the *Sample solution* by comparison with the principal spots in the chromatograms of *Standard solutions* B, C, D, E, and F.

**Acceptance criteria:** The sum of the intensities of any additional spots observed is NMT that of the principal spot obtained from *Standard solution* B (equivalent to 1%).

**SPECIFIC TESTS****• ACIDITY**

**Sample:** 1.0 g

**Analysis:** Dissolve the *Sample* in 100 mL of a mixture of methanol and water (1:1). Titrate with 0.10 N sodium hydroxide to a potentiometric endpoint.

**Acceptance criteria:** NMT 0.30 mL is required (0.1% as HCl).

**• LOSS ON DRYING**

(See *Thermal Analysis* (891).)

[NOTE—The quantity taken for the determination may be adjusted, if necessary, for instrument sensitivity.]

**Sample:** 10 mg

**Analysis:** Determine the percentage of volatile substances by thermogravimetric analysis on an appropriately calibrated instrument using the *Sample*. Heat the specimen at the rate of 10°/min between ambient tem-

perature and 225° in an atmosphere of nitrogen at a flow rate of 40 mL/min. From the thermogram determine the accumulated loss in weight between ambient temperature and about 200° on the plateau.

**Acceptance criteria:** 11.0%–13.0%

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in well-closed containers.

- USP REFERENCE STANDARDS (11)**  
USP Amiloride Hydrochloride RS

**Amiloride Hydrochloride Tablets****DEFINITION**

Amiloride Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ).

**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- B.**

**Standard solution:** 0.2 mg/mL of USP Amiloride Hydrochloride RS in methanol

**Sample solution:** Prepare from finely ground Tablets, equivalent to 0.2 mg/mL of amiloride hydrochloride in methanol. Filter the solution.

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Developing solvent system:** Tetrahydrofuran and 3 N ammonium hydroxide (88:12)

**Application volume:** 10 µL

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Develop the plate until the solvent is about three-fourths of the length of the plate from the origin. Remove the plate from the developing chamber, air-dry, and examine under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

**ASSAY****• PROCEDURE**

**Buffer:** Dissolve 136 g of monobasic potassium phosphate in 800 mL of water. Adjust with phosphoric acid to a pH of 3.0. Dilute with water to 1000 mL.

**Mobile phase:** Methanol, water, and *Buffer* (25:71:4)

**Standard stock solution:** 1.0 mg/mL of USP Amiloride Hydrochloride RS in methanol

**Standard solution:** 0.1 mg/mL of USP Amiloride Hydrochloride RS from *Standard stock solution*, prepared as follows. Transfer 5.0 mL of the *Standard stock solution* to a 50-mL volumetric flask. Add 10.0 mL of methanol, 2.0 mL of 0.1 N hydrochloric acid, and dilute with water to volume.

**Sample solution:** Transfer an amount equivalent to 5 mg of amiloride hydrochloride, from NLT 20 finely powdered Tablets, to a 50-mL volumetric flask containing 15.0 mL of methanol and 2.0 mL of 0.1 N hydrochloric acid. Sonicate for 10 min, dilute with water to volume, sonicate for an additional 10 min, and filter.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 286 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amiloride from the *Sample solution*

$r_S$  = peak response of amiloride from the *Standard solution*

$C_S$  = concentration of USP Amiloride Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amiloride hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Instrumental conditions

Mode: UV

Analytical wavelength: 363 nm

Standard solution: USP Amiloride Hydrochloride RS of known concentration in *Medium*. [NOTE—An amount of methanol not to exceed 2% of the total volume of the *Standard solution* may be used to dissolve the amiloride hydrochloride.]

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* as necessary.

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: NLT 80% (Q) of the labeled amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Standard solution: 10 µg/mL of USP Amiloride Hydrochloride RS in 0.1 N hydrochloric acid

Sample solution: 10 µg/mL of amiloride hydrochloride prepared as follows. Transfer one finely powdered Tablet to a 100-mL volumetric flask, add 60 mL of 0.1 N hydrochloric acid, and shake by mechanical means for 30 min. Dilute with 0.1 N hydrochloric acid to volume, and centrifuge a portion of the mixture. Dilute a portion of the clear supernatant to obtain the required concentration.

Instrumental conditions

Mode: UV

Analytical wavelength: 363 nm

Blank: 0.1 N hydrochloric acid

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of amiloride hydrochloride in the *Sample solution*

$A_S$  = absorbance of amiloride hydrochloride in the *Standard solution*

$C_S$  = concentration of USP Amiloride Hydrochloride RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of amiloride hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: Meet the requirements

## IMPURITIES

### • ORGANIC IMPURITIES

Diluent: Methanol, 1 N hydrochloric acid, and water (40:4:56)

Buffer: 0.9 g/L of sodium 1-hexanesulfonate in water. Initially add water to about 90% of the volume of the flask, adjust with diluted phosphoric acid to a pH of 3.0 ± 0.1, and dilute with water to volume.

Mobile phase: Acetonitrile and *Buffer* (10:90)

Standard solution: 0.01 mg/mL of USP Amiloride Hydrochloride RS in *Diluent*

Sample solution: Nominally equivalent to 2 mg/mL of amiloride hydrochloride in *Diluent* from NLT 20 powdered Tablets. Initially add methanol to fill about 40% of the volume of the flask and 1 N hydrochloric acid to about 4% of the volume of the flask. Sonicate for 10 min, dilute with water to volume, and sonicate for another 10 min. Pass through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 350 nm

Column: 4.6-mm × 15-cm; 4-µm packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of amiloride from the *Standard solution*

$C_S$  = concentration of USP Amiloride Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amiloride hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Chloropyrazine acid <sup>a,e</sup>	0.15	—
Chloropyrazine methyl carboxylate <sup>b,e</sup>	0.48	—
Chloropyrazine carboxamide <sup>c,e</sup>	0.56	—
Amiloride	1.00	—

Any other unknown impurity	—	0.5
Total impurities <sup>d</sup>	—	2.0

<sup>a</sup> 3,5,-Diamin-6-chloropyrazine carboxylic acid.

<sup>b</sup> 3,5,-Diamin-6-chloropyrazine-2-carboxylate.

<sup>c</sup> N-Ammidine-3-amino-5-hydroxy-6-chloropyrazine-2-carboxamide hydrochloride.

<sup>d</sup> Total impurities is the sum of all the impurities including process-related. Disregard peaks less than 0.05%.

<sup>e</sup> Process-related impurity, controlled in the drug substance.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**  
USP Amiloride Hydrochloride RS

## Amiloride Hydrochloride and Hydrochlorothiazide Tablets

### DEFINITION

Amiloride Hydrochloride and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) and hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ).

### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.
- **B. THIN-LAYER CHROMATOGRAPHY**  
**Standard solution A:** 0.2 mg/mL of USP Amiloride Hydrochloride RS in methanol  
**Standard solution B:** 2 mg/mL of USP Hydrochlorothiazide RS in methanol  
**Sample solution:** Equivalent to 0.2 mg/mL of amiloride hydrochloride from ground Tablets in methanol. Filter.  
**Chromatographic system**  
 (See Chromatography (621), Thin-Layer Chromatography.)  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture  
**Application volume:** 10  $\mu$ L  
**Developing solvent system:** Tetrahydrofuran and 3 N ammonium hydroxide (22:3)  
**Analysis**  
**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*  
 Develop the chromatogram until the solvent has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, air-dry, and examine under short-wavelength UV light.  
**Acceptance criteria:** The  $R_f$  values of the amiloride hydrochloride and hydrochlorothiazide spots of the *Sample solution* correspond to those of the corresponding *Standard solutions*.

### ASSAY

#### PROCEDURE

**Buffer:** 136 g of monobasic potassium phosphate in 800 mL of water. Adjust with phosphoric acid to a pH of 3.0. Dilute with water to 1000 mL.  
**Mobile phase:** Methanol, water, and *Buffer* (25:71:4)  
**Standard stock solution:** 1.0 mg/mL of USP Amiloride Hydrochloride RS in methanol

**Standard solution:** 0.1 mg/mL of USP Amiloride Hydrochloride RS and 1 mg/mL of USP Hydrochlorothiazide RS, prepared by transferring 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask containing 100 mg of USP Hydrochlorothiazide RS and 20.0 mL of methanol. Add 4.0 mL of 1 N hydrochloric acid, and dilute with water to volume.

**Sample solution:** Transfer an equivalent to 5 mg of amiloride hydrochloride from powdered Tablets (NLT 20) to a 50-mL volumetric flask. Add 15.0 mL of methanol and 2.0 mL of 1 N hydrochloric acid. Sonicate for 10 min, dilute with water to volume, sonicate for an additional 10 min, and filter.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for hydrochlorothiazide and amiloride hydrochloride are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between hydrochlorothiazide and amiloride hydrochloride

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amiloride hydrochloride from the *Sample solution*

$r_S$  = peak response of amiloride hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Amiloride Hydrochloride RS, corrected for loss in weight in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amiloride hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of hydrochlorothiazide from the *Sample solution*

$r_S$  = peak response of hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amounts of  $C_6H_8ClN_7O \cdot HCl$  and  $C_7H_8ClN_3O_4S_2$

### PERFORMANCE TESTS

#### DISSOLUTION (711)

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

Determine the amount of amiloride hydrochloride and hydrochlorothiazide dissolved using *Analytical procedure 1* or *procedure 2*.

#### Analytical procedure 1

**Amiloride standard solution:** 60 mg of USP Amiloride Hydrochloride RS (equivalent to 52 mg of anhydrous

amiloride hydrochloride) in a 200-mL volumetric flask. Dissolve in and dilute with methanol to volume. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume.

**Hydrochlorothiazide standard solution:** Transfer 100 mg of USP Hydrochlorothiazide RS to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, and dilute with *Medium* to volume.

**Sample solution A:** Pass a portion of the solution under test through a glass fiber filter of 0.45- $\mu$ m pore size.

**Sample solution B:** Transfer 5.0 mL of *Sample solution A* to a 25-mL volumetric flask, and dilute with *Medium* to volume.

**Detector:** UV 363 nm for amiloride hydrochloride, 270 nm for hydrochlorothiazide

**Blank:** *Medium*

#### Analysis

**Samples:** *Amiloride standard solution*, *Hydrochlorothiazide standard solution*, *Sample solution A*, and *Sample solution B*

Calculate the percentage of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) dissolved:

$$\text{Result} = [(A_U \times C_S \times V)/(A_S \times L)] \times 100$$

$A_U$  = absorbance of *Sample solution A*

$C_S$  = concentration of the *Amiloride standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$A_S$  = absorbance of the *Amiloride standard solution*

$L$  = label claim of amiloride (mg/Tablet)

Calculate the correction for the interference of amiloride:

$$A_{UC} = A_{U270} - [(A_{U363} \times F)/5]$$

$A_{UC}$  = corrected absorbance of *Sample solution A*, 270 nm

$A_{U270}$  = absorbance of *Sample solution B*, 270 nm

$A_{U363}$  = absorbance of *Sample solution A*, 363 nm

$$F = A_S \text{ at } 270 \text{ nm} / A_S \text{ at } 363 \text{ nm}$$

$A_S$  = absorbance of the *Amiloride standard solution*

Calculate the percentage of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = [(A_{UC} \times C_S \times V \times D)/(A_S \times L)] \times 100$$

$A_{UC}$  = corrected absorbance of *Sample solution A*, 270 nm

$C_S$  = concentration of the *Hydrochlorothiazide standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$D$  = dilution factor of *Sample solution B*, 25/5

$A_S$  = absorbance of the *Hydrochlorothiazide standard solution*

$L$  = label claim of hydrochlorothiazide (mg/Tablet)

#### Analytical procedure 2

**Buffer and Mobile phase:** Prepare as directed in the *Assay*.

**Standard stock solution:** Use the *Standard solution* from the *Assay*.

**Standard solution:** 5  $\mu$ g/mL of amiloride hydrochloride and 50  $\mu$ g/mL of hydrochlorothiazide from the *Standard stock solution*, in *Medium*

**Sample solution:** Pass a portion of the solution under test through a filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0% between hydrochlorothiazide and amiloride

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) and hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response of amiloride or hydrochlorothiazide from the *Sample solution*

$r_S$  = peak response of amiloride or hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of amiloride hydrochloride or hydrochlorothiazide in the *Standard solution* (mg/mL)

$L$  = label claim of amiloride hydrochloride or hydrochlorothiazide (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_6H_8ClN_7O \cdot HCl$  and NLT 75% (Q) of the labeled amount of  $C_7H_8ClN_3O_4S_2$  are dissolved.

- **UNIFORMITY OF DOSAGE UNITS, Content Uniformity (905):** Meet the requirements with respect to amiloride hydrochloride and hydrochlorothiazide

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Buffer, Mobile phase, and Sample solution:** Prepare as directed in the *Assay*.

**Standard solution:** 10  $\mu$ g/mL of USP Benzothiadiazine Related Compound A RS in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for hydrochlorothiazide and amiloride hydrochloride are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between hydrochlorothiazide and amiloride hydrochloride

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Sample solution* and *Standard solution*

Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

$r_U$  = peak response of benzothiadiazine related compound A from the *Sample solution*

$r_S$  = peak response of benzothiadiazine related compound A from the *Standard solution*

$C_S$  = concentration of USP Benzothiadiazine Related Compound A RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of benzothiadiazine in the *Sample solution* (mg/mL)

$F$  = unit conversion factor, 0.001 mg/μg  
Acceptance criteria: NMT 1.0%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
  - USP Amiloride Hydrochloride RS
  - USP Benzothiadiazine Related Compound A RS
  - 4-Amino-6-chloro-1,3-benzenedisulfonamide.
  - $C_6H_8ClN_3O_4S_2$  285.73
  - USP Hydrochlorothiazide RS

## Amiloxate

$C_{15}H_{20}O_3$  248.32  
4-Methoxycinnamic acid, isoamyl ester;  
3-Methylbutyl 3-(4-methoxyphenyl)-(E)-2-propenoate  
[71617-10-2].

### DEFINITION

Amiloxate contains NLT 98.0% and NMT 102.0% of amiloxate ( $C_{15}H_{20}O_3$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197F)**

**Change to read:**

- **B. ULTRAVIOLET ABSORPTION (197U)**  
Sample solution: 5.0 μg/mL in alcohol  
▲<sub>USP40</sub>

**Add the following:**

- ▲ **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲<sub>USP40</sub>

### ASSAY

**Change to read:**

- **PROCEDURE**  
Standard solution: 20 mg/mL of USP Amiloxate RS in *tert*-butyl methyl ether  
Sample solution: 20 mg/mL of Amiloxate in *tert*-butyl methyl ether  
**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)  
Mode: GC  
Detector: Flame ionization  
Column: 0.32-mm × 25-m; coated with a 0.1-μm film of phase G1  
Temperatures  
Injection port: 240°  
Detector: 260°  
Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
60	8	240	10

Carrier gas: Helium

Flow rate: 6 mL/min

Injection volume: 1 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 0.73% ▲<sub>USP40</sub>

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of amiloxate ( $C_{15}H_{20}O_3$ ) in the portion of Amiloxate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amiloxate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amiloxate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

### IMPURITIES

- **ORGANIC IMPURITIES**

Standard solution, *Sample solution*, *Chromatographic system*, and *System suitability*: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Amiloxate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_T$  = sum of all the peak responses, excluding the solvent peak, from the *Sample solution*

Acceptance criteria

Individual impurities: NMT 0.5%

Total impurities: NMT 2.0%

### SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 1.037–1.041
- **REFRACTIVE INDEX (831):** 1.556–1.560 at 20°

**Change to read:**

- **ACIDITY**

Sample solution: Transfer 50 mL of alcohol to a suitable container. Add 1 mL of phenolphthalein TS and sufficient 0.1 N sodium hydroxide to obtain a persistent pink color. Transfer 50 mL of this solution to a suitable container, and add 5.0 mL of Amiloxate.

Analysis: Titrate with 0.1 N sodium hydroxide

▲<sub>VS</sub> ▲<sub>USP40</sub>

Acceptance criteria: NMT 0.2 mL of titrant per mL of Amiloxate is required for neutralization.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**  
USP Amiloxate RS

## Aminobenzoate Potassium

Add the following:

▲

$C_7H_6KNO_2$  175.23  
Benzoic acid, 4-amino-, potassium salt;  
Potassium 4-aminobenzoate [138-84-1].▲USP40

### DEFINITION

Change to read:

Aminobenzoate Potassium contains NLT ▲98.0%▲USP40 and NMT ▲102.0%▲USP40 of aminobenzoate potassium ( $C_7H_6KNO_2$ ), calculated on the dried basis.

### IDENTIFICATION

Delete the following:

#### ▲ A. ULTRAVIOLET ABSORPTION (197U)

Solution: 10 µg/mL in 0.001 N sodium hydroxide  
Acceptance criteria: Meets the requirements.▲USP40

Add the following:

#### ▲ A. INFRARED ABSORPTION (197K)▲USP40

Delete the following:

#### ▲ B.

Sample: 400 mg

Analysis: Dissolve the Sample in 10 mL of water, add 1 mL of 3 N hydrochloric acid, filter, and wash the precipitate with two 5-mL portions of cold water. Recrystallize the precipitate from alcohol, and dry at 110° for 1 h.

Acceptance criteria: The resulting *p*-aminobenzoic acid melts between 186° and 189°.▲USP40

Add the following:

▲ B. The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.▲USP40

#### • C.

Sample solution: 10 mg/mL of Aminobenzoate Potassium in water

Acceptance criteria: The Sample solution imparts a violet color to a nonluminous flame. Since the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

• HEAVY METALS (231), Method II: NMT 0.002%● (Official 1-Jan-2018)

Delete the following:

#### ▲ VOLATILE DIAZOTIZABLE SUBSTANCES

Standard stock solution: 0.1 mg/mL of *p*-toluidine, prepared by dissolving a quantity of *p*-toluidine in 5% of the flask volume of methanol, and diluting with water to volume

**Standard solution:** 1 µg/mL of *p*-toluidine from the *Standard stock solution*

**Sample solution:** Transfer 5.0 g of Aminobenzoate Potassium to a suitable flask, and add a volume of 1.25 N sodium hydroxide that is just sufficient to dissolve the sample and to render the solution just alkaline to phenolphthalein TS. Dilute with water to 50 mL, and steam-distill the solution, collecting 95 mL of the distillate in a 100-mL volumetric flask. Dilute with water to volume.

**Blank:** Water

#### Instrumental conditions

**Mode:** Vis

**Analytical wavelength:** Wavelength of maximum absorbance at about 405 nm

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank solution*. Transfer 20.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* to three separate 100-mL beakers, and treat each as follows. Add 5.0 mL of 1 N hydrochloric acid, and cool in an ice bath. Add 2.0 mL of 0.1 M sodium nitrite dropwise, with stirring. Allow to stand for 5 min for the diazotization reaction to be complete, add quickly to 10.0 mL of a cold solution of guaiacol (freshly prepared by dissolving 0.20 g of guaiacol in 100 mL of 1 N sodium hydroxide), mix and allow to stand for 30 min. Concomitantly determine the absorbances of the solutions.

**Acceptance criteria:** The absorbance of the solution from the *Sample solution* does not exceed that of the solution from the *Standard solution*, corresponding to NMT 0.002% of volatile diazotizable substances as *p*-toluidine. ▲USP40

#### Add the following:

##### ▲• LIMIT OF ANILINE AND *p*-TOLUIDINE

**Diluent:** Methylene chloride

**Standard stock solution:** 0.1 mg/mL each of USP Aniline RS and USP *p*-Toluidine RS in *Diluent*

**Standard solution:** 1 µg/mL each of USP Aniline RS and USP *p*-Toluidine RS in *Diluent* from *Standard stock solution*

**Sample solution:** 100 mg/mL of Aminobenzoate Potassium in *Diluent* prepared as follows. Add an appropriate quantity of Aminobenzoate Potassium to a suitable volumetric flask and dilute with *Diluent* to volume. Agitate for 10 min on a shaker and centrifuge at 3000 rpm for 5 min. Use the supernatant.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

#### Detectors

**Flame ionization:** 300°

**Hydrogen:** 40 mL/min

**Air:** 400 mL/min

**Column:** 30-m × 0.32-mm fused silica capillary; coated with 0.5-µm film of phase G27

#### Temperatures

**Injection port:** 280°

**Detector:** 300°

**Column:** See *Table 1*.

## Aminobenzoate Potassium Capsules

#### DEFINITION

Aminobenzoate Potassium Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

#### IDENTIFICATION

##### • A.

Sample: 1 g of the Capsule contents

Analysis: Dissolve the Sample in 25 mL of water, add 5 mL of 3 N hydrochloric acid, and wash the precipitate with two 5-mL portions of cold water. Recrystallize from alcohol the precipitate so obtained, and dry at 110° for 1 h.

Acceptance criteria: The *p*-aminobenzoic acid melts between 186° and 189°.

#### Add the following:

▲• **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.▲USP40

#### ASSAY

#### Change to read:

##### • PROCEDURE

▲Solution A: 1.5% acetic acid prepared as follows. Mix 690 mL of water with 10 mL of acetic acid and pass through a filter of 0.45-μm pore size.

Mobile phase: Methanol and Solution A (15:85)

Standard solution: 0.1 mg/mL of USP Aminobenzoate Potassium RS in Mobile phase

Sample solution: Nominally 0.1 mg/mL of aminobenzoate potassium prepared as follows. Remove as completely as possible, and combine the contents of NLT 10 Capsules. Transfer a portion of the combined contents, equivalent to 10 mg of aminobenzoate potassium to a 100-mL volumetric flask, dissolve in 70 mL of Mobile phase, sonicate for 3–4 min, and dilute with Mobile phase to volume.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC  
 Detector: 280 nm  
 Column: 3.0-mm × 15-cm; 3.5-μm packing L11  
 Flow rate: 0.35 mL/min  
 Injection volume: 5 μL

#### System suitability

Sample: *Standard solution*

#### Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Aminobenzoate Potassium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aminobenzoate potassium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110%  $\Delta$ USP40

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

#### Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 270 nm

Standard solution: A known concentration of USP Aminobenzoate Potassium RS in *Medium*

Sample solution: Filter portions of the solution under test, and dilute with *Medium*, if necessary, in comparison with the *Standard solution* concentration.

Analysis: Calculate the percentage of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ) is dissolved.

##### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

#### IMPURITIES

##### Add the following:

##### ▲• ORGANIC IMPURITIES

Solution A, *Mobile phase*, and *Chromatographic system*: Prepare as directed in the *Assay*.

Standard solution: 1 μg/mL each of USP Aminobenzoate Potassium RS, USP 4-Nitrobenzoic Acid RS, and USP Benzocaine RS in *Mobile phase*

Sensitivity solution: 0.1 μg/mL of USP Aminobenzoate Potassium RS in *Mobile phase* from the *Standard solution*

Sample solution: Nominally 1 mg/mL of aminobenzoate potassium in *Mobile phase* prepared as follows. Remove as completely as possible, and combine, the contents of NLT 10 Capsules. Transfer a portion of the combined contents, equivalent to 10 mg of aminobenzoate potassium, to a 10-mL volumetric flask. Dissolve in 7 mL of *Mobile phase*, sonicate for 3–4 min, and dilute with *Mobile phase* to volume.

#### System suitability

Samples: *Standard solution* and *Sensitivity solution*

#### Suitability requirements

Resolution: NLT 1.5 between benzocaine and 4-nitrobenzoic acid, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual unspecified degradation product in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any individual unspecified degradation product from the *Sample solution*

$r_S$  = peak response of aminobenzoate from the *Standard solution*

$C_S$  = concentration of USP Aminobenzoate Potassium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aminobenzoate potassium in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Aminobenzoic acid	1.0	—
Benzocaine <sup>a</sup>	2.0	—
4-Nitrobenzoic acid <sup>a</sup>	2.1	—
Any individual unspecified degradation product	—	0.10
Total impurities	—	1.0

<sup>a</sup>These are process impurities controlled in the API and are included in this table for identification purposes only. They are not reported in the drug product and should not be included in the total impurities.

$\Delta$ USP40

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

#### Change to read:

##### • USP REFERENCE STANDARDS (11)

USP Aminobenzoate Potassium RS

$\Delta$ USP Benzocaine RS

USP 4-Nitrobenzoic Acid RS

4-Nitrobenzoic acid.

$C_7H_5NO_4$  167.12  $\Delta$ USP40

### Aminobenzoate Potassium for Oral Solution

» Aminobenzoate Potassium for Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Aminobenzoate Potassium RS

**Identification—****A: Ultraviolet Absorption** (197U)—**Solution:** 50 µg per mL.**Medium:** water.

**B:** Dissolve about 400 mg in 10 mL of water, add 1 mL of 3 N hydrochloric acid, filter, and wash the precipitate with two 5-mL portions of cold water. Recrystallize from alcohol the precipitate so obtained, and dry at 110° for 1 hour: the *p*-aminobenzoic acid so obtained melts between 186° and 189°.

**Minimum fill** (755)—

FOR SOLID PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 7.0 and 9.0, in a solution (1 in 10).

**Assay**—Transfer about 100 mg of Aminobenzoate Potassium for Oral Solution, accurately weighed, to a suitable vessel, add 5 mL of hydrochloric acid and 50 mL of water, mix, cool to 15°, and add 25 g of crushed ice. Titrate with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically, using a calomel-platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 17.52 mg of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

## Aminobenzoate Potassium Tablets

» Aminobenzoate Potassium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Aminobenzoate Potassium RS

**Identification**—Proceed as directed for *Aminobenzoate Potassium Capsules*, using 1 g of finely powdered Tablets.

**Dissolution** (711)—**Medium:** water; 900 mL.**Apparatus 1:** 100 rpm.**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_7H_6KNO_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 270 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Aminobenzoate Potassium RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_7H_6KNO_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Standard preparation**—Prepare a solution of USP Aminobenzoate Potassium RS having a known concentration of about 5 µg per mL.

**Assay preparation and Procedure**—Weigh and finely powder not fewer than 20 Tablets. Using a portion of the powdered Tablets, equivalent to about 100 mg of aminobenzoate potassium, proceed as directed in the *Assay* under *Aminobenzoate Potassium Capsules*.

## Aminobenzoate Sodium

**DEFINITION**

Aminobenzoate Sodium contains NLT 98.5% and NMT 101.0% of aminobenzoate sodium ( $C_7H_6NNaO_2$ ), calculated on the dried basis.

**IDENTIFICATION**• **A. ULTRAVIOLET ABSORPTION** (197U)**Solution:** 10 µg/mL**Medium:** 0.001 N sodium hydroxide**Acceptance criteria:** Meets the requirements• **B.**

**Sample:** Dissolve about 400 mg of Aminobenzoate Sodium in 10 mL of water, add 1 mL of 3 N hydrochloric acid, filter, and wash the precipitate with two 5-mL portions of cold water. Recrystallize the precipitate so obtained from alcohol, and dry at 110° for 1 h.

**Acceptance criteria:** The resulting *p*-aminobenzoic acid melts between 186° and 189°.

• **C.**

**Sample solution:** 10 mg/mL of Aminobenzoate Sodium in water

**Acceptance criteria:** The *Sample solution* imparts an intense yellow color to a nonluminous flame.

**ASSAY**• **PROCEDURE**

**Sample:** 500 mg of Aminobenzoate Sodium

**Titrimetric system****Mode:** Direct titration**Titrant:** 0.1 M sodium nitrite VS**Endpoint detection:** Potentiometric

**Analysis:** Add 25 mL of water and 25 mL of 3 N hydrochloric acid to the *Sample* in a suitable vessel, mix, and cool in an ice bath. Titrate with *Titrant* using a calomel-platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 15.91 mg of aminobenzoate sodium ( $C_7H_6NNaO_2$ ).

**Acceptance criteria:** 98.5%–101.0% on the dried basis

**IMPURITIES**• **CHLORIDE AND SULFATE** (221), *Chloride***Sample:** 1.4 g of Aminobenzoate Sodium

**Acceptance criteria:** The *Sample* shows no more chloride than corresponds to 0.4 mL of 0.020 N hydrochloric acid (0.02%).

• **CHLORIDE AND SULFATE** (221), *Sulfate***Sample:** 1.4 g of Aminobenzoate Sodium

**Acceptance criteria:** The *Sample* shows no more sulfate than corresponds to 0.3 mL of 0.020 N sulfuric acid (0.02%).

**Delete the following:**• **HEAVY METALS** (231), *Method II:* NMT 0.002% (Official 1-

Jan-2018)

• **VOLATILE DIAZOTIZABLE SUBSTANCES**

**Standard stock solution:** 0.1 mg/mL of *p*-toluidine, prepared as follows. Dissolve an adequate amount of *p*-toluidine in 5% of total volume of methanol in a suitable volumetric flask, and dilute with water to volume.

**Standard solution:** 1 µg/mL of *p*-toluidine in water from the *Standard stock solution*

**Sample solution:** Transfer 5.0 g of Aminobenzoate Sodium to a suitable flask, and add a volume of 1.25 N sodium hydroxide that is just sufficient to dissolve the sample and to render the solution just alkaline to phenolphthalein TS. Dilute with water to 50 mL, and steam-distill the solution, collecting 95 mL of the distillate in a 100-mL volumetric flask. Dilute with water to volume.

Blank: Water

Instrumental conditions

Mode: Vis

Analytical wavelength: Maximum absorbance at about 405 nm

Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*  
Transfer 20.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* to three separate 100-mL beakers, and treat each as follows. Add 5.0 mL of 1 N hydrochloric acid, and cool in an ice bath. Add 2.0 mL of 0.1 M sodium nitrite dropwise, with stirring. Allow to stand for 5 min for the diazotization reaction to be complete, add quickly to 10.0 mL of a cold solution of guaiacol (freshly prepared by dissolving 0.20 g of guaiacol in 100 mL of 1 N sodium hydroxide), and allow to stand for 30 min. Concomitantly determine the absorbances of the solutions.

**Acceptance criteria:** The absorbance of the *Sample solution* does not exceed that of the *Standard solution*, corresponding to NMT 0.002% of volatile diazotizable substances as *p*-toluidine.

## SPECIFIC TESTS

### • PH (791)

**Sample solution:** 50 mg/mL of Aminobenzoate Sodium in water

**Acceptance criteria:** 8.0–9.0

### • LOSS ON DRYING (731)

**Analysis:** Dry at 105° for 2 h.

**Acceptance criteria:** NMT 1.0%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**  
USP Aminobenzoate Sodium RS

## Aminobenzoic Acid

$C_7H_7NO_2$  137.14  
Benzoic acid, 4-amino;  
*p*-Aminobenzoic acid [150-13-0].

## DEFINITION

Aminobenzoic Acid contains NLT 98.0% and NMT 102.0% of aminobenzoic acid ( $C_7H_7NO_2$ ), calculated on the dried basis.

## IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### • PROCEDURE

**Acetic acid solution:** Glacial acetic acid and water (1:69)

**Mobile phase:** Methanol and *Acetic acid solution* (15:85)

**Standard solution:** 0.1 mg/mL of USP Aminobenzoic Acid RS in *Mobile phase*. Sonicate to aid dissolution.

**Sample solution:** 0.1 mg/mL of Aminobenzoic Acid in *Mobile phase*. Sonicate to aid dissolution.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.0-mm × 15-cm; 3.5-μm packing L11

**Flow rate:** 0.4 mL/min

**Injection volume:** 5 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing:** NMT 1.5

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of aminobenzoic acid

( $C_7H_7NO_2$ ) in the portion of Aminobenzoic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

## IMPURITIES

• **RESIDUE ON IGNITION (281):** NMT 0.1%

**Delete the following:**

• **HEAVY METALS, Method II (231):** NMT 20 ppm (Official 1-

Jan-2018)

## • ORGANIC IMPURITIES

**Solution A:** Acetonitrile and methanol (70:80)

**Buffer:** 1.5 g/L of monobasic potassium phosphate and 2.5 g/L of octanesulfonic acid sodium salt in water. Adjust with phosphoric acid to a pH of 2.2.

**Mobile phase:** *Solution A* and *Buffer* (20:80)

**Standard stock solution:** 0.25 mg/mL each of USP

Benzocaine RS and 4-nitrobenzoic acid in methanol

**Standard solution:** 0.5 μg/mL each of USP Benzocaine RS and 4-nitrobenzoic acid in *Mobile phase*, from the *Standard stock solution*

**Sample solution:** 0.25 mg/mL of Aminobenzoic Acid in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.0-mm × 15-cm; 5-μm packing L7

**Flow rate:** 1.0 mL/min

**Injection volume:** 20 μL

**Run time:** 11 times the retention time of the aminobenzoic acid peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of 4-nitrobenzoic acid or any unspecified impurity in the portion of Aminobenzoic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of 4-nitrobenzoic acid or any unspecified impurity from the *Sample solution*

$r_S$  = peak response of 4-nitrobenzoic acid from the *Standard solution*

$C_S$  = concentration of 4-nitrobenzoic acid in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminobenzoic Acid in the *Sample solution* (mg/mL)

Calculate the percentage of benzocaine in the portion of Aminobenzoic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of benzocaine from the *Sample solution*  
 $r_S$  = peak response of benzocaine from the *Standard solution*  
 $C_S$  = concentration of USP Benzocaine RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Aminobenzoic Acid in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1. Disregard any impurity peaks less than 0.02%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Aminobenzoic acid	1.0	—
4-Nitrobenzoic acid	4.0	0.2
Benzocaine	9.0	0.2
Any individual unspecified impurity	—	0.1
Total impurities	—	0.5

#### • LIMIT OF ANILINE AND *p*-TOLUIDINE

Diluent: 84 g/L of sodium hydroxide in water

Standard solution: 1.0 µg/mL each of aniline and *p*-toluidine in methylene chloride

Sample solution: Dissolve 1 g of Aminobenzoic Acid in 10.0 mL of Diluent, and extract with two quantities each of 10.0 mL of methylene chloride. Combine, and wash with 5 mL of water. Filter through anhydrous sodium sulfate, and wash the filter with methylene chloride. Evaporate in a water bath at 50°–60° to obtain a volume of about 1–5 mL. Transfer to a 10-mL volumetric flask, and dilute with methylene chloride to volume.

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused silica capillary, coated with a 0.5-µm film of phase G27

Temperatures

Injection port: 280°

Detector: 300°

Column: See Table 2.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
130	0	130	4
130	20	180	5

Carrier gas: Helium

Flow rate: 1.0 mL/min

Injection volume: 2 µL

Split ratio: 1:10

#### Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—The relative retention times for aniline and *p*-toluidine are about 0.8 and 1.0, respectively.]

Calculate, in ppm, the amount of aniline and *p*-toluidine in the portion of Aminobenzoic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 10^6$$

- $r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of the corresponding impurity from the *Standard solution*  
 $C_S$  = concentration of the corresponding impurity in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminobenzoic Acid in the *Sample solution* (mg/mL)

#### Acceptance criteria

Aniline: NMT 10 ppm

*p*-Toluidine: NMT 10 ppm

#### SPECIFIC TESTS

##### • LOSS ON DRYING (731)

Analysis: Dry a sample at 105° for 2 h.

Acceptance criteria: NMT 0.2%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

##### • USP REFERENCE STANDARDS (11)

USP Aminobenzoic Acid RS

USP Benzocaine RS

Benzoic acid, 4-amino-, ethyl ester.

C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub> 165.19

## Aminobenzoic Acid Gel

#### DEFINITION

Aminobenzoic Acid Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of aminobenzoic acid (C<sub>7</sub>H<sub>7</sub>NO<sub>2</sub>).

#### IDENTIFICATION

##### • A. INFRARED ABSORPTION (197K)

##### • B. ULTRAVIOLET ABSORPTION (197U)

Sample solution: 5 µg/mL in alcohol

Acceptance criteria: Meets the requirements

#### ASSAY

##### • PROCEDURE

Mobile phase: Methanol, glacial acetic acid, and water (30:1:69). Allow the mixture to cool, and pass, if necessary, through a suitable microporous membrane filter, and degas.

Internal standard solution: 7 mg/mL of salicylic acid in methanol; dissolve by sonicating.

Standard stock solution: 0.42 mg/mL of USP Aminobenzoic Acid RS in methanol; dissolve by sonicating.

Standard solution: 0.042 mg/mL of USP Aminobenzoic Acid RS in methanol prepared as follows. Transfer 5 mL each of *Standard stock solution* and *Internal standard solution* into a 50-mL volumetric flask, and dilute with methanol to volume. Pass through 0.6-µm filter paper. Throughout the preparation, protect against actinic light.

Sample solution: Nominally 0.042 mg/mL of aminobenzoic acid in methanol prepared as follows. Transfer a quantity of Gel, equivalent to 4.2 mg of aminobenzoic acid, into a 100-mL volumetric flask. Add 10.0 mL of *Internal standard solution* and 50 mL of methanol. Shake or sonicate, as necessary, and dilute with methanol to volume. Filter, if necessary, through filter paper (Whatman No. 41 or equivalent). Pass through 0.6-µm filter paper. Throughout this preparation, protect against actinic light.

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L11

Flow rate: 1.0 mL/min

Injection volume: 15 µL

#### System suitability

Sample: *Standard solution*

Chromatograph replicate 15-µL injections of the *Standard solution* until the response ratio variability is within 1.0% of average.

[NOTE—The relative retention times for aminobenzoic acid and salicylic acid are about 1.0 and 3.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between aminobenzoic acid and salicylic acid peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aminobenzoic acid ( $C_7H_7NO_2$ ) in the portion of Gel taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of aminobenzoic to salicylic acid from the *Sample solution*

$R_S$  = peak response ratio of aminobenzoic to salicylic acid from the *Standard solution*

$C_S$  = concentration of USP Aminobenzoic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aminobenzoic acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method II (611):** 42.3%–54.0% (w/w) of  $C_2H_5OH$

#### PERFORMANCE TESTS

- **MINIMUM FILL (755):** Meets the requirements

#### SPECIFIC TESTS

- **PH (791):** 4.0–6.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**  
USP Aminobenzoic Acid RS

### Aminobenzoic Acid Topical Solution

#### DEFINITION

Aminobenzoic Acid Topical Solution contains, in each mL, NLT 45 mg and NMT 55 mg of aminobenzoic acid ( $C_7H_7NO_2$ ).

#### IDENTIFICATION

##### A.

**Sample:** 1 mL of Topical Solution

**Analysis:** To the *Sample* add 1 mL of 1 N sodium hydroxide, and add, in order, 0.5 mL of potassium iodide TS, 0.5 mL of 3 N hydrochloric acid, and 0.5 mL of sodium hypochlorite TS.

**Acceptance criteria:** A brown precipitate is formed.

##### B.

**Sample:** 1 mL of Topical Solution

**Analysis:** To the *Sample* add 2 mL of 3 N hydrochloric acid, and cool to 10°. Add 1 mL of a 10-mg/mL sodium nitrite solution, then add a solution prepared by mixing 50 mg of 2-naphthol with 3 mL of a 100-mg/mL sodium hydroxide solution.

**Acceptance criteria:** A red color is produced.

#### ASSAY

##### PROCEDURE

**Sample:** 5 mL of Topical Solution

**Analysis:** Transfer the *Sample* to a suitable open vessel, evaporate on a steam bath to dryness, and proceed as directed in *Nitrite Titration* (451). Each mL of 0.1 M sodium nitrite is equivalent to 13.71 mg of aminobenzoic acid ( $C_7H_7NO_2$ ).

**Acceptance criteria:** 45–55 mg/mL

#### OTHER COMPONENTS

- **ALCOHOL DETERMINATION (611):** 65%–75%

#### SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.895–0.905

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

### Aminocaproic Acid

$C_6H_{13}NO_2$

Hexanoic acid, 6-amino-

6-Aminohexanoic acid [60-32-2].

131.17

#### DEFINITION

Aminocaproic Acid contains NLT 98.5% and NMT 101.5% of aminocaproic acid ( $C_6H_{13}NO_2$ ), calculated on the anhydrous basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

#### ASSAY

##### PROCEDURE

**Solution A:** 0.55 g/L of sodium 1-heptanesulfonate in water

**Mobile phase:** Dissolve 10 g of monobasic potassium phosphate in 300 mL of *Solution A*, and add 250 mL of methanol, followed by another 300 mL of *Solution A*. Adjust the mixture with phosphoric acid to a pH of 2.2, and dilute with *Solution A* to 1 L.

**Internal standard solution:** 1.25 mg/mL of methionine in water

**Standard stock solution:** 12.5 mg/mL of USP Aminocaproic Acid RS in water

**Standard solution:** 5.0 mL of *Standard stock solution* and 2.0 mL of *Internal standard solution* in a 100-mL volumetric flask. Dilute with water to volume.

**Sample stock solution:** 12.5 mg/mL of Aminocaproic Acid in water

**Sample solution:** 5.0 mL of *Sample stock solution* and 2.0 mL of *Internal standard solution* in a 100-mL volumetric flask. Dilute with water to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Column temperature:** 30°

**Flow rate:** 0.7 mL/min

**Run time:** NLT 2 times the retention time of aminocaproic acid

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for aminocaproic acid and methionine are about 0.76 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between aminocaproic acid and methionine

Relative standard deviation: NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of aminocaproic acid ( $C_6H_{13}NO_2$ ) in the portion of Aminocaproic Acid taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of aminocaproic acid to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of aminocaproic acid to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Aminocaproic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminocaproic Acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.5%–101.5% on the anhydrous basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

#### Delete the following:

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm (Official 1-Jan-2018)

#### SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 0.5%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Aminocaproic Acid RS

### Aminocaproic Acid Injection

#### DEFINITION

Aminocaproic Acid Injection is a sterile solution of Aminocaproic Acid in Water for Injection. It contains NLT 95.0% and NMT 107.5% of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ).

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

**Sample:** Mix 2 mL of Injection, added dropwise, with 100 mL of acetone, rapidly stirring the mixture with a glass rod to induce crystallization. Allow the mixture to stand for 15 min, and pass through a sintered-glass filter of medium pore size. Wash the crystals with 25 mL of acetone, apply a vacuum to remove the solvent, dry at 105° for 30 min, and cool. Use the residue.

**Acceptance criteria:** Meets the requirements

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Transfer 11 g of sodium 1-pentanesulfonate and 40 g of anhydrous sodium sulfate to a 2-L volumetric flask, and dissolve in about 500 mL of water. Add 20 mL of 1 N sulfuric acid and 30 mL of acetonitrile, and dilute with water to volume.

**Standard solution:** 2.5 mg/mL of USP Aminocaproic Acid RS in *Mobile phase*

**System suitability solution:** Mix 20 µL of benzyl alcohol with 100 mL of water. Dilute 1.0 mL of this solution with *Standard solution* to 10 mL.

**Sample stock solution:** Nominally equivalent to 25 mg/mL of aminocaproic acid from a suitable volume of Injection in water

**Sample solution:** 2.5 mg/mL of *Sample stock solution* in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4-mm × 30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 50 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 7.0 between benzyl alcohol and aminocaproic acid, *System suitability solution*

[NOTE—The aminocaproic acid peak elutes before the benzyl alcohol peak.]

**Relative standard deviation:** NMT 1.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of aminocaproic acid ( $C_6H_{13}NO_2$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Aminocaproic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aminocaproic acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–107.5%

#### SPECIFIC TESTS

- **PH** (791): 6.0–7.6
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.05 USP Endotoxin Unit/mg of aminocaproic acid
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS** (11)  
USP Aminocaproic Acid RS  
USP Endotoxin RS

### Aminocaproic Acid Oral Solution

#### DEFINITION

Aminocaproic Acid Oral Solution contains NLT 95.0% and NMT 115.0% of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ).

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

**Sample:** Mix 1 g of ion-exchange resin (strongly acidic styrene-divinylbenzene cation-exchange resin) with 10 mL of 1 N hydrochloric acid in a 100-mL beaker. Decant and discard the hydrochloric acid, and wash the resin with five 10-mL portions of water, decanting and discarding the liquid following each washing. Place the washed resin in a 125-mL glass-stoppered, conical flask, and add a volume of Oral Solution, nominally equivalent to 250 mg of aminocaproic acid, and 10 mL of water. Insert the stopper in the flask, and shake by mechanical means for 30 min. Transfer the resin slurry to a sintered-glass funnel of medium pore size. Wash with 100 mL of water, filter by applying suction, and discard the washing. Place a beaker under the stem of the funnel, add 10 mL of 1 N hydrochloric acid to the resin,

stir for 4–5 min, and filter by applying suction. Evaporate the filtrate on a steam bath to dryness, dry at 105° for 1 h, and cool.

Acceptance criteria: The residue meets the requirements.

## ASSAY

### PROCEDURE

**Sample solution:** Place an amount nominally equivalent to 250 mg of aminocaproic acid from a volume of Oral Solution in about 80 mL of glacial acetic acid.

#### Titrimetric system

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid in dioxane VS

**Endpoint detection:** Visual

**Analysis:** To the *Sample solution* add 10 drops of a 1-in-500 solution of crystal violet in chlorobenzene. Titrate with *Titrant* to a blue endpoint, and perform a blank determination. Each mL of 0.1 N perchloric acid is equivalent to 13.12 mg of aminocaproic acid ( $C_6H_{13}NO_2$ ).

Acceptance criteria: 95.0%–115.0%

## SPECIFIC TESTS

- PH (791):** 6.0–6.5

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.
- USP REFERENCE STANDARDS (11)**  
USP Aminocaproic Acid RS

## Aminocaproic Acid Tablets

### DEFINITION

Aminocaproic Acid Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ).

### IDENTIFICATION

#### A. INFRARED ABSORPTION (197K)

**Sample:** Triturate 2 Tablets with 10 mL of water, and filter into 100 mL of acetone. Swirl the mixture, and allow to stand for 15 min to complete crystallization. Pass the solution through a sintered-glass filter of medium pore size, and wash the crystals with 25 mL of acetone. Apply vacuum to remove the solvent, dry at 105° for 30 min, and cool. Use the residue.

Acceptance criteria: Meet the requirements

## ASSAY

### PROCEDURE

**Sample solution:** Nominally equivalent to about 500 mg of aminocaproic acid from NLT 20 finely powdered Tablets taken in a beaker in about 100 mL of glacial acetic acid. Heat gently to effect solution, and cool.

#### Titrimetric system

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid in dioxane VS

**Endpoint detection:** Visual

**Analysis:** To the *Sample solution* add 10 drops of a 1-in-500 solution of crystal violet in chlorobenzene. Titrate with *Titrant* to a blue endpoint, and perform a blank determination. Each mL of 0.1 N perchloric acid is equivalent to 13.12 mg of aminocaproic acid ( $C_6H_{13}NO_2$ ).

Acceptance criteria: 95.0%–105.0%

## PERFORMANCE TESTS

### DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Buffer:** Dissolve 6.185 g of boric acid and 7.930 g of potassium chloride in about 1000 mL of water, and add 60 mL of 1.0 N sodium hydroxide. Dilute with water to 2000 mL, and adjust if necessary with 1.0 N sodium hydroxide to a pH of  $9.5 \pm 0.1$ .

**Standard solution:** 0.5 mg/mL of USP Aminocaproic Acid RS in water

**Sample solution:** Filter a portion of the solution under test.

**Blank:** Water

**Analysis:** Into three separate 50-mL volumetric flasks pipet 1 mL each of *Sample solution*, *Standard solution*, and *Blank*. Add 20.0 mL of *Buffer* and 3.0 mL of a freshly prepared 1-in-500 solution of  $\beta$ -naphthoquinone-4-sodium sulfonate to each flask. Swirl to mix, and place the three flasks in a water bath maintained at a temperature of  $65 \pm 5^\circ$  for 45 min. Cool, and dilute the contents of each flask with water to volume. Determine the percentage of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ) dissolved from absorbances, at the wavelength of maximum absorbance at about 460 nm, from the *Sample solution* in comparison with those from the *Standard solution*, using the *Blank* to set the instrument.

**Tolerances:** NLT 75% (Q) of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ) is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.
- USP REFERENCE STANDARDS (11)**  
USP Aminocaproic Acid RS

## Aminoglutethimide

$C_{13}H_{16}N_2O_2$  232.28  
2,6-Piperidinedione, 3-(4-aminophenyl)-3-ethyl-;  
2-(p-Aminophenyl)-2-ethylglutarimide [125-84-8].

### DEFINITION

Aminoglutethimide contains NLT 98.0% and NMT 102.0% of aminoglutethimide ( $C_{13}H_{16}N_2O_2$ ), calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION (197M)**
- B. ULTRAVIOLET ABSORPTION (197U)**  
**Analytical wavelength:** 242 nm  
**Medium:** Methanol  
**Sample solution:** 10  $\mu$ g/mL  
**Acceptance criteria:** Absorptivities, calculated on a dried basis, differ by NMT 2.0%.

## ASSAY

### PROCEDURE

**Buffer:** Add 120 mL of 0.1 N acetic acid to 100 mL of 0.1 N potassium hydroxide in a 1000-mL volumetric flask, and add 250 mL of water. Adjust by the addition

of either 1 N acetic acid or 1 N potassium hydroxide to a pH of  $5.0 \pm 0.1$ . Dilute with water to volume.

**Mobile phase:** Methanol and Buffer (27:73)

**Diluent:** Methanol and Buffer (1:1)

**Standard solution:** 0.5 mg/mL of USP Aminoglutethimide RS in Diluent

**Sample solution:** 0.5 mg/mL of Aminoglutethimide in Diluent. Pass through a filter of 0.45- $\mu$ m or finer pore size filter, discarding the first 5 mL of the filtrate.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 3.9-mm  $\times$  15-cm; 4- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.3 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Tailing factor:** NMT 1.7

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of aminoglutethimide ( $C_{13}H_{16}N_2O_2$ ) in the portion of Aminoglutethimide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the Sample solution

$r_S$  = peak area from the Standard solution

$C_S$  = concentration of USP Aminoglutethimide RS in the Standard solution (mg/mL)

$C_U$  = concentration of Aminoglutethimide in the Sample solution (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

#### Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 ppm • (Official 1-

Jan-2018)

- **LIMIT OF AZO-AMINOGLUTETHIMIDE**

[NOTE—Use low-actinic glassware. Conduct this test promptly under subdued light. Wear protective gloves resistant to dimethyl sulfoxide to prevent contact with skin. Use shaking, not sonication or heat, to dissolve the USP Azo-aminoglutethimide RS and the Sample.]

**Buffer:** 150 mL of 0.1 N acetic acid and 50 mL of 0.1 N potassium hydroxide, diluted in water to 1000 mL

**Mobile phase:** Dissolve 100 mg of edetate disodium in 350 mL of Buffer. Add 650 mL of methanol, and cool to room temperature. Adjust with glacial acetic acid to a pH of  $5.0 \pm 0.1$ .

**Standard solution:** 0.5  $\mu$ g/mL of USP Azo-aminoglutethimide RS in dimethyl sulfoxide

**Sample solution:** 1 mg/mL of Aminoglutethimide in dimethyl sulfoxide

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 328 nm

**Column:** 3.9-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Tailing factor:** NMT 1.2

**Capacity factor:** 2.0–5.0

**Column efficiency:** NLT 800 theoretical plates

#### Analysis

**Samples:** Standard solution and Sample solution

[NOTE—The aminoglutethimide elutes with the dimethyl sulfoxide.]

Calculate the percentage of azo-aminoglutethimide in the specimen of Aminoglutethimide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Azo-aminoglutethimide RS in the Standard solution ( $\mu$ g/mL)

$C_U$  = concentration of Aminoglutethimide in the Sample solution (mg/mL)

**Acceptance criteria:** NMT 0.03% of 3,3'-(azodi-4,1-phenylene)-3,3'-dimethylbis-[2,6-piperidinedione] (corresponding to azo-aminoglutethimide)

#### • ORGANIC IMPURITIES

**Buffer, Mobile phase, Diluent, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Standard solution:** 10  $\mu$ g/mL of USP *m*-Aminoglutethimide RS in Diluent

**Sample solution:** 1 mg/mL of Aminoglutethimide in Diluent. Pass through a filter of 0.45- $\mu$ m or finer pore size, discarding the first 5 mL of the filtrate.

#### Analysis

**Samples:** Standard solution and Sample solution

[NOTE—The relative retention times for aminoglutethimide and *m*-aminoglutethimide are about 0.8 and 1.0, respectively.]

Calculate the percentage of *m*-aminoglutethimide in the portion of Aminoglutethimide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP *m*-Aminoglutethimide RS in the Standard solution (mg/mL)

$C_U$  = concentration of Aminoglutethimide in the Sample solution (mg/mL)

**Acceptance criteria:** NMT 2.0% of *m*-aminoglutethimide

Calculate the percentage of each peak, other than the main peak and the *m*-aminoglutethimide peak, in the portion of Aminoglutethimide taken, if present:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = response of each peak

$r_T$  = sum of the responses of all the peaks from the Sample solution

**Acceptance criteria:** NMT 1.0% total impurities, other than *m*-aminoglutethimide

#### SPECIFIC TESTS

##### • SULFATE

**Sample solution:** 1 mg/mL in dilute methanol (1 in 20)

**Analysis:** To 100 mL of Sample solution add 1.0 mL of 3 N hydrochloric acid and 2.0 mL of barium chloride TS.

- Acceptance criteria: No turbidity is produced.
- **pH (791)**  
Sample solution: 1 mg/mL in dilute methanol (1 in 20)  
Acceptance criteria: 6.2–7.3
- **Loss on Drying (731)**  
Analysis: Dry at 105° to constant weight.  
Acceptance criteria: NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**  
USP Aminoglutethimide RS  
USP *m*-Aminoglutethimide RS  
USP Azo-aminoglutethimide RS

**Aminoglutethimide Tablets****DEFINITION**

Aminoglutethimide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of aminoglutethimide ( $C_{13}H_{16}N_2O_2$ ).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197M)**  
Sample: Transfer 500 mg of finely powdered Tablets to a suitable container. Add 25 mL of acetone, mix, and filter. Evaporate the filtrate at room temperature to dryness, and dry the residue under vacuum over silica gel for 2 h.  
Acceptance criteria: Meet the requirements

**ASSAY**• **PROCEDURE**

**Buffer:** Add 120 mL of 0.1 N acetic acid to 100 mL of 0.1 N potassium hydroxide in a 1000-mL volumetric flask, and add 250 mL of water. Adjust by the addition of either 1 N acetic acid or 1 N potassium hydroxide to a pH of  $5.0 \pm 0.1$ . Dilute with water to volume.

**Mobile phase:** Methanol and *Buffer* (27:73)

**Diluent:** Methanol and *Buffer* (1:1)

**Standard solution:** 0.5 mg/mL of USP Aminoglutethimide RS in *Diluent*

**Sample solution:** Nominally 0.5 mg/mL of aminoglutethimide in *Diluent* prepared as follows. Transfer an equivalent to 200 mg of aminoglutethimide, from finely powdered Tablets (NLT 20), to a 200-mL volumetric flask. Add 130 mL of *Diluent*, and sonicate for 5 min. Shake by mechanical means for 30 min, and dilute with *Diluent* to volume. Centrifuge this solution, transfer 25.0 mL of the clear supernatant to a 50-mL volumetric flask, and dilute with *Diluent* to volume. Pass through a filter of 0.45- $\mu$ m or finer pore size, discarding the first 5 mL of the filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

## Aminolevulinic Acid Hydrochloride

$C_5H_9NO_3 \cdot HCl$  167.59  
5-Aminolevulinic acid hydrochloride;  
5-Amino-4-oxopentanoic acid hydrochloride [5451-09-2].

### DEFINITION

Aminolevulinic Acid Hydrochloride contains NLT 98.0% and NMT 102.0% of aminolevulinic acid hydrochloride ( $C_5H_9NO_3 \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION**, (197K) or (197A)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL**, *Chloride* (191): Meets the requirements

### ASSAY

#### PROCEDURE

**Solution A:** Water adjusted with 2 M sulfuric acid to a pH of 2.2

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Methanol (%)
0	95	5
2	95	5
6	60	40
8	60	40
9	95	5
23	95	5

**Diluent:** Methanol and *Solution A* (1:3)

**Standard solution:** 4 mg/mL of USP Aminolevulinic Acid Hydrochloride RS in *Diluent*

**Sample solution:** 4 mg/mL of Aminolevulinic Acid Hydrochloride in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 2.1-mm × 10-cm; 1.7-μm packing L1

**Flow rate:** 0.4 mL/min

**Injection volume:** 5 μL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.6

**Relative standard deviation:** NMT 0.73%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of aminolevulinic acid hydrochloride ( $C_5H_9NO_3 \cdot HCl$ ) in the portion of Aminolevulinic Acid Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Aminolevulinic Acid Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminolevulinic Acid Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%

#### ORGANIC IMPURITIES

**Mobile phase, Diluent, and Chromatographic system:**

Proceed as directed in the *Assay*.

**Standard solution:** 0.04 mg/mL each of USP Aminolevulinic Acid Hydrochloride RS, USP Aminolevulinic Acid Related Compound A RS, and USP Aminolevulinic Acid Related Compound B RS in *Diluent*

**Sample solution:** 40 mg/mL of Aminolevulinic Acid Hydrochloride in *Diluent*

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 10%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of aminolevulinic acid related compound A or aminolevulinic acid related compound B in the portion of Aminolevulinic Acid Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of the corresponding USP Reference Standard from the *Standard solution*

$C_S$  = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminolevulinic Acid Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity eluting before aminolevulinic acid related compound A in the portion of Aminolevulinic Acid Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any unspecified impurity eluting before aminolevulinic acid related compound A from the *Sample solution*

$r_S$  = peak response of aminolevulinic acid from the *Standard solution*

$C_S$  = concentration of USP Aminolevulinic Acid Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminolevulinic Acid Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity eluting after aminolevulinic acid related compound A in the portion of Aminolevulinic Acid Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any unspecified impurity eluting after aminolevulinic acid related compound A from the *Sample solution*

$r_S$  = peak response of aminolevulinic acid related compound A from the *Standard solution*

$C_S$  = concentration of USP Aminolevulinic Acid Related Compound A RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminolevulinic Acid Hydrochloride in the Sample solution (mg/mL)

**Acceptance criteria:** See Table 2. Disregard any impurity peak less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Aminolevulinic acid	1.0	—
Aminolevulinic acid related compound A	7.8	0.15
Aminolevulinic acid related compound B	12.0	0.15
Any individual unspecified impurity	—	0.10
Total impurities	—	0.5

### SPECIFIC TESTS

#### • pH (791)

**Sample solution:** 10 mg/mL in carbon dioxide-free water

**Acceptance criteria:** 2.5–2.9

#### • Loss on Drying (731)

**Sample:** 1 g

**Analysis:** Dry the Sample over phosphorous pentoxide under vacuum at 100°–105° for 5 h.

**Acceptance criteria:** NMT 0.5%

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.

#### • USP REFERENCE STANDARDS (11)

USP Aminolevulinic Acid Hydrochloride RS

USP Aminolevulinic Acid Related Compound A RS  
3,3'-(Pyrazine-2,5-diyl)dipropionic acid.

$C_{10}H_{12}N_2O_4$  224.22

USP Aminolevulinic Acid Related Compound B RS

Methyl 5-(1,3-dioxoisindolin-2-yl)-4-oxopentanoate.

$C_{14}H_{13}NO_5$  275.26

## Aminopentamide Sulfate

$C_{19}H_{24}N_2O \cdot H_2SO_4$  394.49

$\alpha$ -[2-(Dimethylamino)propyl]- $\alpha$ -phenylbenzeneacetamide sulfate [60-46-8].

» Aminopentamide Sulfate contains not less than 95.0 percent and not more than 103.0 percent of  $C_{19}H_{24}N_2O \cdot H_2SO_4$ .

**Packaging and storage—**Preserve in tight containers, and store at controlled room temperature.

**Labeling—**Label it to indicate that it is for veterinary use only.

#### USP Reference standards (11)—

USP Aminopentamide Sulfate RS

**Clarity and color of solution—**Dissolve 0.5 g in 10 mL of water; the solution is clear and colorless.

### Identification—

**A: Infrared Absorption (197K).**

**B:** It meets the requirements of the tests for Sulfate (191).

**Melting range (741):** between 179° and 186°.

**pH (791):** between 1.2 and 3.0, in a solution (2.5 in 100).

**Loss on drying (731)—**Dry it at 105° for 4 hours; it loses not more than 4.4% of its weight.

**Residue on ignition (281):** not more than 0.5%.

**Assay—**Dissolve about 500 mg of Aminopentamide Sulfate, accurately weighed, in 100 mL of dimethylformamide in a suitable container. Add 5 drops of thymol blue TS, and titrate with 0.1 N lithium methoxide VS in toluene to a deep blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N lithium methoxide is equivalent to 19.72 mg of  $C_{19}H_{24}N_2O \cdot H_2SO_4$ .

## Aminopentamide Sulfate Injection

» Aminopentamide Sulfate Injection is a sterile solution of Aminopentamide Sulfate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ).

**Packaging and storage—**Preserve in tight, single-dose or multiple-dose Containers for Injections, as described in Packaging and Storage Requirements (659), Injection Packaging. Store at controlled room temperature.

**Labeling—**Label Injection to indicate that it is for veterinary use only.

#### USP Reference standards (11)—

USP Aminopentamide Sulfate RS

USP Endotoxin RS

**Identification—**Transfer 10 mL of the Injection to a separator, add sodium hydroxide TS until alkaline to litmus, and extract with 25 mL of chloroform. Transfer a few drops of the chloroform extract to a KRS-5 plate, and allow to dry. Record the IR absorption spectrum by the attenuated total reflectance technique (see Mid-Infrared Spectroscopy (854)). The spectrum thus obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Aminopentamide Sulfate RS, concomitantly measured.

**Bacterial Endotoxins Test (85)—**It contains not more than 25 USP Endotoxin Units per mg of aminopentamide sulfate.

**Sterility Tests (71)—**It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.

**pH (791):** between 2.5 and 4.5.

**Other requirements—**It meets the requirements under Injections and Implanted Drug Products (1).

### Assay—

**Mobile phase—**Transfer 14.4 g of sodium lauryl sulfate to a 500-mL volumetric flask, add 100 mL of glacial acetic acid, dilute with water to volume, mix, and pass through a filter having a 0.5- $\mu$ m or finer porosity. Transfer 50 mL of this solution to a 1000-mL volumetric flask, add 350 mL of methanol and 350 mL of acetonitrile, dilute with water to volume, and mix. Filter and degas before use. Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Standard preparation—**Quantitatively dissolve an accurately weighed quantity of USP Aminopentamide Sulfate RS in water to obtain a solution having a known concentration

equivalent to the labeled concentration of aminopentamide sulfate in the Injection.

**Assay preparation**—Use the undiluted Injection.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ) in each mL of the Injection taken by the formula:

$$C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Aminopentamide Sulfate RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the aminopentamide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminopentamide Sulfate Tablets

» Aminopentamide Sulfate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label Tablets to indicate that they are for veterinary use only.

**USP Reference standards** (11)—  
USP Aminopentamide Sulfate RS

**Identification**—Transfer a portion of ground Tablet powder, equivalent to about 2 mg of aminopentamide, to a separator, add 20 mL of water and 3 mL of 10 N sodium hydroxide, and mix. Extract with two 20-mL portions of methylene chloride, and evaporate the combined methylene chloride extracts to a volume of about 0.5 mL. Transfer a few drops of the chloroform concentrate to a KRS-5 plate, and allow to dry. Record the IR absorption spectrum by the attenuated total reflectance technique (see *Mid-Infrared Spectroscopy* (854)). The spectrum thus obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Aminopentamide Sulfate RS, concomitantly measured.

**Disintegration** (701): not more than 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—Dry about 1 g of powdered Tablets, accurately weighed, in vacuum at a pressure of 5 mm of mercury or less at 60° for 3 hours: it loses not more than 4.0% of its weight.

**Assay**—

**Mobile phase**—Transfer 14.4 g of sodium lauryl sulfate to a 500-mL volumetric flask, add 100 mL of glacial acetic acid, dilute with water to volume, mix, and pass through a filter having a 0.5-µm or finer porosity. Transfer 50 mL of this solution to a 1000-mL volumetric flask, add 350 mL of

methanol and 350 mL of acetonitrile, dilute with water to volume, and mix. Filter and degas before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Aminopentamide Sulfate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.02 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.2 mg of aminopentamide, to a suitable flask. Add 10.0 mL of *Mobile phase*, sonicate for 5 minutes, and stir by mechanical means for about 10 minutes. Pass this mixture through a filter having a 0.5-µm or finer porosity, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1, and is maintained at a constant temperature of about 40°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 900 theoretical plates; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ) in the portion of Tablets taken by the formula:

$$10C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Aminopentamide Sulfate RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the aminopentamide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminophylline

$C_{16}H_{24}N_{10}O_4$  420.43

$C_{16}H_{24}N_{10}O_4 \cdot 2H_2O$  456.46

1*H*-Purine-2,6-dione, 3,7-dihydro-1,3-dimethyl-, compd.

with 1,2-ethanediamine (2:1);

Theophylline compound with ethylenediamine (2:1).

Anhydrous [317-34-0].

Dihydrate [5897-66-5].

### DEFINITION

Aminophylline is anhydrous or contains NMT two molecules of water of hydration. It contains NLT 84.0% and NMT 87.4% of anhydrous theophylline ( $C_7H_8N_4O_2$ ), calculated on the anhydrous basis.

### IDENTIFICATION

## Aminophylline Injection

### DEFINITION

Aminophylline Injection is a sterile solution of Aminophylline in Water for Injection, or is a sterile solution of Theophylline in Water for Injection prepared with the aid of Ethylenediamine. It contains, in each mL, an amount of aminophylline ( $C_{16}H_{24}N_{10}O_4$ ) equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ).

Aminophylline Injection may contain an excess of Ethylenediamine, but no other substance may be added for the purpose of pH adjustment.

[NOTE—Do not use the Injection if crystals have separated.]

## IDENTIFICATION

### A.

**Analysis:** Dilute a volume of Injection equivalent to 500 mg of aminophylline with water to 20 mL, and add, with constant stirring, 1 mL of 3 N hydrochloric acid or enough to completely precipitate the theophylline, and filter. To the filtrate add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline. Shake by mechanical means for 10 min, add 5 mL of 3 N hydrochloric acid to acidify, chill, collect the precipitated disulfonamide of ethylenediamine, wash with water, recrystallize from water, and dry at 105° for 1 h.

**Acceptance criteria:** The precipitate melts at 164°–171°.

## Aminophylline Oral Solution

#### DEFINITION

Aminophylline Oral Solution is an aqueous solution of Aminophylline, prepared with the aid of Ethylenediamine. It contains an amount of aminophylline (C<sub>16</sub>H<sub>24</sub>N<sub>10</sub>O<sub>4</sub>) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>).

Aminophylline Oral Solution may contain an excess of ethylenediamine, but no other substance may be added for the purpose of pH adjustment.

#### IDENTIFICATION

##### Change to read:

#### A. ▲INFRARED ABSORPTION (197K)▲USP40

**Analysis:** Transfer a volume of Oral Solution equivalent to 500 mg of aminophylline to a suitable container and add, with constant stirring, 1 mL of 3 N hydrochloric acid or enough to completely precipitate the theophylline. Filter (retain the filtrate), wash the precipitate with small portions of cold water until free from chloride, and dry at 105° for 1 h.

**Acceptance criteria:** ▲The IR spectrum of theophylline so obtained matches that of USP Theophylline RS.▲USP40

#### B.

**Analysis:** To the filtrate obtained in Identification A add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline. Shake by mechanical means for 10 min, add 5 mL of 3 N hydrochloric acid to acidify, chill, collect the precipitated disulfonamide of ethylenediamine, wash with water, recrystallize from water, and dry at 105° for 1 h.

**Acceptance criteria:** The dried precipitate melts at 164°–171°.

## ASSAY

## Change to read:

## • PROCEDURE

**▲Solution A:** 10 mM ammonium acetate prepared as follows. Transfer an appropriate amount of ammonium acetate to a volumetric flask and dissolve in water (about 80% of the flask volume). Adjust with glacial acetic acid to a pH of 5.5 and dilute with water to volume. Pass through a suitable filter of 0.2-μm pore size.

**Solution B:** Methanol

**Mobile phase:** See Table 1.

## Aminophylline Rectal Solution

### DEFINITION

Aminophylline Rectal Solution is an aqueous solution of Aminophylline, prepared with the aid of Ethylenediamine. It contains an amount of aminophylline equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ).

Rectal Solution may contain an excess of ethylenediamine, but no other substance may be added for the purpose of pH adjustment.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Sample:** Dilute an amount of Rectal Solution, equivalent to 500 mg of aminophylline, with water to 20 mL. Add, with constant stirring, 1 mL of 3 N hydrochloric

acid or enough to precipitate the theophylline completely, and filter (save the filtrate). Wash the precipitate with a small portion of cold water until free from chloride, and dry at 105° for 4 h.

**Acceptance criteria:** The dried precipitate meets the requirements.

#### • B.

**Analysis:** To the filtrate obtained in *Identification* test A add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline, shake by mechanical means for 10 min, and add 5 mL of 3 N hydrochloric acid to acidify. Chill, collect the precipitated disulfonamide of ethylenediamine, and wash with water. Recrystallize the washed precipitate from water, and dry at 105° for 1 h.

**Acceptance criteria:** The dried precipitate melts at 164°–171°.

### ASSAY

#### • PROCEDURE

**Standard solution:** 8 µg/mL of USP Theophylline RS in dilute hydrochloric acid (1:100)

**Sample solution:** Pipet a volume of Rectal Solution equivalent to 500 mg of aminophylline into a 500-mL volumetric flask, and dilute with water to volume. Pipet 5 mL of this solution to a second 500-mL volumetric flask, add 50-mL of dilute hydrochloric acid (1:10), and dilute with water to volume.

#### Instrumental conditions

**Mode:** UV

**Analytical wavelength:** About 270 nm

**Cell:** 1 cm

**Blank:** Dilute hydrochloric acid (1:100)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ) in the portion of Rectal Solution taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Theophylline RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of theophylline in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

### OTHER COMPONENTS

#### • CONTENT OF ETHYLENEDIAMINE

**Sample solution:** Measure a volume of Rectal Solution, equivalent to 500 mg of aminophylline, and dilute with water if necessary to make 30 mL.

#### Titrimetric system

**Mode:** Direct titration

**Titrant:** 0.1 N hydrochloric acid VS

**Endpoint detection:** Visual

**Analysis:** Add methyl orange TS to the *Sample solution*, and titrate. Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of ethylene diamine ( $C_2H_8N_2$ ).

**Acceptance criteria:** 218–267 mg of ethylenediamine ( $C_2H_8N_2$ ) per g of theophylline ( $C_7H_8N_4O_2$ ) found in the Assay

### SPECIFIC TESTS

- **pH (791):** 9.0–9.5

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, single-dose or multiple-dose containers at controlled room temperature.
- **LABELING:** Label the Rectal Solution to state the content of anhydrous theophylline.

• **USP REFERENCE STANDARDS (11)**

USP Theophylline RS

## Aminophylline Suppositories

### DEFINITION

Aminophylline Suppositories contain an amount of aminophylline equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ).

### IDENTIFICATION

- **A.**  
**Analysis:** Evaporate on a steam bath a portion of *Sample stock solution* from the *Assay*, equivalent to 500 mg of aminophylline, to about one-half its volume. Adjust with 1 N sodium hydroxide to a pH of 7.0, chill, and filter the crystals of theophylline. Retain the filtrate, free from washings. Wash the crystals of theophylline with small portions of ice-cold water, and dry at 105° for 1 h.  
**Acceptance criteria:** The recrystallized theophylline melts at 270°–274°.
- **B.**  
**Analysis:** Transfer 10 mg of the dried precipitate from *Identification test A* to a porcelain dish, and add 1 mL of hydrochloric acid and 100 mg of potassium chlorate. Evaporate on a steam bath to dryness, and invert the dish over a vessel containing a few drops of 6 N ammonium hydroxide.  
**Acceptance criteria:** The residue acquires a purple color, which is destroyed by solutions of fixed alkalis.
- **C.**  
**Analysis:** To the filtrate obtained in *Identification test A* add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline, shake by mechanical means for 10 min, and add 5 mL of 3 N hydrochloric acid to acidify. Chill, collect the precipitated disulfonamide of ethylenediamine, and wash with water. Recrystallize the washed precipitate from water, and dry at 105° for 1 h.  
**Acceptance criteria:** The dried precipitate melts at 164°–171°.

### ASSAY

#### • PROCEDURE

**Sample stock solution:** Transfer NLT 5 Suppositories to a tared small dish and a glass rod, and heat on a steam bath until the suppositories are melted. Mix the melt by stirring it with the rod, and cool while stirring. Transfer a portion of the cooled melt, equivalent to 1 g of aminophylline, into a beaker, add 60 mL of hot water and 3 mL of nitric acid, and heat on a steam bath for 15 min with frequent stirring. Cool, transfer to a separator with the aid of 40 mL of ether, shake well, and allow to separate, using a few mL of alcohol if necessary to bring about separation of any emulsion that has formed. Draw the water layer into a 100-mL volumetric flask; wash the ether with two 15-mL portions of water, adding the washings to the volumetric flask; and dilute with water to volume.

**Sample solution:** Transfer a portion of the *Sample stock solution*, equivalent to 250 mg of aminophylline, to a 250-mL conical flask. Add 10 mL of 6 N ammonium hydroxide and 20 mL of 0.1 N silver nitrate VS, and heat on a steam bath for 15 min. Cool to between 5° and 10° for 20 min; filter, preferably through a filtering crucible of fine porosity under reduced pressure; and wash the precipitate with small portions of water until the last washing gives NMT a faint opalescence with hydro-

chloric acid. Dissolve the precipitate by pouring over it small volumes of warm 2 N nitric acid, collecting the solution in a conical flask. Wash the filtering crucible a few times with warm water acidified with nitric acid, receiving the washings in the same flask. Cool, and add 2 mL of ferric ammonium sulfate TS.

**Analysis:** Titrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N ammonium thiocyanate is equivalent to 18.02 mg of theophylline ( $C_7H_8N_4O_2$ ).

**Acceptance criteria:** 90.0%–110.0%

### OTHER COMPONENTS

#### • CONTENT OF ETHYLENEDIAMINE

**Sample solution:** Weigh a portion of the stirred, congealed mass of the Suppositories from the *Assay*, equivalent to 500 mg of aminophylline, and place in a 500-mL conical flask. Add 150 mL of a mixture of equal volumes of alcohol and ether, and warm gently under reflux for 30 min, with occasional swirling. Cool to room temperature.

#### Titrimetric system

**Mode:** Direct titration

**Titrant:** 0.1 N hydrochloric acid VS

**Endpoint detection:** Potentiometric

**Analysis:** Titrate the *Sample solution* using a glass-modified calomel electrode system (replace the saturated potassium chloride solution of the calomel electrode with methanol saturated with lithium chloride). Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of ethylenediamine ( $C_2H_8N_2$ ).

**Acceptance criteria:** 152–190 mg of ethylenediamine ( $C_2H_8N_2$ ) per g of theophylline ( $C_7H_8N_4O_2$ ) found in the *Assay*

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, in a cold place.
- **LABELING:** Label the Suppositories to state the content of anhydrous theophylline.

## Aminophylline Tablets

### DEFINITION

Aminophylline Tablets contain an amount of aminophylline equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ).

[NOTE—The ammoniacal odor present in the vapor space above the Tablets is often quite strong, especially when bottles having suitably tight closures are newly opened. This is due to ethylenediamine vapor pressure build-up, a natural condition in the case of aminophylline.]

### IDENTIFICATION

**Analysis**Samples: *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

 $A_U$  = absorbance of the *Sample solution* $A_S$  = absorbance of the *Standard solution* $C_S$  = concentration of USP Theophylline RS in the *Standard solution* ( $\mu\text{g/mL}$ ) $C_U$  = nominal concentration of theophylline in the *Sample solution* ( $\text{mg/mL}$ )

Acceptance criteria: Meet the requirements

**IMPURITIES****Add the following:****▲ ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, Impurity stock solution, System suitability solution, and Chromatographic system: Proceed as directed in the Assay.

**Standard solution:** 2.0  $\mu\text{g/mL}$  each of USP Theophylline RS and USP Theophylline Related Compound D RS in water**Sample solution:** Nominally 1.0  $\text{mg/mL}$  of anhydrous aminophylline from NLT 20 finely powdered Tablets in water prepared as follows. Transfer 10  $\text{mg}$  of anhydrous aminophylline from a portion of the powder to a 10-mL volumetric flask. Add 5 mL of water and sonicate for 30 min. Dilute with water to volume. Pass through a suitable filter of 0.22- $\mu\text{m}$  pore size, discarding the first 2–3 mL.**System suitability**Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for relative retention times.]

**Suitability requirements****Resolution:** NLT 2.0 between theophylline and theophylline related compound F, *System suitability solution***Relative standard deviation:** NMT 3.0% for each peak, *Standard solution***Analysis**Samples: *Standard solution* and *Sample solution*

Calculate the percentage of theophylline related compound D in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of theophylline related compound D from the *Sample solution* $r_S$  = peak response of theophylline related compound D from the *Standard solution* $C_S$  = concentration of USP Theophylline Related Compound D RS in the *Standard solution* ( $\text{mg/mL}$ ) $C_U$  = nominal concentration of aminophylline in the *Sample solution* ( $\text{mg/mL}$ )

Calculate the percentage of any other individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of any other individual unspecified degradation product from the *Sample solution* $r_S$  = peak response of theophylline from the *Standard solution* $C_S$  = concentration of USP Theophylline RS in the *Standard solution* ( $\text{mg/mL}$ ) $C_U$  = nominal concentration of aminophylline in the *Sample solution* ( $\text{mg/mL}$ )

Acceptance criteria: See Table 2. Disregard peaks less than 0.05%.

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

**ADDITIONAL REQUIREMENTS****Change to read:**

- **PACKAGING AND STORAGE:** Preserve in tight containers.  
▲Store at controlled room temperature.▲USP40
- **LABELING:** Label the Tablets to state the content of anhydrous theophylline.

**Change to read:**• **USP REFERENCE STANDARDS (11)**

USP Theophylline RS

▲USP Theophylline Related Compound D RS

N-Methyl-5-(methylamino)-1H-imidazole-4-carboxamide.

 $C_6H_{10}N_4O$  154.17

USP Theophylline Related Compound F RS

7-(2-Hydroxyethyl)-1,3-dimethyl-3,7-dihydro-1H-purine-2,6-dione.

 $C_9H_{12}N_4O_3$  224.22▲USP40**Aminophylline Delayed-Release Tablets****DEFINITION**Aminophylline Delayed-Release Tablets contain an amount of aminophylline equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ).

[NOTE—The ammoniacal odor present in the vapor space above Tablets is often quite strong, especially when bottles having suitably tight closures are newly opened. This is due to ethylenediamine vapor pressure build-up, a natural condition in the case of aminophylline.]

**IDENTIFICATION**

- **A.**  
**Analysis:** Macerate a quantity of Tablets, equivalent to 500 mg of aminophylline, with 25 mL of water, and filter: the filtrate is alkaline to litmus. To the filtrate add 1 mL of 3 N hydrochloric acid, stir, and if necessary, chill to precipitate the theophylline. Filter, and retain the filtrate, free from washings. Wash the theophylline crystals so obtained with small quantities of ice-cold water, and dry at 105° for 1 h. Transfer 10 mg of the dried theophylline crystals to a porcelain dish, add 1 mL of hydrochloric acid and 100 mg of potassium chlorate, evaporate on a steam bath to dryness, and invert the dish over a vessel containing a few drops of 6 N ammonium hydroxide.  
**Acceptance criteria:** The residue acquires a purple color, which is destroyed by solutions of fixed alkalis.
- **B.**  
**Analysis:** Recrystallize the dried theophylline crystals from *Identification* test A from water, and dry at 105° for 1 h.  
**Acceptance criteria:** The recrystallized theophylline melts at 270°–274°.
- **C.**  
**Analysis:** To the filtrate obtained in *Identification* test A add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline, shake by mechanical means for 10 min, and add 5 mL of 3 N hydrochloric acid to acidify. Chill, collect the precipitated disulfonamide of ethylenediamine, and wash with water. Recrystallize the washed precipitate from water, and dry at 105° for 1 h.  
**Acceptance criteria:** The dried precipitate melts at 164°–171°.

**ASSAY**• **PROCEDURE**

**Sample solution:** Transfer an equivalent to 2 g of aminophylline, from powdered Tablets (NLT 20), to a 200-mL volumetric flask with the aid of a mixture of 50 mL of water and 15 mL of 6 N ammonium hydroxide, and allow to stand for 30 min with frequent shaking, warming to 50° if necessary to dissolve the aminophylline. Cool the mixture to room temperature if it has been warmed, and add water to volume. Centrifuge 50 mL of the mixture; pipet a portion of the clear supernatant, equivalent to 250 mg of aminophylline, into a 250-mL conical flask; and dilute with water if necessary to make 40 mL. Add 8 mL of 6 N ammonium hydroxide and 20.0 mL of 0.1 N silver nitrate VS, mix, heat to boiling, and continue boiling for 15 min. Cool to between 5° and 10° for 20 min, then filter, preferably through a filtering crucible under reduced pressure, and wash the precipitate with three 10-mL portions of water. Acidify the combined filtrate and washings with nitric acid, and add an additional 3 mL of the acid. Cool, and add 2 mL of ferric ammonium sulfate TS.

**Titrimetric system**

**Mode:** Residual titration

**Titrant:** 0.1 N ammonium thiocyanate VS

**Endpoint detection:** Visual

**Analysis:** Titrate the excess silver nitrate with *Titrant*. Each mL of 0.1 N silver nitrate is equivalent to 18.02 mg of theophylline ( $C_7H_8N_4O_2$ ).

**Acceptance criteria:** 93.0%–107.0%

**OTHER COMPONENTS**• **CONTENT OF ETHYLENEDIAMINE**

**Sample solution:** Transfer a portion, equivalent to 350 mg of aminophylline, of the powdered Tablets prepared in the Assay into a 100-mL conical flask. Add 20 mL of water, and digest at 50°, with frequent shaking, for 30 min. Cool, filter into a 250-mL conical flask, and wash with water until the last washing is neutral to litmus. Use the combined filtrate and washings.

**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.1 N hydrochloric acid VS

**Endpoint detection:** Visual

**Analysis:** Add methyl orange TS to the *Sample solution*, and titrate. Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of ethylenediamine ( $C_2H_8N_2$ ).

**Acceptance criteria:** 140–190 mg of ethylenediamine ( $C_2H_8N_2$ ) per g of theophylline ( $C_7H_8N_4O_2$ ) found in the Assay

**PERFORMANCE TESTS**

- **DISINTEGRATION (701):** 30 min, determined as directed in *Delayed-Release (Enteric-Coated) Tablets*

- **UNIFORMITY OF DOSAGE UNITS (905)**

**Procedure for content uniformity**

**Standard solution:** 10 µg/mL of USP Theophylline RS

**Sample solution:** Place 1 Tablet in a 250-mL volumetric flask, add 200 mL of water, and shake by mechanical means until disintegration is complete. Add water to volume. Filter a portion of the mixture, discarding the first 20 mL of the filtrate.

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** About 269 nm

**Cell:** 1 cm

**Blank:** Water

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of theophylline ( $C_7H_8N_4O_2$ ) in each Tablet:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Theophylline RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of theophylline in the *Sample solution* (µg/mL)

**Acceptance criteria:** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label the Tablets to state the content of anhydrous theophylline.
- **USP REFERENCE STANDARDS (11)**  
 USP Theophylline RS

**Aminosaliclylate Sodium**

$C_7H_6NNaO_3 \cdot 2H_2O$	211.15
$C_7H_6NNaO_3$	175.12
Benzoic acid, 4-amino-2-hydroxy-, monosodium salt, dihydrate;	
Monosodium 4-aminosalicylate dihydrate [6018-19-5].	
Anhydrous [133-10-8].	

**DEFINITION**

Aminosaliclylate Sodium contains NLT 98.0% and NMT 101.0% of aminosaliclylate sodium ( $C_7H_6NNaO_3$ ), calculated on the anhydrous basis.

**[CAUTION]**—Prepare solutions of Aminosaliclylate Sodium within 24 h of administration. Under no circumstances use a solution if its color is darker than that of a freshly prepared solution.]

**IDENTIFICATION**• **A.**

**Sample stock solution:** Dissolve 250 mg in 3 mL of 1 N sodium hydroxide, transfer to a 500-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer a 5-mL aliquot of the *Sample stock solution* to a 250-mL volumetric flask containing 12.5 mL of pH 7 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*), and dilute with water to volume.

**Analysis:** Compare the *Sample solution* in a suitable spectrometer against a blank of the same buffer in the same concentration.

**Acceptance criteria:** The *Sample solution* exhibits absorbance maxima at  $265 \pm 2$  and  $299 \pm 2$  nm, and the ratio  $A_{265}/A_{299}$  is 1.50–1.56.

• **B.**

**Sample:** 1 g

**Analysis:** Place the *Sample* into a small, round-bottom flask, and add 10 mL of acetic anhydride. Heat the flask on a steam bath for 30 min, add 40 mL of water, filter, cool, and allow to stand until the diacetyl derivative has crystallized. Collect the precipitate on a filter, wash well with water, and dry at  $105^\circ$  for 1 h.

**Acceptance criteria:** The diacetyl derivative melts at  $191^\circ$ – $197^\circ$ .

• **C.**

**Sample:** 50 mg

**Analysis:** Dissolve the *Sample* in 5 mL of water, add 1 mL of 3 N hydrochloric acid, and filter if necessary. To the filtrate add 1 drop of ferric chloride TS.

**Acceptance criteria:** A violet color is produced.

• **D. IDENTIFICATIONS TESTS—GENERAL, Sodium (191):** Meets the requirements

**ASSAY**

• **PROCEDURE**

**Solution A:** 12.7 mg/mL of tetrabutylammonium hydroxide in methanol

**Mobile phase:** *Solution A*, 0.05 M dibasic sodium phosphate, and 0.05 M monobasic sodium phosphate (150:425:425)

**Internal standard solution:** 5 mg/mL of acetaminophen in *Mobile phase*

**Standard solution:** 0.5 mg/mL of aminosaliclylic acid prepared as follows. Transfer 12.5 mg of USP Aminosaliclylic Acid RS to a 25-mL low-actinic volumetric flask, add 15 mL of *Mobile phase*, and swirl to dissolve. Add 2.5 mL of *Internal standard solution*, and dilute with *Mobile phase* to volume.

**Sample solution:** 0.69 mg/mL of Aminosaliclylate Sodium prepared as follows. Transfer 69 mg of Aminosaliclylic Acid to a 100-mL low-actinic volumetric flask, add 50 mL of *Mobile phase*, and swirl to dissolve. Add 10.0 mL of *Internal standard solution*, and dilute with *Mobile phase* to volume.

**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen and aminosaliclylic acid are 0.83 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.7 between aminosaliclylic acid and acetaminophen

**Relative standard deviation:** NMT 1.0% for the peak response ratio of aminosaliclylic acid to acetaminophen

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

After use, wash the column for 30 min with methanol, water, and phosphoric acid (77: 23: 0.6), and then wash for 30 min with methanol and water (50:50).

Calculate the percentage of aminosaliclylate sodium ( $C_7H_6NNaO_3$ ) in the sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$R_U$  = peak response ratio of aminosaliclylate to acetaminophen from the *Sample solution*

$R_S$  = peak response ratio of aminosaliclylic acid to acetaminophen from the *Standard solution*

$C_S$  = concentration of USP Aminosaliclylic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminosaliclylate Sodium in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of anhydrous aminosaliclylate sodium, 175.12

$M_{r2}$  = molecular weight of aminosaliclylic acid, 153.14

**Acceptance criteria:** 98.0%–101.0% on the anhydrous basis

**IMPURITIES**

• **CHLORIDE AND SULFATE, Chloride (221)**

**Sample solution:** 25 mg/mL in a mixture of 5 mL of nitric acid and 15 mL of water

**Acceptance criteria:** NMT 0.042%; the solution shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid.

**Delete the following:**

• **HEAVY METALS, Method II (231):** NMT 30 ppm (Official 1: Jan-2018)

• **LIMIT OF *m*-AMINOPHENOL**

**Solution A:** 12.7 mg/mL of tetrabutylammonium hydroxide in methanol

**Mobile phase:** *Solution A*, 0.05 M dibasic sodium phosphate, and 0.05 M monobasic sodium phosphate (150:425:425)

**Internal standard solution:** 5  $\mu$ g/mL of sulfanilamide in *Mobile phase*

**Standard stock solution:** 12  $\mu$ g/mL of USP *m*-Aminophenol RS in *Mobile phase*

**Standard solution:** 1.2  $\mu$ g/mL of USP *m*-Aminophenol RS prepared as follows. Transfer 10.0 mL of the *Standard stock solution* and 10.0 mL of the *Internal standard solution* to a 100-mL low-actinic volumetric flask, and dilute with *Mobile phase* to volume.

**Sample solution:** Use the *Sample solution* prepared as directed in the Assay, except use 10.0 mL of sulfanilamide as the *Internal standard solution*.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm  $\times$  25-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for sulfanilamide and *m*-aminophenol are 0.66 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.5 between *m*-aminophenol and sulfanilamide

**Relative standard deviation:** NMT 7%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

After use, wash the column for 30 min with methanol, water, and phosphoric acid (77: 23: 0.6), and then wash for 30 min with methanol and water (50:50).

Calculate the percentage of *m*-aminophenol in the portion of Aminosaliclylate Sodium taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = peak response ratio of *m*-aminophenol to sulfanilamide from the *Sample solution*  
 $R_S$  = peak response ratio of *m*-aminophenol to sulfanilamide from the *Standard solution*  
 $C_S$  = concentration of USP *m*-Aminophenol RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of the *Sample solution* (mg/mL), as determined in the *Assay*  
 Acceptance criteria: NMT 0.25%

### SPECIFIC TESTS

#### • PH (791)

Sample solution: 20 mg/mL  
 Acceptance criteria: 6.5–8.5

#### • WATER DETERMINATION, Method I (921): 16.0%–18.0%

#### • HYDROGEN SULFIDE, SULFUR DIOXIDE, AND AMYL ALCOHOL

Sample: 500 mg

Analysis: Dissolve the *Sample* in 5 mL of 1 N sodium hydroxide, add 6 mL of 3 N hydrochloric acid, and stir vigorously.

Acceptance criteria: No odor of hydrogen sulfide or sulfur dioxide is perceptible, and NMT a faint odor of amyl alcohol is perceptible. A piece of moistened lead acetate test paper held over the mixture does not become discolored.

#### • CLARITY AND COLOR OF SOLUTION

Sample 1: 1 g

Analysis 1: Dissolve *Sample 1* in 10 mL of water.

Acceptance criteria 1: The resulting solution is clear and has NMT a faint yellow color.

Sample 2: 1 g

Analysis 2: Dissolve *Sample 2* in 50 mL of a freshly prepared mixture of 5 mL of nitric acid and 45 mL of water.

Acceptance criteria 2: The resulting solution is clear and has NMT a slight color.

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in tight, light-resistant containers, protected from excessive heat.

#### • USP REFERENCE STANDARDS (11)

USP *m*-Aminophenol RS  
 USP Aminosaliclylic Acid RS

## Aminosaliclylate Sodium Tablets

### DEFINITION

Aminosaliclylate Sodium Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of aminosaliclylate sodium ( $C_7H_6NNaO_3 \cdot 2H_2O$ ).

### IDENTIFICATION

**Sample:** Mix powdered Tablets, equivalent to 3 g of aminosaliclylate sodium, with 40 mL of water, and filter. Add to the filtrate 15 mL of 1 N acetic acid, and allow to stand until precipitation has occurred. Collect the precipitate on a filter, wash well with water, and dry at 105° for 30 min.

#### • A.

Sample: 1 g

Analysis: Place the *Sample* in a small, round-bottom flask, and add 10 mL of acetic anhydride. Heat the flask on a steam bath for 30 min, add 40 mL of water, filter, cool, and allow to stand until the diacetyl derivative has crystallized. Collect the precipitate on a filter, wash well with water, and dry at 105° for 1 h.

Acceptance criteria: The diacetyl derivative melts at 191°–197°.

#### • B.

Sample: 0.1 g

Analysis: Shake the *Sample* with 10 mL of water, and filter. To 5 mL of the filtrate add 1 drop of ferric chloride TS.

Acceptance criteria: A violet color is produced.

### ASSAY

#### • PROCEDURE

**Solution A:** 12.7 mg/mL of tetrabutylammonium hydroxide in methanol

**Mobile phase:** *Solution A*, 0.05 M dibasic sodium phosphate, and 0.05 M monobasic sodium phosphate (150:425:425)

**Internal standard solution:** 5 mg/mL of acetaminophen in *Mobile phase*

**Standard solution:** 0.5 mg/mL of aminosaliclylic acid prepared as follows. Transfer 12.5 mg of USP Aminosaliclylic Acid RS to a 25-mL low-actinic volumetric flask, add 15 mL of *Mobile phase*, and swirl to dissolve. Add 2.5 mL of *Internal standard solution*, and dilute with *Mobile phase* to volume.

**Sample stock solution:** 6.9 mg/mL of aminosaliclylate sodium in *Mobile phase* prepared as follows. Add nominally 690 mg of aminosaliclylate sodium from NLT 20 powdered Tablets to a 100-mL low-actinic volumetric flask. Add 50 mL of *Mobile phase*, and shake for 5 min. Dilute with *Mobile phase* to volume, and filter.

**Sample solution:** 0.69 mg/mL of aminosaliclylate from the *Sample stock solution* prepared as follows. Transfer 10.0 mL of the clear filtrate to a 100-mL low-actinic volumetric flask containing 10.0 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen and aminosaliclylic acid are 0.83 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.7 between aminosaliclylic acid and acetaminophen

**Relative standard deviation:** NMT 1.0% for the peak response ratio of aminosaliclylic acid to acetaminophen

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

After use, wash the column for 30 min with a mixture of methanol, water, and phosphoric acid (77: 23: 0.6), and then wash for 30 min with a mixture of methanol and water (50:50).

Calculate the percentage of the labeled amount of aminosaliclylate sodium ( $C_7H_6NNaO_3 \cdot 2H_2O$ ) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$R_U$  = peak response ratio of aminosaliclylate to acetaminophen from the *Sample solution*

$R_S$  = peak response ratio of aminosaliclylic acid to acetaminophen from the *Standard solution*

$C_S$  = concentration of USP Aminosaliclylic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aminosaliclylate sodium in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of aminosaliclylate sodium dihydrate, 211.15

$M_{r2}$  = molecular weight of aminosaliclylic acid, 153.14

Acceptance criteria: 95.0%–105.0%

## PERFORMANCE TESTS

- **DISSOLUTION**, *Procedure for a Pooled Sample* (711)  
Medium: Water; 900 mL  
Apparatus 1: 100 rpm  
Time: 45 min  
Analysis: Determine the percentage of the labeled amount of aminosaliclylate sodium ( $C_7H_6NNaO_3 \cdot 2H_2O$ ) dissolved, using the procedure as directed in the *Assay*, making any necessary modifications.  
Tolerances: NLT 75% (Q) of the labeled amount of aminosaliclylate sodium ( $C_7H_6NNaO_3 \cdot 2H_2O$ ) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

## IMPURITIES

### LIMIT OF *m*-AMINOPHENOL

- Solution A:** 12.7 mg/mL of tetrabutylammonium hydroxide in methanol
- Mobile phase:** *Solution A*, 0.05 M dibasic sodium phosphate, and 0.05 M monobasic sodium phosphate (150:425:425)

- $C_S$  = concentration of USP *m*-Aminophenol RS in the *Standard solution* (mg/mL)
- $C_U$  = nominal concentration of aminosaliclylate sodium in the *Sample solution*, as determined in the *Assay* (mg/mL)

Acceptance criteria: NMT 1.0%

## USP REFERENCE STANDARDS (11)

- USP *m*-Aminophenol RS
- USP Aminosaliclylic Acid RS

## Aminosaliclylic Acid

$C_7H_7NO_3$  153.14  
Benzoic acid, 4-amino-2-hydroxy-;  
4-Aminosaliclylic acid [65-49-6].

## DEFINITION

Aminosaliclylic Acid contains NLT 98.5% and NMT 100.5% of aminosaliclylic acid ( $C_7H_7NO_3$ ), calculated on the anhydrous basis.

[CAUTION—Under no circumstances use a solution prepared from Aminosaliclylic Acid if its color is darker than that of a freshly prepared solution.]

## IDENTIFICATION

- **A.**  
**Sample stock solution:** Dissolve 250 mg in 3 mL of 1 N sodium hydroxide, transfer to a 500-mL volumetric flask, and dilute with water to volume.  
**Sample solution:** Transfer a 5-mL aliquot of the *Sample stock solution* to a 250-mL volumetric flask containing 12.5 mL of pH 7 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*), and dilute with water to volume.  
**Analysis:** Compare the *Sample solution* in a suitable spectrometer against a blank of the same buffer in the same concentration.  
**Acceptance criteria:** The *Sample solution* exhibits absorbance maxima at  $265 \pm 2$  and  $299 \pm 2$  nm, and the ratio  $A_{265}/A_{299}$  is 1.50–1.56.
- **B.**  
**Sample:** 1 g  
**Analysis:** Place the *Sample* in a small, round-bottom flask, and add 10 mL of acetic anhydride. Heat the flask on a steam bath for 30 min, add 40 mL of water, filter, cool, and allow to stand until the diacetyl derivative has crystallized. Collect the precipitate on a filter, wash well with water, and dry at  $105^\circ$  for 1 h.  
**Acceptance criteria:** The diacetyl derivative melts at  $191^\circ$ – $197^\circ$ .
- **C.**  
**Sample:** 0.1 g  
**Analysis:** Shake the *Sample* with 10 mL of water, and filter. To 5 mL of the filtrate add 1 drop of ferric chloride TS.  
**Acceptance criteria:** A violet color is produced.

## ASSAY

### PROCEDURE

- Solution A:** 12.7 mg/mL of tetrabutylammonium hydroxide in methanol
- Mobile phase:** *Solution A*, 0.05 M dibasic sodium phosphate, and 0.05 M monobasic sodium phosphate (150:425:425)
- Internal standard solution:** 5 mg/mL of acetaminophen in *Mobile phase*
- Standard solution:** 0.5 mg/mL of aminosaliclylic acid prepared as follows. Transfer 12.5 mg of USP Aminosaliclylic Acid RS to a 25-mL low-actinic volumetric flask, add 15 mL of *Mobile phase*, and swirl to dissolve. Add 2.5 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.

**Sample solution:** 0.5 mg/mL of Aminosalicyclic Acid prepared as follows. Transfer 12.5 mg of Aminosalicyclic Acid to a 25-mL low-actinic volumetric flask, add 15 mL of *Mobile phase*, and swirl to dissolve. Add 2.5 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen and aminosalicyclic acid are 0.83 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.7 between aminosalicyclic acid and acetaminophen

**Relative standard deviation:** NMT 1.0% for the peak response ratio of aminosalicyclic acid to acetaminophen

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

After use, wash the column for 30 min with a mixture of methanol, water, and phosphoric acid (77: 23: 0.6), and then wash for 30 min with a mixture of methanol and water (50:50).

Calculate the percentage of aminosalicyclic acid ( $C_7H_7NO_3$ ) in the portion of Aminosalicyclic Acid taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of aminosalicyclic acid to acetaminophen from the *Sample solution*

$R_S$  = peak response ratio of aminosalicyclic acid to acetaminophen from the *Standard solution*

$C_S$  = concentration of USP Aminosalicyclic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminosalicyclic Acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.5%–100.5% on the anhydrous basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%

#### Delete the following:

- **HEAVY METALS**, *Method II* (231): NMT 30 ppm • (Official 1-Jan-2018)
- **CHLORIDE AND SULFATE**, *Chloride* (221)  
**Sample solution:** 25 mg/mL in a mixture of nitric acid and water (5:15)  
**Acceptance criteria:** NMT 0.042%; the solution shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid.
- **LIMIT OF *m*-AMINOPHENOL**  
**Solution A:** 12.7 mg/mL of tetrabutylammonium hydroxide in methanol  
**Mobile phase:** *Solution A*, 0.05 M dibasic sodium phosphate, and 0.05 M monobasic sodium phosphate (150:425:425)  
**Internal standard solution:** 5 µg/mL of sulfanilamide in *Mobile phase*  
**Standard stock solution:** 12 µg/mL of USP *m*-Aminophenol RS in *Mobile phase*  
**Standard solution:** 1.2 µg/mL of USP *m*-Aminophenol RS prepared as follows. Transfer 10.0 mL of the *Standard stock solution* and 10.0 mL of the *Internal standard solution* to a 100-mL low-actinic volumetric flask, and dilute with *Mobile phase* to volume.

**Sample solution:** 0.5 mg/mL of Aminosalicyclic Acid prepared as follows. Transfer 50 mg of Aminosalicyclic Acid to a 100-mL low-actinic volumetric flask, add 50 mL of *Mobile phase*, and swirl to dissolve. Add 10.0 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm × 25-cm; 10-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for sulfanilamide and *m*-aminophenol are about 0.66 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between *m*-aminophenol and sulfanilamide

**Relative standard deviation:** NMT 7%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

After use, wash the column for 30 min with a mixture of methanol, water, and phosphoric acid (77: 23: 0.6), and then wash for 30 min with a mixture of methanol and water (50:50).

Calculate the percentage of *m*-aminophenol in the portion of Aminosalicyclic Acid taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of *m*-aminophenol to sulfanilamide from the *Sample solution*

$R_S$  = peak response ratio of *m*-aminophenol to sulfanilamide from the *Standard solution*

$C_S$  = concentration of USP *m*-Aminophenol RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution*, as determined in the *Assay* (mg/mL)

**Acceptance criteria:** NMT 0.25%

#### SPECIFIC TESTS

- **pH** (791): 3.0–3.7, in a saturated solution
- **WATER DETERMINATION**, *Method I* (921): NMT 0.5%
- **HYDROGEN SULFIDE, SULFUR DIOXIDE, AND AMYL ALCOHOL**  
**Sample:** 500 mg  
**Analysis:** Dissolve the *Sample* in 5 mL of 1 N sodium hydroxide, add 6 mL of 3 N hydrochloric acid, and stir vigorously.

**Acceptance criteria:** No odor of hydrogen sulfide or sulfur dioxide is perceptible, and NMT a faint odor of amyl alcohol is perceptible. A piece of moistened lead acetate test paper held over the mixture does not become discolored.

#### CLARITY AND COLOR OF SOLUTION

**Sample 1:** 1 g

**Analysis 1:** Dissolve *Sample 1* in 10 mL of sodium bicarbonate solution (1 in 15).

**Acceptance criteria 1:** The resulting solution is clear and has NMT a faint yellow color.

**Sample 2:** 1 g

**Analysis 2:** Dissolve *Sample 2* in 50 mL of freshly prepared 1.6 M nitric acid.

**Acceptance criteria 2:** The resulting solution is clear and has NMT a slight color.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at a temperature not exceeding 30°.

• **USP REFERENCE STANDARDS (11)**

USP *m*-Aminophenol RS

USP Aminosalicyclic Acid RS

## Aminosalicyclic Acid Tablets

### DEFINITION

Aminosalicyclic Acid Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of aminosalicyclic acid ( $C_7H_7NO_3$ ).

### IDENTIFICATION

**Sample:** Mix powdered Tablets, equivalent to 2 g of aminosalicyclic acid, with 50 mL of a mixture of acetone and chloroform (1:2), and filter. Evaporate the filtrate with a current of warm air to dryness.

• **A.**

**Sample:** 1 g

**Analysis:** Place the *Sample* in a small, round-bottom flask, and add 10 mL of acetic anhydride. Heat the flask on a steam bath for 30 min, add 40 mL of water, filter, cool, and allow to stand until the diacetyl derivative has crystallized. Collect the precipitate on a filter, wash well with water, and dry at 105° for 1 h.

**Acceptance criteria:** The diacetyl derivative melts at 191°–197°.

• **B.**

**Sample:** 0.1 g

**Analysis:** Shake the *Sample* with 10 mL of water, and filter. To 5 mL of the filtrate add 1 drop of ferric chloride TS.

**Acceptance criteria:** A violet color is produced.

### ASSAY

• **PROCEDURE**

**Solution A:** 12.7 mg/mL of tetrabutylammonium hydroxide in methanol

**Mobile phase:** *Solution A*, 0.05 M dibasic sodium phosphate, and 0.05 M monobasic sodium phosphate (150:425:425)

**Internal standard solution:** 5 mg/mL of acetaminophen in *Mobile phase*

**Standard solution:** 0.5 mg/mL of aminosalicyclic acid prepared as follows. Transfer 12.5 mg of USP Aminosalicyclic Acid RS to a 25-mL low-actinic volumetric flask, add 15 mL of *Mobile phase*, and swirl to dissolve. Add 2.5 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.

**Sample stock solution:** Add nominally 500 mg of aminosalicyclic acid from NLT 20 powdered Tablets to a 100-mL low-actinic volumetric flask. Add 50 mL of *Mobile phase*, and shake for 5 min. Dilute with *Mobile phase* to volume, and filter.

**Sample solution:** Transfer 10.0 mL of the clear filtrate from the *Sample stock solution* to a 100-mL low-actinic volumetric flask containing 10.0 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen and aminosalicyclic acid are 0.83 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.7 between aminosalicyclic acid and acetaminophen

**Relative standard deviation:** NMT 1.0% for the peak response ratio of aminosalicyclic acid to acetaminophen

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

After use, wash the column for 30 min with a mixture of methanol, water, and phosphoric acid (77: 23: 0.6), and then wash for 30 min with a mixture of methanol and water (50:50).

Calculate the percentage of the labeled amount of aminosalicyclic acid ( $C_7H_7NO_3$ ) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of aminosalicyclic acid to acetaminophen from the *Sample solution*

$R_S$  = peak response ratio of aminosalicyclic acid to acetaminophen from the *Standard solution*

$C_S$  = concentration of USP Aminosalicyclic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aminosalicyclic acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–105.0%

### PERFORMANCE TESTS

• **DISSOLUTION (711)**

**Medium:** pH 7.5 phosphate buffer; 900 mL (see *Reagents, Indicators, and Solutions—Buffer Solutions*)

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Analysis:** Calculate the percentage of the labeled amount of aminosalicyclic acid ( $C_7H_7NO_3$ ) dissolved, using the procedure as directed in the *Assay*, making any necessary modifications.

**Tolerances:** NLT 75% (Q) of the labeled amount of aminosalicyclic acid ( $C_7H_7NO_3$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

### IMPURITIES

• **LIMIT OF *m*-AMINOPHENOL**

**Mobile phase:** Prepare as directed in the *Assay*.

**Internal standard solution:** 5 µg/mL of sulfanilamide in *Mobile phase*

**Standard stock solution:** 12 µg/mL of USP *m*-Aminophenol RS in *Mobile phase*

**Standard solution:** *Standard stock solution*, *Internal standard solution*, and *Mobile phase* (1:1:8) in a low-actinic volumetric flask

**Sample solution:** Use the *Sample solution* prepared as directed in the *Assay*, except use 10.0 mL of sulfanilamide for the *Internal standard solution*.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm × 25-cm; 10-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for sulfanilamide and *m*-aminophenol are 0.66 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between *m*-aminophenol and sulfanilamide

**Relative standard deviation:** NMT 7%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

After use, wash the column for 30 min with a mixture of methanol, water, and phosphoric acid (77: 23: 0.6), and then wash for 30 min with a mixture of methanol and water (50:50).

Calculate the percentage of *m*-aminophenol in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = peak response ratio of *m*-aminophenol to sulfanilamide from the *Sample solution*  
 $R_S$  = peak response ratio of *m*-aminophenol to sulfanilamide from the *Standard solution*  
 $C_S$  = concentration of USP *m*-Aminophenol RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of aminosalicic acid in the *Sample solution*, as determined in the Assay (mg/mL)

Acceptance criteria: NMT 1.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at a temperature not exceeding 30°.
- **USP REFERENCE STANDARDS** (11)  
 USP *m*-Aminophenol RS  
 USP Aminosalicic Acid RS

## Amiodarone Hydrochloride

$C_{25}H_{29}I_2NO_3 \cdot HCl$  681.77  
 Methanone, (2-butyl-3-benzofuranyl)[4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl]- hydrochloride; 2-Butyl-3-benzofuranyl 4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl ketone hydrochloride [19774-82-4]. 2-Butyl-3-benzofuranyl 4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl ketone [1951-25-3].

#### DEFINITION

Amiodarone Hydrochloride contains NLT 98.5% and NMT 101.0% of  $C_{25}H_{29}I_2NO_3 \cdot HCl$ , calculated on the dried basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

#### ASSAY

##### • PROCEDURE

**Buffer:** Dissolve 6.80 g of monobasic potassium phosphate in 900 mL of water, and add 1.0 mL of triethylamine. Adjust with phosphoric acid to a pH of  $6.00 \pm 0.05$ , and dilute with water to 1000 mL.

**Diluent:** Acetonitrile and water (1:1)

**Mobile phase:** Acetonitrile and Buffer (1:1)

**Standard stock solution:** 0.5 mg/mL of USP Amiodarone Hydrochloride RS in methanol

**Standard solution:** 0.1 mg/mL USP Amiodarone Hydrochloride RS in Diluent from Standard stock solution

**Sample stock solution:** 0.5 mg/mL of Amiodarone Hydrochloride in methanol

**Sample solution:** 0.1 mg/mL of Amiodarone Hydrochloride in Diluent from Sample stock solution

##### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 3.9-mm  $\times$  15-cm; 5- $\mu$ m packing L26

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

##### System suitability

**Sample:** Standard solution

##### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 1.0%

##### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of  $C_{25}H_{29}I_2NO_3 \cdot HCl$  in the portion of Amiodarone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of amiodarone in the *Sample solution*  
 $r_S$  = peak response of amiodarone in the *Standard solution*  
 $C_S$  = concentration of USP Amiodarone Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of Amiodarone Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–101.0%, on the dried basis

#### IMPURITIES

##### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1% on a 1-g sample

#### Delete the following:

##### • HEAVY METALS

**Buffer:** Dissolve 25.0 g of ammonium acetate in 25 mL of water, and add 38.0 mL of 70% hydrochloric acid. Adjust, if necessary, with diluted hydrochloric acid or diluted ammonia solution to a pH of 3.5. Dilute with water to 100.0 mL.

**Lead standard stock solution (1000 ppm Pb):** 1.6 mg/mL of lead nitrate in water

**Lead standard solution:** 10 ppm of lead in water from Lead standard stock solution. [NOTE—Prepare immediately before use.]

**Phenolphthalein solution:** Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL.

**Thioacetamide solution:** Prepare a solution of 40 g/L of thioacetamide in water. To 0.2 mL of the freshly prepared solution, add 1 mL of a mixture of 85% glycerol, 1 M sodium hydroxide, and water (4:3:1). Heat in a water bath for 20 s.

**Sample solution:** Place about 1 g of Amiodarone Hydrochloride in a silica crucible along with 4 mL of magnesium sulfate solution (250 g/L of diluted sulfuric acid). Mix using a fine glass rod, and heat cautiously. If the mixture is a liquid, evaporate gently to dryness on a water bath. Progressively heat to ignition, and continue heating until an almost white or a mostly grayish residue is obtained. Carry out the ignition at a temperature not exceeding 800°. Allow to cool. Moisten the residue with a few drops of dilute sulfuric acid. Evaporate, ignite again, and allow to cool. The total period of ignition must not exceed 2 h. Dissolve the residue in two portions, 5 mL each, of 20% hydrochloric acid. Add 0.1 mL of Phenolphthalein solution followed by 25% ammonia water until a pink color is obtained. Cool, add glacial acetic acid until the solution is decolorized, and add 0.5 mL in excess. Filter if necessary, wash the filter, and dilute with water to 20 mL.

**Standard solution:** Proceed as directed for *Sample solution*, using 2 mL of *Lead standard solution* instead of Amiodarone Hydrochloride. To 10 mL of the solution obtained, add 2 mL of the *Sample solution*.

**Monitor solution:** Proceed as directed for *Sample solution*, adding 2 mL of *Standard solution* to 1 g of Amiodarone Hydrochloride.

**Blank solution:** 10 mL of water and 2 mL of *Sample solution*.

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, *Blank solution*, and *Monitor solution*.

To 12 mL each of the *Standard solution*, *Sample solution*, *Blank solution*, and *Monitor solution* add 2 mL of *Buffer solution*, and mix. Add 1.2 mL of *Thioacetamide solution*, and immediately mix again. Examine the solutions after 2 min. The test is invalid if the *Standard solution* does not show a slight brown color compared to the *Blank solution* or if the *Monitor solution* is not comparable with the *Standard solution*.

**Acceptance criteria:** Any brown color in the *Sample solution* is not more intense than that in the *Standard solution* (20 ppm). [NOTE—If the result is difficult to judge, pass the solutions through a membrane filter having a porosity of 3 µm. Carry out the filtration slowly and uniformly, applying moderate and constant pressure. Compare the spots on the filters obtained from the different solutions.] (Official 1-Jan-2018)

#### Organic Impurities

[NOTE—The product meets the requirements for both *Procedure 1* and *Procedure 2*.]

##### • PROCEDURE 1

**Potassium iodobismuthate solution:** Dissolve 100 g of tartaric acid in 400 mL of water, and add 8.5 g of bismuth subnitrate. Shake for 1 h, add 200 mL of a 400 g/L solution of potassium iodide, and shake well. Allow to stand for 24 h, filter, and protect from light.

**Standard solution A:** 0.02 mg/mL of USP Amiodarone Related Compound H RS in methylene chloride

**Standard solution B:** *Standard solution A* and *Sample solution* (1:1).

**Sample solution:** 100 mg/mL of Amiodarone Hydrochloride in methylene chloride

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** Suitable layer of chromatographic silica gel and fluorescent indicator with maximum absorbance at 254 nm

#### Application volume

**Standard solution A:** 50 µL

**Standard solution B:** 100 µL

**Sample solution:** 50 µL

**Developing solvent system:** Methylene chloride, methanol, and anhydrous formic acid (17:2:1)

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the plate in the *Developing solvent system* until the solvent front has moved NLT two-thirds the length of the plate, and dry in a current of cold air. Spray the plate with *Potassium iodobismuthate solution* and then with 3% hydrogen peroxide solution. Examine immediately in daylight: the spot from *Standard solution B* due to amiodarone related compound H is clearly visible.

**Acceptance criteria:** Any spot with the same  $R_f$  as the spot due to amiodarone related compound H from the *Sample solution* is not more intense than the spot from *Standard solution A* (0.02%).

##### • PROCEDURE 2

**Buffer:** Add 3 mL of glacial acetic acid to 800 mL of water. Adjust with diluted ammonia solution to a pH of 4.9, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile: methanol: *Buffer* (4:3:3 v/v/v).

**Diluent:** Acetonitrile and water (1:1)

**Standard stock solution:** Dissolve equal quantities of USP Amiodarone Related Compound D RS, USP Amiodarone Related Compound E RS, and USP Amiodarone Hydrochloride RS in a known amount of methanol.

**Standard solution:** 0.01 mg/mL each of USP Amiodarone Related Compound D RS, USP Amiodarone Related Compound E RS, and USP Amiodarone Hydrochloride RS, in *Diluent* from *Standard stock solution*

**Sample solution:** 5 mg/mL of Amiodarone Hydrochloride in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**Run time:** 2 times the retention time of amiodarone

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.5 between amiodarone related compound D and amiodarone related compound E

#### Analysis

[NOTE—Disregard any peak that is less than 0.05%.]

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Amiodarone Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response of each impurity in the *Sample solution*

$r_s$  = peak response of amiodarone in the *Standard solution*

$C_s$  = concentration of USP Amiodarone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of Amiodarone Hydrochloride in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.5%

Impurity Table 1

**Solution A:** Add 1.50 g of Amiodarone Hydrochloride to 40 mL of water at 80°, and shake until completely dissolved. Cool, and dilute with water to 50.0 mL.

**Standard solution:** To 15.0 mL of *Solution A* add 1.0 mL of 0.1 M hydrochloric acid, 1.0 mL of an 88.2 mg/L solution of potassium iodide, and 1.0 mL of 0.05 M potassium iodate. Dilute with water to 20.0 mL. Allow to stand protected from light for 4 h.

**Sample solution:** To 15.0 mL of *Solution A* add 1.0 mL of 0.1 M hydrochloric acid and 1.0 mL of 0.05 M potassium iodate. Dilute with water to 20.0 mL. Allow to stand protected from light for 4 h.

**Analysis:** Measure the absorbances of the *Standard solution* and the *Sample solution* at 420 nm, using a mixture of 15.0 mL of *Solution A* and 1.0 mL of 0.1 M hydrochloric acid diluted with water to 20.0 mL to serve as the blank. The absorbance of the *Sample solution* is NMT half the absorbance of the *Standard solution*.

**Acceptance criteria:** NMT 150 ppm

• **PH (791):** 3.2–3.8. Dissolve 1 g of Amiodarone Hydrochloride in water by heating at 80°. Cool, and dilute with water to 20 mL.

• **Loss on Drying (731):** Use 1 g of sample, and dry under vacuum (NMT 0.3 kPa) at 50° for 4 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in light-resistant, tight containers. Store at controlled room temperature.

**• USP REFERENCE STANDARDS (11)**

**Amiodarone Hydrochloride Injection****DEFINITION**

Amiodarone Hydrochloride Injection is a sterile solution of Amiodarone Hydrochloride. It contains NLT 90.0% and NMT 110.0% of the labeled amount of amiodarone hydrochloride (C<sub>25</sub>H<sub>29</sub>I<sub>2</sub>NO<sub>3</sub> · HCl). It may contain suitable preservatives.

**IDENTIFICATION**

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Buffer:** 1.36 g/L of monobasic potassium phosphate in water prepared as follows. To 1.36 g of monobasic potassium phosphate in a 1-L volumetric flask add about 900 mL of water and 1 mL of triethylamine. Adjust with phosphoric acid to a pH of 6.0, and dilute to volume.

**Mobile phase:** Acetonitrile and *Buffer* (800:200)

**Diluent:** Acetonitrile and water (60:40)

**Standard solution:** 0.025 mg/mL of USP Amiodarone Hydrochloride RS in *Diluent*

**Sample solution:** Nominally 0.012 mg/mL of amiodarone hydrochloride in *Diluent* from a suitable volume of Injection

**Chromatographic system**

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 10-cm; 5-μm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20 μL

**Run time:** NLT 2 times the retention time of amiodarone

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amiodarone hydrochloride (C<sub>25</sub>H<sub>29</sub>I<sub>2</sub>NO<sub>3</sub> · HCl) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak area of amiodarone from the *Sample solution*

*r<sub>S</sub>* = peak area of amiodarone from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Amiodarone Hydrochloride RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of amiodarone hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**IMPURITIES****• ORGANIC IMPURITIES**

**Buffer:** 3 mL/L of glacial acetic acid in water prepared as follows. To a suitable amount of glacial acetic acid add water to fill 80% of the total volume, adjust with ammonia to a pH of 4.9, and dilute with water to volume.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (400:300:300)

**Diluent:** Acetonitrile, methanol, and water (50:30:20)

**Standard solution A:** 0.001 mg/mL of USP Amiodarone Hydrochloride RS in *Diluent*

**Standard solution B:** 0.03 mg/mL of USP Amiodarone Related Compound D RS and 2 μg/mL of USP Amiodarone Related Compound E RS in *Diluent*

**Sample solution:** Nominally 1 mg/mL of amiodarone hydrochloride in *Diluent* from a suitable volume of Injection

**Chromatographic system**

(See Chromatography (621), System Suitability.)

**Mode:** LC  
**Detector:** UV 240 nm  
**Column:** 4.6-mm × 15-cm; 5-μm packing L1  
**Column temperature:** 30°  
**Flow rate:** 1 mL/min  
**Injection volume:** 10 μL  
**Run time:** NLT 1.5 times the retention time of amiodarone for the *Standard solution*, and NLT 2 times the retention time of amiodarone for the *Sample solution*

**System suitability**

**Sample:** *Standard solution A*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 5.0%

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of amiodarone related compound D or amiodarone related compound E in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of amiodarone related compound D or amiodarone related compound E from the *Sample solution*

$r_S$  = peak area of amiodarone related compound D or amiodarone related compound E from *Standard solution B*

$C_S$  = concentration of USP Amiodarone Related Compound D RS or USP Amiodarone Related Compound E RS in *Standard solution B* (mg/mL)

$C_U$  = nominal concentration of amiodarone hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified degradation product in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of any unspecified degradation product from the *Sample solution*

$r_S$  = peak area of amiodarone from *Standard solution A*

$C_S$  = concentration of USP Amiodarone Hydrochloride RS in *Standard solution A* (mg/mL)

$C_U$  = nominal concentration of amiodarone hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 1.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Amiodarone related compound E <sup>a</sup>	0.39	0.2
Amiodarone related compound D <sup>b</sup>	0.55	3.0
Amiodarone	1.00	—
Any unspecified degradation product	—	0.20
Total impurities	—	3.5

<sup>a</sup> (2-Butylbenzofuran-3-yl)(4-hydroxyphenyl) methanone.

<sup>b</sup> (2-Butylbenzofuran-3-yl)(4-hydroxy-3,5-diiodophenyl) methanone.

**• LIMIT OF IODIDE**

Use freshly prepared solutions in amber glassware.

**Potassium iodate solution:** 10.7 g/L of potassium iodate in water

**Potassium iodide solution:** 88.2 mg/L of potassium iodide in water

**Amiodarone stock solution:** 5 mg/mL of amiodarone hydrochloride in water from Injection prepared by diluting 5.0 mL of Injection in a 50-mL volumetric flask to volume

**Standard solution:** 4.41 μg/mL prepared as follows.

Into a suitable flask pipet 15.0 mL of *Amiodarone stock solution*, 1.0 mL of 0.1 M hydrochloric acid, 1.0 mL of *Potassium iodide solution*, 1.0 mL of *Potassium iodate solution*, and 2.0 mL of water. Mix, and allow to stand for 4 h, protected from light.

**Sample solution:** Into a suitable flask pipet 15.0 mL of *Amiodarone stock solution*, 1.0 mL of 0.1 M hydrochloric acid, 1.0 mL of *Potassium iodate solution*, and 3.0 mL of water. Mix, and allow to stand for 4 h, protected from light.

**Blank:** Into a suitable flask pipet 15.0 mL of *Amiodarone stock solution*, 1.0 mL of 0.1 M hydrochloric acid, and 4.0 mL of water. Mix, and allow to stand for 4 h, protected from light.

**Instrumental conditions**

**Mode:** UV-Vis

**Analytical wavelength:** 420 nm

**Cell:** 1 cm

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Blank*  
 Calculate the amount of iodide, in ppm, in the portion of Injection taken:

$$\text{Result} = (A_U - A_B)/[(A_S - A_B) - (A_U - A_B)] \times (C_S/C_U) \times (M_{r1}/M_{r2})$$

$A_U$  = absorbance of the *Sample solution*

$A_B$  = absorbance of the *Blank*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of potassium iodide in the *Standard solution* (μg/mL)

$C_U$  = concentration of amiodarone hydrochloride in the *Sample solution* (g/mL)

$M_{r1}$  = molecular weight of iodide, 126.90

$M_{r2}$  = molecular weight of potassium iodide, 166.00

**Acceptance criteria:** NMT 250 ppm

**OTHER COMPONENTS****• CONTENT OF BENZYL ALCOHOL** (if present)

**Internal standard solution:** 1 mg/mL of phenol in isopropyl alcohol

**Blank solution:** 0.2 mg/mL of phenol in isopropyl alcohol prepared as follows. Transfer 5 mL of *Internal standard solution* into a 25-mL volumetric flask, and dilute with isopropyl alcohol to volume.

**Standard stock solution:** 1.62 mg/mL of USP Benzyl Alcohol RS in isopropyl alcohol

**Standard solution:** Transfer 5 mL of *Internal standard solution* and 3 mL of *Standard stock solution* into a 25-mL volumetric flask, and dilute with isopropyl alcohol to volume.

**Sample stock solution:** Nominally equivalent to 1.61 mg/mL of benzyl alcohol in isopropyl alcohol prepared as follows. Transfer 2 mL of Injection into a 25-mL volumetric flask, and dilute with isopropyl alcohol to volume.

**Sample solution:** Nominally 0.2 mg/mL of phenol and 0.19 mg/mL of benzyl alcohol in isopropyl alcohol prepared as follows. Transfer 5 mL of *Internal standard solution* and 3 mL of *Sample stock solution* into a 25-mL volumetric flask, and dilute with isopropyl alcohol to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm × 30-m; coated with 1-μm phase G16

**Temperatures**

Injection port: 200°

Detector: 200°

Column: 150°

Carrier gas: Nitrogen

Flow rate: 10 mL/min

Injection volume: 1 µL

Injection type: Split injection with a split ratio, 10:1

**System suitability**Sample: *Standard solution***Suitability requirements**

Relative standard deviation: NMT 2.0% for the peak response ratio of benzyl alcohol to phenol

**Analysis**Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benzyl alcohol in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

 $R_U$  = peak response ratio of benzyl alcohol to phenol from the *Sample solution* $R_S$  = peak response ratio of benzyl alcohol to phenol from the *Standard solution* $C_S$  = concentration of USP Benzyl Alcohol RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of benzyl alcohol in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

**SPECIFIC TESTS**

- **BACTERIAL ENDOTOXINS TEST** (85): NMT 8.33 USP Endotoxin Units/mg of amiodarone hydrochloride
- **STERILITY TESTS** (71): Meets the requirements
- **PH** (791): 3.0–5.0
- **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS**: Meets the requirements in *Injections and Implanted Drug Products* (1)

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE**: Preserve in single-dose or multiple-dose glass containers, protected from light and excessive heat. Store at controlled room temperature.
- **LABELING**: Label it to indicate that it is to be diluted to the appropriate strength with a suitable parenteral vehicle prior to administration. Label it to indicate the type and amount of preservative used. Label it to indicate that it is preservative free, if no preservative is present.

## Amiodarone Hydrochloride Compounded Oral Suspension

**DEFINITION**

Amiodarone Hydrochloride Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of amiodarone hydrochloride ( $C_{25}H_{29}I_2NO_3 \cdot HCl$ ). Prepare Amiodarone Hydrochloride Compounded Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Amiodarone Hydrochloride tablets*	600 mg of amiodarone hydrochloride
Vehicle: a 1:1 mixture of Ora-Sweet <sup>®</sup> (regular or sugar-free) and Ora-Plus, <sup>®</sup> a sufficient quantity to make	120 mL

\* Cordarone 200-mg tablets, Wyeth-Ayerst Laboratories, Philadelphia, PA.

<sup>®</sup> Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Amiodarone Hydrochloride tablets* in a suitable mortar and comminute to a fine powder with a pestle. Adjust the pH of the *Vehicle* to  $6.5 \pm 0.5$  with a sodium bicarbonate 50-mg/mL solution prepared in Purified Water. Add the *Vehicle* in small portions and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make an amiodarone hydrochloride liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume and mix well.

**ASSAY****• PROCEDURE**

Mobile phase: Methanol, water, and 50 mM monobasic ammonium phosphate (0.5:0.5:99)

Standard solution: 2.5 mg/mL of USP Amiodarone Hydrochloride RS in *Mobile phase*Sample solution: Shake thoroughly by hand each bottle of the Oral Suspension. Prepare 2.5 mg/mL of amiodarone hydrochloride from Oral Suspension and *Mobile phase*.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 10-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 µL

**System suitability**Sample: *Standard solution*

[NOTE—The retention time for amiodarone is about 3.6 min.]

**Suitability requirements**

Relative standard deviation: NMT 2.1% for replicate injections

**Analysis**Samples: *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of amiodarone hydrochloride ( $C_{25}H_{29}I_2NO_3 \cdot HCl$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Amiodarone Hydrochloride RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of amiodarone hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

**SPECIFIC TESTS**

- **PH** (791): 5.8–6.8

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE**: Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
- **BEYOND-USE DATE**: NMT 90 days after the date on which it was compounded when stored in a refrigerator; NMT 30 days when stored at controlled room temperature

- **LABELING:** Label it to state that it is to be well shaken before use and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS (11)**  
USP Amiodarone Hydrochloride RS

## Amitraz

$C_{19}H_{23}N_3$  293.41  
Methanimidamide, *N'*-(2,4-dimethylphenyl)-*N*-[[2,4-dimethylphenyl]imino]methyl]-*N*-methyl-;  
*N*-Methyl-*N'*-2,4-xylyl-*N*-(*N*-2,4-xylylformimidoyl)formamidine;  
*N*-Methylbis(2,4-xylyliminomethyl)amine [33089-61-1].

### DEFINITION

Amitraz contains NLT 95.0% and NMT 101.5% of amitraz ( $C_{19}H_{23}N_3$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197):** [NOTE—Methods described under *Infrared Absorption* (197K), (197M), or (197A) may be used.]
- **B.** The retention time of the amitraz peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Internal standard solution:** 0.7% v/v solution of squalane in methyl acetate

**Standard solution:** 5.0 mg/mL of USP Amitraz RS in *Internal standard solution*

**Sample solution:** 5.0 mg/mL of Amitraz in *Internal standard solution*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm × 15-m fused silica; coated with a 1.5-μm layer of liquid phase G9

#### Temperatures

**Detector:** 300°

**Inlet:** 230°

**Column:** 220°

**Carrier gas:** Helium

**Flow rate:** 12 mL/min

**Injection volume:** 1 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The elution order is amitraz followed by squalane.]

#### Suitability requirements

**Resolution:** NLT 3.0 between amitraz and squalane

**Relative standard deviation:** NMT 2.0% from the peak area ratio of amitraz to squalane

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amitraz ( $C_{19}H_{23}N_3$ ) in the portion of Amitraz taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of amitraz and squalane from the *Sample solution*

$R_S$  = peak response ratio of amitraz and squalane from the *Standard solution*

$C_S$  = concentration of USP Amitraz RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amitraz in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–101.5% on the anhydrous basis

### IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.2%

#### ORGANIC IMPURITIES

**Standard solution:** 0.05 mg/mL of 2,4-dimethylaniline, 1.0 mg/mL of USP Amitraz Related Compound A RS, 0.5 mg/mL of USP Amitraz Related Compound B RS, and 1.0 mg/mL of USP Amitraz Related Compound C RS in methyl acetate

**Sample solution:** 50.0 mg/mL of Amitraz in methyl acetate

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm × 10-m fused silica; coated with a 5-μm layer of liquid phase G27

#### Temperatures

**Detector:** 300°

**Inlet:** 230°

**Column:** See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
125	0	125	5
125	5	270	15

**Carrier gas:** Helium

**Flow rate:** 12 mL/min

**Injection volume:** 1 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between amitraz related compound A and amitraz related compound B

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each of amitraz related compounds A, B, and C in the portion of Amitraz taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of the corresponding related compound from the *Standard solution*

$C_S$  = concentration of the corresponding related compound in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amitraz in the *Sample solution* (mg/mL)

Calculate the percentage of 2,4-dimethylaniline and any other individual impurity in the portion of Amitraz taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of 2,4-dimethylaniline from the *Standard solution*

$C_S$  = concentration of 2,4-dimethylaniline in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amitraz in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 2. The reporting level for impurities is 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
2,4-Dimethylaniline	0.11	0.1
Amitraz related compound A	0.35	2
Amitraz related compound B	0.40	1
Amitraz related compound C	0.86	2
Amitraz	1.0	—
Any other individual impurity	—	0.1

### SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 0.1%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS (11)**
  - USP Amitraz RS
  - USP Amitraz Related Compound A RS
  - 2,4-Dimethylphenyl formamide;  
N-(2,4-Dimethylphenyl)formamide.  
 $C_9H_{11}NO$  149.19
  - USP Amitraz Related Compound B RS
  - 2,4-Dimethylphenyl N-methyl-formamidine;  
N'-(2,4-Dimethylphenyl)-N-methylformimidamide.  
 $C_{10}H_{14}N_2$  162.23
  - USP Amitraz Related Compound C RS
  - Bisformamidine analog;

 $C_{17}H_{20}N_2$  252.35

## Amitraz Concentrate for Dip

### DEFINITION

Amitraz Concentrate for Dip contains amitraz in a suitable vehicle. It may contain a suitable stabilizing agent. It contains NLT 90.0% and NMT 120.0% of the labeled amount of amitraz ( $C_{19}H_{23}N_3$ ).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHY

**Standard solution:** 5 mg/mL of USP Amitraz RS in toluene  
**Sample solution:** Nominally 5 mg/mL of amitraz from Concentrate for Dip diluted with toluene  
**Chromatographic system**  
 (See Chromatography (621), Thin-Layer Chromatography.)  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture  
**Application volume:** 2  $\mu$ L  
**Developing solvent system:** Cyclohexane, ethyl acetate, and triethylamine (5:3:2)  
**Spray reagent:** 0.5% solution of N-(1-naphthyl)ethylenediamine dihydrochloride in methanol

#### Analysis

**Samples:** Standard solution and Sample solution  
 Stand the plate to a depth of 3.5 cm in a solution prepared by dissolving 35 g of acetamide in 100 mL of methanol, adding 100 mL of triethylamine, and diluting to 250 mL with methanol. Allow the wet plate to

stand in a current of cold air for 30 s. Immediately apply the Samples separately to the plate, at a level about 1 cm below the top of the impregnated zone. Promptly develop the plate until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber and allow to air-dry. Examine the plate under short-wave-length UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the Sample solution corresponds to that of the Standard solution.

- **B.** The retention time of the amitraz peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Internal standard solution:** 0.7% v/v solution of squalane in methyl acetate

**Standard solution:** 5.0 mg/mL of USP Amitraz RS in Internal standard solution

**Sample solution:** Nominally equivalent to 5.0 mg/mL of amitraz from Concentrate for Dip in Internal standard solution

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm  $\times$  15-m fused silica; coated with a 1.5- $\mu$ m layer of liquid phase G9

#### Temperatures

**Column:** 220°

**Inlet:** 230°

**Detector:** 300°

**Carrier gas:** Helium

**Flow rate:** 12 mL/min

**Injection volume:** 1  $\mu$ L

#### System suitability

**Sample:** Standard solution

[NOTE—The elution order is amitraz, followed by squalane.]

#### Suitability requirements

**Resolution:** NLT 3.0 between amitraz and squalane

**Relative standard deviation:** NMT 2.0% from the peak area ratio of amitraz to squalane

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of the labeled amount of amitraz ( $C_{19}H_{23}N_3$ ) in the portion of Concentrate for Dip taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of amitraz and squalane from the Sample solution

$R_S$  = peak response ratio of amitraz and squalane from the Standard solution

$C_S$  = concentration of USP Amitraz RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amitraz in the Sample solution (mg/mL)

**Acceptance criteria:** 90.0%–120.0%

### SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 0.15%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate that it is for veterinary use only and that it is to be diluted before use. The label also states the name and quantity of diluent to be used, the directions for dilution, and the conditions for storage of the constituted Concentrate for Dip.

- **USP REFERENCE STANDARDS** (11)  
USP Amitraz RS

## Amitriptyline Hydrochloride

$C_{20}H_{23}N \cdot HCl$  313.86  
1-Propanamine, 3-(10,11-dihydro-5H-dibenzo[a,d]cyclohepten-5-ylidene)-N,N-dimethyl-, hydrochloride;  
10,11-Dihydro-N,N-dimethyl-5H-dibenzo[a,d]cycloheptene- $\Delta^{5,7}$ -propylamine hydrochloride [549-18-8].

### DEFINITION

Amitriptyline Hydrochloride contains NLT 98.0% and NMT 102.0% of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (17K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

### ASSAY

#### • PROCEDURE

**Diluted phosphoric acid:** Phosphoric acid and water (1:10)

**Buffer:** 1.42 g/L of dibasic sodium phosphate ( $Na_2HPO_4$ ) in water, adjusted with *Diluted phosphoric acid* to a pH of 7.7

**Mobile phase:** Methanol and *Buffer* (7:3)

**System suitability stock solution A:** 1 mg/mL of USP Amitriptyline Related Compound A RS in methanol

**System suitability stock solution B:** 0.4 mg/mL of USP Amitriptyline Hydrochloride RS, 0.6 mg/mL each of USP Amitriptyline Related Compound B RS, USP Cyclobenzaprine Hydrochloride RS, and USP Nortriptyline Hydrochloride RS in *Mobile phase*

**Standard solution:** 0.2 mg/mL of USP Amitriptyline Hydrochloride RS in *Mobile phase*

**System suitability solution:** 1  $\mu$ g/mL of amitriptyline hydrochloride, 0.5  $\mu$ g/mL of amitriptyline related compound A, and 1.5  $\mu$ g/mL each of amitriptyline related compound B, cyclobenzaprine hydrochloride, and nortriptyline hydrochloride from suitable volumes of *Standard solution*, *System suitability stock solution A*, and *System suitability stock solution B* in *Mobile phase*

**Sample solution:** 0.2 mg/mL of Amitriptyline Hydrochloride in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L7

**Column temperature:** 45°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

**Run time:** 1.5 times the retention time of amitriptyline

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—For relative retention times, see *Table 1*.]

#### Suitability requirements

**Resolution:** NLT 1.5 between amitriptyline related compound B and nortriptyline, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the amitriptyline peak, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ) in the portion of Amitriptyline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amitriptyline Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amitriptyline Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

#### Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 ppm (Official 1-Jan-2018)

#### • ORGANIC IMPURITIES

Diluted phosphoric acid, Buffer, Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

**Standard solution:** Use the *System suitability solution*, prepared as directed in the *Assay*.

**Sample solution:** 1 mg/mL of Amitriptyline Hydrochloride in *Mobile phase*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentages of the individual amitriptyline related compounds in the portion of Amitriptyline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each amitriptyline related compound from the *Sample solution*

$r_S$  = peak response of the corresponding amitriptyline related compound from the *Standard solution*

$C_S$  = concentration of the corresponding amitriptyline related compound in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amitriptyline Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified impurity in the portion of Amitriptyline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any unspecified impurity from the *Sample solution*

$r_S$  = peak response of USP Amitriptyline Hydrochloride RS from the *Standard solution*

$C_S$  = concentration of USP Amitriptyline Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amitriptyline Hydrochloride in the *Sample solution* (mg/mL)

[NOTE—Discard any peak with a relative retention time less than 0.22.]

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Amitriptyline related compound A	0.35	0.05
Amitriptyline related compound B	0.52	0.15
Nortriptyline	0.60	0.15
Cyclobenzaprine	0.76	0.15
Amitriptyline	1.0	—
Any individual unspecified impurity	—	0.10
Total impurities	—	1.0

### SPECIFIC TESTS

#### • PH (791)

Sample: 10 mg/mL in water

Acceptance criteria: 5.0–6.0, in a solution (1 in 100)

#### • LOSS ON DRYING (731)

Analysis: Dry a sample at a pressure not exceeding 5 mm of mercury at 60° to constant weight.

Acceptance criteria: NMT 0.5%

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in well-closed containers.

#### • USP REFERENCE STANDARDS (11)

USP Amitriptyline Hydrochloride RS

USP Amitriptyline Related Compound A RS

10,11-Dihydro-5H-dibenzo[a,d]cyclohepten-5-one; (also known as dibenzosuberone).

C<sub>15</sub>H<sub>12</sub>O 208.26

USP Amitriptyline Related Compound B RS

5-[3-(Dimethylamino)propyl]-10,11-dihydro-5H-dibenzo[a,d]cyclohepten-5-ol; (also known as amitriptynol).

C<sub>20</sub>H<sub>25</sub>NO 295.42

USP Cyclobenzaprine Hydrochloride RS

USP Nortriptyline Hydrochloride RS

## Amitriptyline Hydrochloride Injection

### DEFINITION

Amitriptyline Hydrochloride Injection is a sterile solution of Amitriptyline Hydrochloride in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of amitriptyline hydrochloride (C<sub>20</sub>H<sub>23</sub>N · HCl).

### IDENTIFICATION

#### • A.

Sample solution: Pipet 1 mL of Injection into a 125-mL separator containing 10 mL of water and 1 mL of 1 N sodium hydroxide, mix, extract with two 10-mL portions of methylene chloride, and evaporate the extracts on a steam bath just to dryness. Dissolve the residue in methanol, add 1 mL of 1.2 N hydrochloric acid, and then add methanol to make 100 mL. Dilute 10 mL of this solution with methanol to 100 mL.

Acceptance criteria: The UV absorption spectrum of this solution exhibits a maximum at the same wavelength as that of a similar solution of USP Amitriptyline Hydrochloride RS, concomitantly measured.

#### • B. The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

Buffer: Dissolve 11.04 g of monobasic sodium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 2.5 ± 0.5, and dilute with water to 1000 mL.

Mobile phase: Acetonitrile and Buffer (42:58)

Standard solution: 0.2 mg/mL of USP Amitriptyline Hydrochloride RS in water

Sample solution: Nominally 0.2 mg/mL of amitriptyline hydrochloride from a suitable volume of the Injection in water

#### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm × 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 20 µL

#### System suitability

Sample: Standard solution

Suitability requirements

Column efficiency: NLT 800 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

#### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of amitriptyline hydrochloride (C<sub>20</sub>H<sub>23</sub>N · HCl) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Amitriptyline Hydrochloride RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amitriptyline hydrochloride in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

### SPECIFIC TESTS

#### • PYROGEN TEST (151)

Sample: Amitriptyline Hydrochloride Injection, diluted with Sodium Chloride Injection containing 0.9% of sodium chloride to a concentration of 2.5 mg of amitriptyline hydrochloride/mL

Acceptance criteria: Meets the requirements for a test dose of 1 mL/kg

#### • PH (791): 4.0–6.0

#### • OTHER REQUIREMENTS: Meets the requirements in Injections and Implanted Drug Products (1)

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

#### • USP REFERENCE STANDARDS (11)

USP Amitriptyline Hydrochloride RS

## Amitriptyline Hydrochloride Tablets

### DEFINITION

Amitriptyline Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of amitriptyline hydrochloride (C<sub>20</sub>H<sub>23</sub>N · HCl).

### IDENTIFICATION

#### • A.

Sample stock solution: Nominally 0.1 mg/mL of amitriptyline hydrochloride in methanol from a suitable

amount of finely powdered Tablets. Filter a portion of the solution, and use the filtrate.

**Sample solution:** Nominally 0.01 mg/mL of amitriptyline hydrochloride from *Sample stock solution* in methanol

**Acceptance criteria:** The UV absorption spectrum of this solution exhibits a maximum at the same wavelength as that of a similar solution of USP Amitriptyline Hydrochloride RS, concomitantly measured.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

## ASSAY

### • PROCEDURE

**Buffer:** 11.04 g of monobasic sodium phosphate in 900 mL of water. Adjust with phosphoric acid to a pH of  $2.5 \pm 0.5$ , and dilute to make 1000 mL.

**Mobile phase:** Acetonitrile and *Buffer* (42:58)

**Standard solution:** 0.2 mg/mL of USP Amitriptyline Hydrochloride RS in *Mobile phase*

**Sample solution:** Nominally 0.2 mg/mL of amitriptyline hydrochloride in *Mobile phase* prepared as follows.

Transfer NLT 20 Tablets to a suitable volumetric flask, add 50% of the flask volume of *Mobile phase*, and shake the mixture for 1 h or until the Tablets have disintegrated. Dilute with *Mobile phase* to volume, and filter. Dilute the clear filtrate with *Mobile phase* to obtain a solution with a nominal concentration of 0.2 mg/mL of amitriptyline hydrochloride.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm  $\times$  30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 800 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ) in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amitriptyline Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amitriptyline hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

### Instrumental conditions

**Analytical wavelength:** UV 239 nm

**Standard solution:** USP Amitriptyline Hydrochloride RS in *Medium*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ) dissolved from UV absorbances of the *Sample solution*, suitably

diluted with *Medium* if necessary, in comparison with a *Standard solution* having a known concentration.

**Tolerances:** NLT 75% (Q) of the labeled amount of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**  
USP Amitriptyline Hydrochloride RS

## Amlodipine Compounded Oral Suspension

### DEFINITION

Amlodipine Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ).

Prepare Amlodipine Compounded Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Amlodipine besylate tablets <sup>a</sup> equivalent to	100 mg of amlodipine
Vehicle: a 1:1 mixture of Ora-Sweet <sup>b</sup> and Ora-Plus, <sup>b</sup> a sufficient quantity to make	100 mL

<sup>a</sup> Norvasc 5-mg tablets, Pfizer, Inc., Groton, CT.

<sup>b</sup> Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of tablets in a suitable mortar and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make an amlodipine liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well. [NOTE—To ensure component uniformity, homogenization is recommended.]

## ASSAY

### • PROCEDURE

**Mobile phase:** Acetonitrile, methanol, and 40 mM ammonium acetate (50:15:35). Filter through a nylon 66 filter of 0.45- $\mu$ m pore size, and degas.

**Standard stock solution:** Dissolve an appropriately weighed amount of USP Amlodipine Besylate RS in methanol, equivalent to 1.0 mg/mL of amlodipine (approximately equal to 1.4 mg/mL of amlodipine besylate).

**Standard solution:** Transfer 1.0 mL of the *Standard stock solution* into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of about 20  $\mu$ g/mL of amlodipine. Centrifuge.

**Sample solution:** Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of Oral Suspension into a 50-mL volumetric flask, rinse the pipet three times with *Mobile phase*, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of about 20  $\mu$ g/mL of amlodipine. Centrifuge.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 240 nm  
 Column: 3.0-mm × 15-cm; 5-μm packing L10  
 Flow rate: 0.4 mL/min  
 Injection volume: 10 μL

#### System suitability

Sample: *Standard solution*

[NOTE—The retention time for amlodipine is about 10.1 min.]

#### Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amlodipine from the *Sample solution*

$r_S$  = peak response of amlodipine from the *Standard solution*

$C_S$  = concentration of amlodipine in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of amlodipine in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–110.0%

#### SPECIFIC TESTS

- **PH (791):** 4.0–5.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored in a refrigerator; NMT 60 days when stored at controlled room temperature
- **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS (11)**  
 USP Amlodipine Besylate RS

## Amlodipine and Benazepril Hydrochloride Capsules

#### DEFINITION

Amlodipine and Benazepril Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amounts of each of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ) and benazepril hydrochloride ( $C_{24}H_{28}N_2O_5 \cdot HCl$ ).

#### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

#### ASSAY

##### PROCEDURE

**Buffer 1:** 0.7% (v/v) of triethylamine in water. Adjust with phosphoric acid to a pH of 3.0, and add 1.2 g of tetrabutyl ammonium hydrogen sulfate per 1 L of *Buffer*. Pass through a suitable filter of 0.45-μm pore size.

**Buffer 2:** 7.0 mL/L of triethylamine in water. Adjust with phosphoric acid to a pH of 3.0. Pass through a suitable filter of 0.45-μm pore size.

**Diluent:** Acetonitrile, methanol, and *Buffer 2* (20:30:50)

**Mobile phase:** Acetonitrile, methanol, and *Buffer 1* (10:30:70)

**Standard solution:** Prepare the corresponding solutions in *Diluent* as directed in Table 1.

Table 1

Strength of Capsule (Amlodipine (mg)/ Benazepril Hydrochloride (mg))	Concentration of Amlodipine Besylate/Benazepril Hydrochloride (mg/mL)
2.5/10	0.18/0.5
5/20	0.18/0.5
5/10	0.18/0.25
10/20	0.36/0.5
5/40 and 10/40	0.04/0.16

Pass through a suitable membrane filter of 0.45-μm pore size.

**Sample solution:** Transfer the contents of five Capsules into a volumetric flask as given in Table 2. Add *Diluent* (about 70% of the volume of the flask) and keep on a rotary shaker for about 45 min, sonicate for 30 min with occasional shaking, and dilute with *Diluent* to volume. Centrifuge a portion of the above solution at 3000 rpm for 10 min, and pass through a filter of 0.45-μm pore size.

Table 2

Strength of Capsule (Amlodipine (mg)/ Benazepril Hydrochloride (mg))	Concentration of Amlodipine/Benazepril Hydrochloride (mg/mL)
2.5/10	0.125/0.5
5/20	0.125/0.5
5/10	0.125/0.25
10/20	0.25/0.5
5/40	0.02/0.16
10/40	0.04/0.16

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 237 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1.2 mL/min

Injection volume: 10 μL

Run time: Two times the retention time of amlodipine

#### System suitability

Sample: *Standard solution*

#### Suitability requirements

Tailing factor: NMT 2.0 for both amlodipine and benazepril peaks

Relative standard deviation: NMT 2.0% for both amlodipine and benazepril peaks

#### Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = response of the amlodipine peak from the *Sample solution*

$r_S$  = response of the amlodipine peak from the *Standard solution*

$C_S$  = concentration of amlodipine in the *Standard solution* (mg/mL)

- $C_U$  = nominal concentration of amlodipine in the Sample solution (mg/mL)  
 $M_{r1}$  = molecular weight of amlodipine, 408.88  
 $M_{r2}$  = molecular weight of amlodipine besylate, 567.05

Calculate the percentage of the labeled amount of benazepril hydrochloride ( $C_{24}H_{28}N_2O_5 \cdot HCl$ ), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = response of the benazepril peak from the Sample solution  
 $r_S$  = response of the benazepril peak from the Standard solution  
 $C_S$  = concentration of benazepril hydrochloride in the Standard solution (mg/mL)  
 $C_U$  = nominal concentration of benazepril hydrochloride in the Sample solution (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of amlodipine free base and 90.0%–110.0% of the labeled amount of benazepril hydrochloride

## PERFORMANCE TESTS

### • DISSOLUTION (711)

**Medium:** 0.01 N hydrochloric acid; 500 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Buffer:** 2.72 g/L of potassium dihydrogen phosphate in water. Add 0.2% (v/v) of triethylamine per L. Adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** Acetonitrile, methanol, and Buffer (15:35:50)

**Amlodipine besylate standard stock solution:**

0.385 mg/mL of USP Amlodipine Besylate RS in Medium

**Benazepril hydrochloride standard stock solution:**

0.225 mg/mL of USP Benazepril Hydrochloride RS in Medium

**Standard solution:** Dilute aliquots of the Amlodipine besylate standard stock solution and Benazepril hydrochloride standard stock solution with Medium as per Table 3.

Table 3

Strength of the Capsule (Amlodipine/Benazepril Hydrochloride) (mg/mg)	Volume of Amlodipine Besylate Standard Stock Solution/Volume of Benazepril Hydrochloride Standard Stock Solution (mL)	Volume of the Flask (mL)
2.5/10	1/5	50
5/10	2/5	50
5/20	2/10	50
10/20	2/5	25

For Tablet strengths 5/40 (Amlodipine/Benazepril Hydrochloride, mg/mg): 0.01 mg/mL of USP Amlodipine RS and 0.08 mg/mL of USP Benazepril Hydrochloride RS in Medium.

For Tablet strengths 10/40 (Amlodipine/Benazepril Hydrochloride, mg/mg): 0.02 mg/mL of USP Amlodipine RS and 0.08 mg/mL of USP Benazepril Hydrochloride RS in Medium.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 237 nm

**Column:** 4.6-mm  $\times$  10-cm; 3- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 50  $\mu$ L

### System suitability

**Sample:** Standard solution

### Suitability requirements

**Tailing factor:** NMT 2.0 for both amlodipine and benazepril peaks

**Relative standard deviation:** NMT 2.0% for both amlodipine and benazepril peaks

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

- $r_U$  = peak response for amlodipine from the Sample solution  
 $r_S$  = peak response for amlodipine from the Standard solution  
 $C_S$  = concentration of USP Amlodipine Besylate RS in the Standard solution  
 $L$  = label claim for amlodipine (mg/Capsule)  
 $M_{r1}$  = molecular weight of amlodipine, 408.88  
 $M_{r2}$  = molecular weight of amlodipine besylate, 567.05  
 $V$  = volume of Medium, 500 mL

Calculate the percentage of the labeled amount of benazepril hydrochloride ( $C_{24}H_{28}N_2O_5 \cdot HCl$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

- $r_U$  = peak response for benazepril from the Sample solution  
 $r_S$  = peak response for benazepril from the Standard solution  
 $C_S$  = concentration of benazepril hydrochloride in the Standard solution  
 $L$  = label claim for benazepril hydrochloride (mg/Capsule)  
 $V$  = volume of Medium, 500 mL

**Tolerances:** NLT 80% (Q) of the labeled amounts of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ) and benazepril hydrochloride ( $C_{24}H_{28}N_2O_5 \cdot HCl$ ) are dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### • PROCEDURE

**Buffer 1, Buffer 2, and Diluent:** Proceed as directed in the Assay.

**Solution A:** Acetonitrile and Buffer 1 (20:80)

**Solution B:** Methanol and Buffer 1 (80:20)

**Mobile phase:** See Table 4.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	85	15
100	30	70
101	85	15
110	85	15

**Standard stock solution:** 0.36 mg/mL of amlodipine and amlodipine related compound A and 1 mg/mL each of benazepril hydrochloride and benazepril related compound C solution in Diluent

**Standard solution:** 1  $\mu$ g/mL of amlodipine and amlodipine related compound A and 3  $\mu$ g/mL each of benazepril hydrochloride and benazepril related compound C solution in Diluent

**Sample solution:** 0.25 mg/mL of amlodipine from powdered Capsules (NLT 20). [NOTE—The benazepril hydrochloride concentration may vary depending on the ratio of amlodipine to benazepril hydrochloride in the Capsule.] Initially add *Diluent*, about 70% of the volume of the flask, sonicate for 30 min with intermittent shaking, and dilute with *Diluent* to volume. Pass through a membrane filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 237 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection volume:** 40  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for both amlodipine and benazepril peaks

**Resolution:** NLT 2.0 between the amlodipine and benazepril peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amlodipine related compound A in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = response of amlodipine related compound A from the *Sample solution*

$r_S$  = response of amlodipine related compound A from the *Standard solution*

$C_S$  = concentration of amlodipine related compound A in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of amlodipine related compound A, 408.88

$M_{r2}$  = molecular weight of amlodipine related compound A fumarate, 522.93

Calculate the percentage of benazepril related compound C in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of benazepril related compound C from the *Sample solution*

$r_S$  = response of benazepril related compound C from the *Standard solution*

$C_S$  = concentration of benazepril related compound C in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of benazepril hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = response of each other impurity from the *Sample solution*

$r_T$  = sum of responses of all peaks from the *Sample solution*

**Acceptance criteria:** See *Table 5*.

**Table 5**

Impurity Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Benazepril related compound C <sup>a</sup>	0.23	3.0
Amlodipine related compound A <sup>b</sup>	0.44	1.0
Amlodipine	1.00	—
Benazepril	1.20	—
Any other individual unspecified impurity	—	0.2
Total impurities <sup>c</sup>	—	5.0

[NOTE—Disregard the peaks at relative retention times of 0.09 and 0.10.]

<sup>a</sup> [3-(1-Carboxy-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine]-1-acetic acid.

<sup>b</sup> 3-Ethyl, 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate].

<sup>c</sup> Total impurities include the sum of all impurities. The process-related impurities are not included.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS (11)**

USP Amlodipine Besylate RS

USP Amlodipine Related Compound A RS

3-Ethyl, 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate] fumarate.

C<sub>20</sub>H<sub>23</sub>ClN<sub>2</sub>O<sub>5</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub> 522.93

USP Benazepril Hydrochloride RS

USP Benazepril Related Compound C RS

3-(1-Carboxy-3-phenyl-1(*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid.

C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>5</sub> 396.44

## Amlodipine and Valsartan Tablets

### DEFINITION

#### Change to read:

Amlodipine and Valsartan Tablets contain <sup>o</sup>NLT 90.0% and NMT 110.0% <sup>o</sup>(RB 1-Jun-2016) of the labeled amount of amlodipine (C<sub>20</sub>H<sub>25</sub>ClN<sub>2</sub>O<sub>5</sub>) and valsartan (C<sub>24</sub>H<sub>29</sub>N<sub>5</sub>O<sub>3</sub>).

### IDENTIFICATION

- **A.** The UV absorption spectra of the major peaks of *Sample solution A* and *Sample solution B* and those of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*.
- **B.** The retention times of the major peaks of *Sample solution A* and *Sample solution B* correspond to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### Change to read:

#### PROCEDURE

**Solution A:** Water and triethylamine (1000:10). Adjust with phosphoric acid to a pH of 2.8.

**Solution B:** Methanol and acetonitrile (700:300)

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	50	50
3	50	50
15	30	70
20	30	70
20.1	50	50
25	50	50

**Diluent:** Solution A and Solution B (50:50)

**Standard solution:** 0.14 mg/mL of USP Amlodipine Besylate RS and 0.16 mg/mL of USP Valsartan RS. Add methanol to 5% of the final volume to dissolve, and dilute with Diluent to volume.

**Sample stock solution:** Transfer NLT 10 Tablets into a suitable volumetric flask. Initially add water to 10% of the final volume, and sonicate to disperse as needed. Add Diluent, using about 70% of the final volume, and shake for up to 45 min to disperse. Following dispersion, sonicate for 15 min, and shake for 30 min. Dilute with Diluent to volume to obtain a solution containing known nominal concentrations of 0.1–0.2 mg/mL of amlodipine and 1.6–6.4 mg/mL of valsartan. Centrifuge the solution for about 10 min at 3000 rpm.

**Sample solution A:** Nominally equivalent to 0.1 mg/mL of amlodipine in Diluent from Sample stock solution

**Sample solution B:** Nominally equivalent to 0.16 mg/mL of valsartan in Diluent from Sample stock solution

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector**

**Assay:** UV 237 nm

**Identification A:** Diode array, •UV 200–400 nm• (RB 1-jun-2016)

**Column:** 3.9-mm × 15-cm; 5-μm packing L1

**Temperatures**

**Autosampler:** 10°

**Column:** 30°

**Flow rate:** 1.0 mL/min

**Injection volume:** 10 μL

**System suitability**

**Sample:** Standard solution

**Suitability requirements**

**Tailing factor:** NMT 1.5 for both amlodipine and valsartan

**Relative standard deviation:** NMT 2.0% for amlodipine and valsartan

#### Analysis

**Samples:** Standard solution, Sample solution A, and Sample solution B

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of amlodipine from Sample solution A

$r_S$  = peak response of amlodipine from the Standard solution

$C_S$  = concentration of USP Amlodipine Besylate RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amlodipine in Sample solution A (mg/mL)

$M_{r1}$  = molecular weight of amlodipine, 408.88

$M_{r2}$  = molecular weight of amlodipine besylate, 567.05

Calculate the percentage of the labeled amount of valsartan ( $C_{24}H_{29}N_5O_3$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of valsartan from Sample solution B

$r_S$  = peak response of valsartan from the Standard solution

$C_S$  = concentration of USP Valsartan RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of valsartan in Sample solution B (mg/mL)

**Acceptance criteria:** •90.0%–110.0%• (RB 1-jun-2016)

## PERFORMANCE TESTS

### Change to read:

#### • DISSOLUTION <711>

**Test 1•** (RB 1-jun-2016)

**Buffer:** Dissolve 6.805 g of monobasic potassium phosphate and 0.896 g of sodium hydroxide in water, and dilute with water to 1000 mL. Adjust with 0.2 N sodium hydroxide or 1 M phosphoric acid to a pH of 6.8.

**Medium:** Buffer; 1000 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Mobile phase:** Acetonitrile, water, and trifluoroacetic acid (500:500:2)

**Diluent:** 1 mg/mL of polysorbate 80 in Buffer

**System suitability solution:** 0.4 mg/mL each of USP Amlodipine Besylate RS and USP Valsartan RS prepared as follows. Initially dissolve in methanol to 40% of the total volume, and dilute with Buffer to volume.

**Standard stock solution A:** 0.072 mg/mL of USP Amlodipine Besylate RS prepared as follows. Initially dissolve in methanol to 4% of the final volume, and dilute with Diluent to volume.

**Standard stock solution B:** 2.2 mg/mL of USP Valsartan RS in methanol

**Standard solution:** ( $L_1/1000$ ) mg/mL of amlodipine and ( $L_2/1000$ ) mg/mL of valsartan in Diluent from Standard stock solution A and Standard stock solution B, where  $L_1$  is the label claim of amlodipine in mg/Tablet, and  $L_2$  is the label claim of valsartan in mg/Tablet.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size. Discard the first 10 mL of the filtrate.

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 15-cm; 4-μm packing L11

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection volume:** 10 μL

**Run time:** NLT 2 times the retention time of amlodipine

#### System suitability

**Samples:** System suitability solution and Standard solution

#### Suitability requirements

**Resolution:** NLT 2.0 between amlodipine and valsartan, System suitability solution

**Tailing factor:** NMT 2.0 for amlodipine and valsartan, Standard solution

**Relative standard deviation:** NMT 2.0% for amlodipine and valsartan, Standard solution

#### Analysis

**Samples:** Standard solution and Sample solution  
Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (M_{r1}/M_{r2}) \times (1/L_1) \times 100$$

$r_U$  = peak response of amlodipine from the Sample solution

$r_s$  = peak response of amlodipine from the *Standard solution*  
 $C_s$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 1000 mL  
 $M_{r1}$  = molecular weight of amlodipine, 408.88  
 $M_{r2}$  = molecular weight of amlodipine besylate, 567.05

$L_1$  = label claim for amlodipine (mg/Tablet)  
 Calculate the percentage of the labeled amount of valsartan ( $C_{24}H_{29}N_5O_3$ ) dissolved:

$$\text{Result} = (r_u/r_s) \times C_s \times V \times (1/L_2) \times 100$$

$r_u$  = peak response of valsartan from the *Sample solution*  
 $r_s$  = peak response of valsartan from the *Standard solution*  
 $C_s$  = concentration of USP Valsartan RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 1000 mL  
 $L_2$  = label claim for valsartan (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) and valsartan ( $C_{24}H_{29}N_5O_3$ ) is dissolved.

• **Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium and Time:** Proceed as directed in *Dissolution Test 1*; 1000 mL.

**Apparatus 2:** 50 rpm

**Buffer:** Mix 7.0 mL of triethylamine with 1000 mL of water. Adjust with phosphoric acid to a pH of 3.0.

**Solution A:** Acetonitrile and *Buffer* (10:90)

**Solution B:** Acetonitrile and *Buffer* (90:10)

**Mobile phase:** See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	80	20
7	30	70
8	80	20
10	80	20

**Standard stock solution A:** 0.14 mg/mL of USP Amlodipine Besylate RS prepared as follows. Initially dissolve in 10% of the final volume of methanol, and dilute with *Medium* to volume.

**Standard stock solution B:** 1.6 mg/mL of USP Valsartan RS in methanol

**Standard solution:** ( $L_1/1000$ ) mg/mL of amlodipine and ( $L_2/1000$ ) mg/mL of valsartan in *Diluent* from *Standard stock solution A* and *Standard stock solution B*, where  $L_1$  is the label claim of amlodipine in mg/Tablet, and  $L_2$  is the label claim of valsartan in mg/Tablet.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 1- $\mu$ m pore size.

**Chromatographic system**  
 (See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 237 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Temperatures**

**Autosampler:** 10°

**Column:** 50°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0 for amlodipine and valsartan

**Relative standard deviation:** NMT 2.0% for amlodipine and valsartan

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) dissolved:

$$\text{Result} = (r_u/r_s) \times C_s \times V \times (M_{r1}/M_{r2}) \times (1/L_1) \times 100$$

$r_u$  = peak response of amlodipine from the *Sample solution*

$r_s$  = peak response of amlodipine from the *Standard solution*

$C_s$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 1000 mL

$M_{r1}$  = molecular weight of amlodipine, 408.88

$M_{r2}$  = molecular weight of amlodipine besylate, 567.05

$L_1$  = label claim for amlodipine (mg/Tablet)

Calculate the percentage of the labeled amount of valsartan ( $C_{24}H_{29}N_5O_3$ ) dissolved:

$$\text{Result} = (r_u/r_s) \times C_s \times V \times (1/L_2) \times 100$$

$r_u$  = peak response of valsartan from the *Sample solution*

$r_s$  = peak response of valsartan from the *Standard solution*

$C_s$  = concentration of USP Valsartan RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 1000 mL

$L_2$  = label claim for valsartan (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) and NLT 80% (Q) of the labeled amount of valsartan ( $C_{24}H_{29}N_5O_3$ ) is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium, Apparatus 2, and Time:** Proceed as directed in *Dissolution Test 1*.

**Solution A:** Acetonitrile, trifluoroacetic acid, and water (10:0.1:90)

**Solution B:** Acetonitrile, trifluoroacetic acid, and water (90:0.1:10)

**Mobile phase:** See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0.01	90	10
2.5	10	90
3.0	90	10
5.0	90	10

**Diluent:** Acetonitrile and water (50:50)

**Standard stock solution A:** 0.14 mg/mL of USP Amlodipine Besylate RS prepared as follows. Initially dissolve in *Diluent* about 4% of the final volume, and dilute with *Medium* to volume.

**Standard stock solution B:** 1.6 mg/mL of USP Valsartan RS prepared as follows. Initially dissolve in about 20% of the final volume of *Diluent*, and dilute with *Medium* to volume.

**Standard solution:** ( $L_1/1000$ ) mg/mL of amlodipine and ( $L_2/1000$ ) mg/mL of valsartan in *Medium* from *Standard stock solution A* and *Standard stock solution B*, where  $L_1$  is the label claim of amlodipine in mg/Tablet, and  $L_2$  is the label claim of valsartan in mg/Tablet.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size and discard the first few mL of the filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 237 nm for amlodipine and UV 270 nm for valsartan

#### IMPURITIES

##### Change to read:

#### • ORGANIC IMPURITIES

Mobile phase, Diluent, Sample solution A, Sample solution B, and Chromatographic system: Proceed as directed in the Assay.

Standard stock solution A: Prepare as directed for the Standard solution in the Assay.

System suitability solution: Dissolve a suitable quantity of USP Valsartan Related Compound B RS in Standard stock solution A to obtain a solution containing 0.08 mg/mL of USP Valsartan Related Compound B RS, 0.14 mg/mL of USP Amlodipine Besylate RS, and 0.16 mg/mL of USP Valsartan RS.

Sensitivity solution: 0.14 μg/mL of USP Amlodipine Besylate RS and 0.16 μg/mL of USP Valsartan RS in Diluent from Standard stock solution A

Standard stock solution B: 0.1 mg/mL of USP Amlodipine Related Compound A RS as free base prepared as follows. Add methanol to 5% of the final volume to dissolve, and dilute with Diluent to volume.

Standard solution: 0.0005 mg/mL of USP Amlodipine Related Compound A RS as free base, and 0.0003 mg/mL each of USP Amlodipine Besylate RS and USP Valsartan RS in Diluent from Standard stock solution A and Standard stock solution B, respectively

#### System suitability

Samples: System suitability solution, Sensitivity solution, and Standard solution

#### Suitability requirements

Resolution: More than 4.0 between amlodipine and valsartan related compound B and more than 4.0 between valsartan related compound B and valsartan, System suitability solution

Relative standard deviation: NMT 5.0% for amlodipine related compound A, amlodipine, and valsartan, Standard solution

Signal-to-noise ratio: NLT 10 for amlodipine and valsartan, Sensitivity solution

#### Analysis

Samples: Sample solution A, Sample solution B, and Standard solution

Calculate the percentage of amlodipine related compound A free base in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of amlodipine related compound A from Sample solution A

$r_S$  = peak response of amlodipine related compound A from the Standard solution

$C_S$  = concentration of USP Amlodipine Related Compound A RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amlodipine in Sample solution A (mg/mL)

$M_{r1}$  = molecular weight of amlodipine related compound A free base, 406.86

$M_{r2}$  = molecular weight of amlodipine related compound A fumarate, 522.93

Calculate the percentage of valsartan related degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of valsartan related degradation product from Sample solution B

$r_S$  = peak response of valsartan from the Standard solution

$C_S$  = concentration of USP Valsartan RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of valsartan in Sample solution B (mg/mL)

Calculate the percentage of each unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of each unspecified degradation product from Sample solution A

$r_S$  = peak response of amlodipine from the Standard solution

$C_S$  = concentration of USP Amlodipine Besylate RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amlodipine in Sample solution A (mg/mL)

$M_{r1}$  = molecular weight of amlodipine, 408.88

$M_{r2}$  = molecular weight of amlodipine besylate, 567.05

Acceptance criteria: See Table 4. Disregard valsartan related compound B, the benzenesulfonic acid peak at relative retention time 0.19, and any peaks below 0.1%.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

## Amlodipine, Valsartan, and Hydrochlorothiazide Tablets

**DEFINITION****Change to read:**

Amlodipine, Valsartan, and Hydrochlorothiazide Tablets contain  $\bullet$ NLT 92.5% and NMT 107.5% (RB 1-Jun-2016) each of the labeled amounts of amlodipine (C<sub>20</sub>H<sub>25</sub>ClN<sub>2</sub>O<sub>5</sub>), valsartan (C<sub>24</sub>H<sub>29</sub>N<sub>5</sub>O<sub>3</sub>), and hydrochlorothiazide (C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub>).

**IDENTIFICATION**

- **A.** The UV absorption spectra of the amlodipine, valsartan, and hydrochlorothiazide peaks of *Sample solution A*, *Sample solution B*, and *Sample solution C* and those of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*.
- **B.** The retention times of the amlodipine, valsartan, and hydrochlorothiazide peaks of *Sample solution A*, *Sample solution B*, and *Sample solution C* correspond to those of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****Change to read:**• **PROCEDURE**

Use amber glassware for all solutions containing drug substances.

**Solution A:** Acetonitrile, water, and phosphoric acid (50:950:1)

**Solution B:** Acetonitrile, water, and phosphoric acid (950:50:1)

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
3	50	50
6	40	60
10	5	95
10.1	95	5
15	95	5

**Diluent:** Acetonitrile and water (500:500)

**0.1% Phosphoric acid:** Water and phosphoric acid (1000:1)

**Standard solution:** 0.14 mg/mL of USP Amlodipine Besylate RS, 0.064 mg/mL of USP Valsartan RS, and 0.025 mg/mL of USP Hydrochlorothiazide RS in *Diluent*

**Sample stock solution:** Transfer NLT 10 Tablets into a suitable volumetric flask. Add 0.1% Phosphoric acid to 4% of the total volume to disperse the Tablets. Sonicate for 10 min. Add 4% of the total volume of acetonitrile, swirl to mix, and add 60% of the total volume of *Diluent*. Sonicate for 20 min. Dilute with *Diluent* to volume to obtain solutions of nominal concentrations stated in *Table 2*. Centrifuge, and use the clear supernatant.

Table 2

Tablet Strength Amlodipine/ Valsartan/ Hydrochlorothiazide (mg/mg/ mg)	Nominal Concentration of Amlodipine (mg/mL)	Nominal Concentration of Valsartan (mg/mL)	Nominal Concentration of Hydrochlorothiazide (mg/mL)
5/160/12.5	0.1	3.2	0.25
10/160/12.5	0.2	3.2	0.25
5/160/25	0.1	3.2	0.5
10/160/25	0.2	3.2	0.5
10/320/25	0.1	3.2	0.25

**Sample solution A:** Nominally equivalent to 0.1 mg/mL of amlodipine in *Diluent* from *Sample stock solution*

**Sample solution B:** Nominally equivalent to 0.064 mg/mL of valsartan in *Diluent* from *Sample stock solution*

**Sample solution C:** Nominally equivalent to 0.025 mg/mL of hydrochlorothiazide in *Diluent* from *Sample stock solution*

 Calculate the percentage of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L_3) \times 100$$

$r_U$  = peak response of hydrochlorothiazide from the *Sample solution*  
 $r_S$  = peak response of hydrochlorothiazide from the *Standard solution*  
 $C_S$  = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 900 mL  
 $L_3$  = label claim for hydrochlorothiazide (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) is dissolved, NLT 80% (Q) of the labeled amount of valsartan ( $C_{24}H_{29}N_5O_3$ ) is dissolved, and NLT 80% (Q) of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** Proceed as directed under *Dissolution Test 1*, 900 mL.

#### Apparatus 2

For Tablets labeled to contain amlodipine/valsartan/hydrochlorothiazide, 5/160/12.5, 10/160/12.5, 5/160/25, 10/160/25, and 5/80/12.5 (mg/mg): 50 rpm

For Tablets labeled to contain amlodipine/valsartan/hydrochlorothiazide, 10/320/25 (mg/mg): 55 rpm

**Time:** 30 min for valsartan and hydrochlorothiazide, 45 min for amlodipine

**Buffer:** Mix 7.0 mL of triethylamine with 1000 mL of water. Adjust with phosphoric acid to a pH of 3.0.

**Solution A:** Acetonitrile and *Buffer* (10:90).

**Solution B:** Acetonitrile and *Buffer* (90:10).

**Mobile phase:** See *Table 4*.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	90	10
7	30	70
8	90	10
15	90	10

**Standard stock solution A:** 0.35 mg/mL of USP Amlodipine Besylate RS prepared as follows. Initially dissolve in 10% of the final volume of methanol and dilute with *Medium* to volume.

**Standard stock solution B:** 1.6 mg/mL of USP Valsartan RS in methanol

**Standard stock solution C:** 0.7 mg/mL of USP Hydrochlorothiazide RS prepared as follows. Initially dissolve

in 25% of the final volume of methanol and dilute with *Medium* to volume.

**Standard solution:** ( $L_1/1000$ ) mg/mL of amlodipine, ( $L_2/1000$ ) mg/mL of valsartan, and ( $L_3/1000$ ) mg/mL of hydrochlorothiazide in *Diluent* from *Standard stock solution A*, *Standard stock solution B*, and *Standard stock solution C*, where  $L_1$  is the label claim of amlodipine in mg/Tablet,  $L_2$  is the label claim of valsartan in mg/Tablet, and  $L_3$  is the label claim of hydrochlorothiazide in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 1- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 237 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Temperatures**

**Autosampler:** 10°

**Column:** 50°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for each peak

**Relative standard deviation:** NMT 2.0% for each peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (M_{r1}/M_{r2}) \times (1/L_1) \times 100$$

$r_U$  = peak response of amlodipine from the *Sample solution*  
 $r_S$  = peak response of amlodipine from the *Standard solution*  
 $C_S$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 900 mL  
 $M_{r1}$  = molecular weight of amlodipine, 408.88  
 $M_{r2}$  = molecular weight of amlodipine besylate, 567.05  
 $L_1$  = label claim for amlodipine (mg/Tablet)  
 Calculate the percentage of the labeled amount of valsartan ( $C_{24}H_{29}N_5O_3$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L_2) \times 100$$

$r_U$  = peak response of valsartan from the *Sample solution*  
 $r_S$  = peak response of valsartan from the *Standard solution*  
 $C_S$  = concentration of USP Valsartan RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 900 mL  
 $L_2$  = label claim for valsartan (mg/Tablet)

Calculate the percentage of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L_3) \times 100$$

$r_U$  = peak response of hydrochlorothiazide from the *Sample solution*  
 $r_S$  = peak response of hydrochlorothiazide from the *Standard solution*  
 $C_S$  = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 900 mL  
 $L_3$  = label claim for hydrochlorothiazide (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) is dissolved, NLT 80% (Q)

of the labeled amount of valsartan ( $C_{24}H_{29}N_5O_3$ ) is dissolved, and NLT 80% (Q) of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 3.

**Medium:** Dissolve 6.80 g of monobasic potassium phosphate in 1000 mL of water. Adjust with 10% sodium hydroxide solution to a pH of 6.8; 1000 mL for valsartan and hydrochlorothiazide; 900 mL for amlodipine.

**Apparatus 2:** 50 rpm for valsartan and hydrochlorothiazide; 55 rpm for amlodipine in Tablets labeled to contain amlodipine/valsartan/hydrochlorothiazide, 10/320/25 (mg/mg/mg); and 50 rpm for amlodipine in Tablets labeled to contain amlodipine/valsartan/hydrochlorothiazide, 5/160/12.5, 10/160/12.5, 5/160/25, 10/160/25, and 5/80/12.5 (mg/mg/mg).

**Times:** 30 min for valsartan and hydrochlorothiazide, 45 min for amlodipine.

**Solution A:** Acetonitrile, trifluoroacetic acid and water (10:0.1:90).

**Solution B:** Acetonitrile, trifluoroacetic acid and water (90:0.1:10).

**Mobile phase:** See Table 5.

Table 5

Time (min)	Solution A (%)	Solution B (%)
0.01	90	10
2.5	10	90
3.0	90	10
5.0	90	10

**Diluent:** Acetonitrile and water (50:50).

**Standard stock solution A:** 0.15 mg/mL of USP Amlodipine Besylate RS in *Medium* prepared as follows. Initially dissolve and sonicate in 5% of the final volume of *Diluent* and dilute with *Medium* to volume.

**Standard stock solution B:** 1.6 mg/mL of USP Valsartan RS in *Medium* prepared as follows. Initially dissolve and sonicate in 20% of the final volume of *Diluent* and dilute with *Medium* to volume.

**Standard stock solution C:** 0.25 mg/mL of USP Hydrochlorothiazide RS in *Medium* prepared as follows. Initially dissolve and sonicate in 10% of the final volume of *Diluent* and dilute with *Medium* to volume.

**Standard solution:** ( $L_1/1000$ ) mg/mL of amlodipine, ( $L_2/1000$ ) mg/mL of valsartan, and ( $L_3/1000$ ) mg/mL of hydrochlorothiazide in *Diluent* from *Standard stock solution A*, *Standard stock solution B*, and *Standard stock solution C*, where  $L_1$  is the label claim of amlodipine in mg/Tablet,  $L_2$  is the label claim of Valsartan in mg/Tablet, and  $L_3$  is the label claim of hydrochlorothiazide in mg/Tablet.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size. Discard at least the first few mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 237 for amlodipine and UV 270 nm for valsartan and hydrochlorothiazide.

**Column:** 4.6-mm  $\times$  10-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0 for each peak

**Relative standard deviation:** NMT 2.0% for each peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*. Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (M_{r1}/M_{r2}) \times (1/L_1) \times 100$$

$r_U$  = peak response of amlodipine from the *Sample solution*

$r_S$  = peak response of amlodipine from the *Standard solution*

$C_S$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)

 $C_U$  = nominal concentration of amlodipine in *Sample solution A* (mg/mL)  
 $M_{r1}$  = molecular weight of amlodipine related compound A free base, 406.86  
 $M_{r2}$  = molecular weight of amlodipine related compound A fumarate, 522.93

Calculate the percentage of any valsartan related degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of any valsartan related degradation product from *Sample solution B*  
 $r_S$  = peak response of valsartan from the *Standard solution*  
 $C_S$  = concentration of USP Valsartan RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of valsartan in *Sample solution B* (mg/mL)

Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of benzothiadiazine related compound A from *Sample solution C*  
 $r_S$  = peak response of benzothiadiazine related compound A from the *Standard solution*

$C_S$  = concentration of USP Benzothiadiazine Related Compound A RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of hydrochlorothiazide in *Sample solution C* (mg/mL)

Calculate the percentage of <sup>a</sup>chlorothiazide and hydrochlorothiazide dimer<sup>c</sup> (RB 1-Jun-2016) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of <sup>a</sup>chlorothiazide or hydrochlorothiazide dimer<sup>c</sup> (RB 1-Jun-2016) from *Sample solution C*  
 $r_S$  = peak response of hydrochlorothiazide from the *Standard solution*  
 $C_S$  = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of hydrochlorothiazide in *Sample solution C* (mg/mL)

Calculate the percentage of each unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of each unspecified degradation product from *Sample solution A*  
 $r_S$  = peak response of amlodipine from the *Standard solution*  
 $C_S$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of amlodipine in *Sample solution A* (mg/mL)  
 $M_{r1}$  = molecular weight of amlodipine, 408.88  
 $M_{r2}$  = molecular weight of amlodipine besylate, 567.05

**Acceptance criteria:** See <sup>a</sup>Table 6<sup>a</sup> (RB 1-Jun-2016) Disregard amlodipine ethyl analog peak, valsartan related compound B peak, and any peaks below 0.1%.

**Amlodipine Besylate** $C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$  567.05

3,5-Pyridinedicarboxylic acid, 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-1,4-dihydro-6-methyl-, 3-ethyl 5-methyl ester, (±)-, monobenzenesulfonate.

3-Ethyl 5-methyl (±)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylate, monobenzenesulfonate [111470-99-6].

Monohydrate 585.07

» Amlodipine Besylate is anhydrous or hydrated and contains not less than 97.0 percent and not more than 102.0 percent of  $C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, protected from light. Store at room temperature.

**USP Reference standards (11)**—

USP Amlodipine Besylate RS

**Labeling**—Where it is the hydrated form, the label so indicates.

**Identification**—*A: Infrared Absorption* (197M).

*B:* The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Optical rotation** (781A): between  $-0.10^\circ$  and  $+0.10^\circ$ , measured at  $20^\circ$ .

*Test solution:* 10 mg per mL, in methanol.

**Water Determination, Method I** (921): not more than 0.5% for the anhydrous form. If labeled as the hydrated form, the limit is between 3.1% and 5.0%.

**Residue on ignition** (281): not more than 0.2%.

**Delete the following:**

• **Heavy metals, Method II** (231): 0.002%. (Official 1-Jan-2018)

**Related compounds**—

TEST 1—

*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture.

*Test solution*—Transfer 140 mg of Amlodipine Besylate to a 2-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

*System suitability solution*—Transfer about 14 mg of USP Amlodipine Besylate RS to a suitable container, dissolve in 0.2 mL of methanol, and mix.

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in methanol to obtain a solution containing 7.0 mg per mL.

*Standard solution 1*—Transfer 3.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

**Standard solution 2**—Transfer 1.0 mL of the *Standard solution* to another 100-mL volumetric flask, dilute with methanol to volume, and mix.

**Application volume:** 10  $\mu$ L.

**Developing solvent system**—Use the upper layer of a mixture of methyl isobutyl ketone, water, and glacial acetic acid (50:25:25).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Dry the plate for 15 minutes at 80°. Examine the plate under UV light at 254 nm and 365 nm. The chromatogram from the *System suitability solution* shows two clearly separated minor spots with  $R_f$  values of about 0.18 and 0.22. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*. Any spot obtained from the *Test solution*, except for the principal spot, is not greater in size than the spot obtained from *Standard solution 1* (0.3%), and at most two spots are more intense than the spot obtained from *Standard solution 2* (0.1%).

#### TEST 2—

**pH 3.0 Buffer and Mobile phase**—Prepare as directed in the *Assay*.

**System suitability solution**—Dissolve about 5 mg of Amlodipine Besylate in 5 mL of hydrogen peroxide, and heat at 70° for 45 minutes.

**Standard solution**—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.003 mg per mL.

**Test solution**—Transfer about 50 mg of Amlodipine Besylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between amlodipine impurity A and amlodipine is not less than 4.5. [NOTE—For the purpose of identification, the relative retention times are about 0.2 for benzene sulfonate, 0.5 for amlodipine impurity A, and 1.0 for amlodipine. Amlodipine impurity A is 3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate.] Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the standard deviation for replicate injections is not more than 10.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a period of time that is about 3 times the retention time of amlodipine, and measure the peak responses. Calculate the percentage of each impurity in the portion of Amlodipine Besylate taken by the formula:

$$100(1/F)(C_S/C_T)(r_i/r_s)$$

in which  $F$  is the relative response factor, which is equal to 0.5 for amlodipine impurity A and to 1.0 for other impurities;  $C_S$  and  $C_T$  are the concentrations, in mg per mL, of amlodipine besylate in the *Standard solution* and the *Test solution*, respectively;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_s$  is the peak response for amlodipine besylate obtained from the *Standard solution*: not more than 0.3% of amlodipine impurity A is found, and not more than 0.3% of total other impurities is found. Disregard any peak less than 0.03%, and disregard any peak due to benzene sulfonate.

#### Assay—

**pH 3.0 Buffer**—Dissolve 7.0 mL of triethylamine in 800 mL of water. Adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ , and dilute with water to 1 L.

**Mobile phase**—Prepare a filtered and degassed mixture of pH 3.0 Buffer, methanol, and acetonitrile (50:35:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

**Assay preparation**—Transfer about 50 mg of Amlodipine Besylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 237-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of  $C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$  in the portion of Amlodipine Besylate taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which  $C_S$  and  $C_U$  are the concentrations, in mg per mL, of amlodipine besylate in the *Standard preparation* and the *Assay preparation*, respectively; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amlodipine Besylate Tablets

### DEFINITION

Amlodipine Besylate Tablets contain NLT 90% and NMT 110% of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ).

### IDENTIFICATION

#### • A. ULTRAVIOLET ABSORPTION (197U)

**Standard solution and Sample solution:** Prepare as directed in the test for *Dissolution*.

**Acceptance criteria:** Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** Add 7.0 mL of triethylamine into a 1000-mL flask containing 900 mL of water. Adjust the solution with phosphoric acid to a pH of  $3.0 \pm 0.1$ . Dilute with water to volume, and mix well.

**Mobile phase:** Methanol, acetonitrile, and Buffer (35:15:50)

**Standard solution:** 0.0275 mg/mL of USP Amlodipine Besylate RS and 0.0025 mg/mL of USP Amlodipine Related Compound A RS in *Mobile phase*

**Sample solution:** Nominally 0.02 mg/mL of amlodipine in *Mobile phase* prepared as follows. Place NLT 5 Tablets in a suitable volumetric flask, and add sufficient quantity of *Mobile phase* to disintegrate the Tablets. Shake for 30 min, and dilute with *Mobile phase* to volume. Pass the sample through a syringe tip filter of 0.45- $\mu$ m pore size. Discard the first few mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 237 nm  
 Column: 3.9-mm × 15-cm; 5-μm packing L1  
 Flow rate: 1 mL/min  
 Injection volume: 50 μL

Run time: NLT 3 times the retention of the amlodipine peak

#### System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for amlodipine and amlodipine related compound A are about 1.0 and 0.5 respectively.]

#### Suitability requirements

Resolution: NLT 8.5 between amlodipine and amlodipine related compound A

Tailing factor: NMT 2.0 for both amlodipine and amlodipine related compound A

Relative standard deviation: NMT 5.0% for amlodipine related compound A

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of amlodipine, 408.88

$M_{r2}$  = molecular weight of amlodipine besylate, 567.05

Acceptance criteria: 90%–110% of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ )

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

[NOTE—Do not expose any of the solutions to stainless steel because of the degradation of amlodipine.]

Medium: 0.01 N hydrochloric acid; 500 mL

Apparatus 2: 75 rpm. [NOTE—Use paddles covered with Teflon or made of any inert material except stainless steel.]

Time: 30 min

Standard solution: Make appropriate dilutions of USP Amlodipine Besylate RS in *Medium* to obtain the following concentrations: 0.00695 mg/mL for Tablets labeled to contain 2.5 mg, 0.0139 mg/mL for Tablets labeled to contain 5 mg, and 0.0278 mg/mL for Tablets labeled to contain 10 mg. These solutions are stable for 1 day.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

#### Analysis

Samples: *Standard solution* and *Sample solution*

Determine the amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) dissolved by using UV absorption at the wavelength of maximum absorbance at about 239 nm on portions of the *Sample solution* in comparison with the *Standard solution*, using a 1-cm quartz cell and the *Medium* as the blank.

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times (M_{r1}/M_{r2}) \times V \times (1/L) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$D$  = dilution factor of the *Sample solution*

$M_{r1}$  = molecular weight of amlodipine, 408.88

$M_{r2}$  = molecular weight of amlodipine besylate, 567.05

$V$  = volume of *Medium*, 500 mL

$L$  = label claim (mg/Tablet)

Tolerances: NLT 75% ( $Q$ ) of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

Buffer, Mobile phase, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Sample solution: Place a suitable number of Tablets into a 25-mL volumetric flask to obtain a solution with a final nominal concentration of 0.4 mg/mL of amlodipine. Add about 10 mL of *Mobile phase* to the flask. Swirl to disintegrate the Tablets, then sonicate for 5 min to completely dissolve, and cool the sample to room temperature. Dilute with *Mobile phase* to volume. Stir for an additional 15 min using a magnetic stir bar, and pass the sample through a syringe tip filter of 0.45-μm pore size, discarding the first 5 mL.

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of amlodipine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of amlodipine related compound A from the *Sample solution*

$r_S$  = peak response of amlodipine related compound A from the *Standard solution*

$C_S$  = concentration of USP Amlodipine Related Compound A RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of amlodipine related compound A, 406.86

$M_{r2}$  = molecular weight of amlodipine related compound A fumarate, 522.93

Calculate the percentage of amlodipine glucose/galactose adduct or amlodipine lactose adduct, if present, and any unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of the amlodipine glucose/galactose adduct, amlodipine lactose adduct, or any unspecified degradation product from the *Sample solution*

$r_S$  = peak response of amlodipine from the *Standard solution*

$C_S$  = concentration of USP Amlodipine Besylate RS from the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of amlodipine, 408.9

$M_{r2}$  = molecular weight of amlodipine besylate, 567.05

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Amlodipine related compound A <sup>a</sup>	0.50	1.0
Amlodipine lactose adduct <sup>b</sup>	0.80	0.5
Amlodipine glucose/galactose adduct <sup>b</sup>	0.90	0.5
Amlodipine besylate	1.0	—
Any unspecified degradation product	—	0.2

<sup>a</sup> 3-Ethyl, 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate] fumarate.

<sup>b</sup> Formulation-specific impurities.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Amlodipine Besylate RS  
USP Amlodipine Related Compound A RS  
3-Ethyl, 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate] fumarate.  
 $C_{20}H_{23}ClN_2O_5 \cdot C_4H_4O_4$  522.93

## Aromatic Ammonia Spirit

### DEFINITION

Aromatic Ammonia Spirit is a hydroalcoholic solution that contains, in each 100 mL, NLT 1.7 g and NMT 2.1 g of total ammonia (NH<sub>3</sub>) and Ammonium Carbonate corresponding to NLT 3.5 g and NMT 4.5 g of ammonium carbonate [(NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>].

### ASSAY

#### • TOTAL AMMONIA (NH<sub>3</sub>)

Sample: 10.0 mL

Titrimetric system

(See *Titrimetry* (541), *Residual Titrations*.)

Mode: Residual titration

Titrant: 0.5 N sodium hydroxide VS

**Analysis:** Transfer the *Sample* to a 250-mL conical flask containing 50 mL of water. Add 30.0 mL of 0.5 N sulfuric acid VS, and boil until the solution becomes clear. Cool, add methyl red TS, and titrate the excess acid with *Titrant*. Perform a blank determination. Each mL of 0.5 N sulfuric acid is equivalent to 8.515 mg of ammonia (NH<sub>3</sub>).

#### • AMMONIUM CARBONATE

Sample: 10.0 mL

Titrimetric system

(See *Titrimetry* (541), *Residual Titrations*.)

Mode: Residual titration

Titrant: 0.5 N sulfuric acid VS

**Analysis:** Transfer the *Sample* to a 300-mL flask. Add 30 mL of 0.5 N sodium hydroxide, and boil the mixture, replacing the water lost by evaporation, until the vapors no longer turn moistened red litmus paper blue. Cool, dilute with 100 mL of cold, carbon dioxide-free water, add 6 drops of phenolphthalein TS, then add just enough 0.5 N sulfuric acid VS to discharge the color of the phenolphthalein. Add methyl orange TS, and titrate with *Titrant*. Perform a blank determination. Each mL of *Titrant* consumed in the titration with methyl orange TS

is equivalent to 48.04 mg of ammonium carbonate [(NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>].

**Acceptance criteria:** In each 100 mL, NLT 1.7 g and NMT 2.1 g of total ammonia (NH<sub>3</sub>) and Ammonium Carbonate corresponding to NLT 3.5 g and NMT 4.5 g of ammonium carbonate [(NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>].

### OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I (611):** 62.0%–68.0%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at a temperature not exceeding 30°.

## Ammonium Chloride

NH<sub>4</sub>Cl 53.49

Ammonium chloride.

Ammonium chloride [12125-02-9].

» Ammonium Chloride contains not less than 99.5 percent and not more than 100.5 percent of NH<sub>4</sub>Cl, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Identification**—A solution (1 in 10) responds to the tests for Ammonium (191) and for Chloride (191).

**pH** (791): between 4.6 and 6.0, in a solution (1 in 20).

**Loss on drying** (731)—Dry it over silica gel for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281)—Add 1 mL of sulfuric acid to about 2 g, accurately weighed, and heat the mixture gently until volatilization is complete: the residue is white, and when ignited, not more than 0.1% of nonvolatile substance remains.

**Limit of thiocyanate**—Acidify 10 mL of a solution (1 in 10) with hydrochloric acid, and add a few drops of ferric chloride TS: no orange-red color is produced.

### Delete the following:

• **Heavy metals, Method I (231):** 0.001%. • (Official 1-Jan-2018)

**Assay**—Transfer about 100 mg of Ammonium Chloride, accurately weighed, to a conical flask, add 10 mL of water, and swirl to dissolve. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.349 mg of NH<sub>4</sub>Cl.

## Ammonium Chloride Injection

» Ammonium Chloride Injection is a sterile solution of Ammonium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of NH<sub>4</sub>Cl. Hydrochloric acid may be added to adjust the pH.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.

**Labeling**—The label states the content of ammonium chloride in terms of weight and of milliequivalents in a given volume. The label states also the total osmolar concentration in mOsmol per L or per mL. The label states that the

Injection is not for direct injection but is to be diluted with Sodium Chloride Injection to the appropriate strength before use.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Identification**—It responds to the tests for *Ammonium* (191) and for *Chloride* (191).

**Bacterial Endotoxins Test** (85)—It contains not more than 1.72 USP Endotoxin Units per mEq of chloride.

**pH** (791): between 4.0 and 6.0, in a concentration of not more than 100 mg of ammonium chloride per mL.

**Particulate Matter in Injections** (788): meets the requirements for small-volume injections.

**Chloride content**—Transfer an accurately measured volume of Injection, evaporated, if necessary, equivalent to about 2 g of ammonium chloride, to a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a conical flask, add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. The content of Cl is between 63.0% and 70.3% of the labeled amount of ammonium chloride.

**Other requirements**—It meets the requirements under *Injections and Implanted Drug Products* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 200 mg of ammonium chloride, to a 500-mL Kjeldahl flask, dilute with water to 200 mL, mix, and add 50 mL of sodium hydroxide solution (2 in 5). Immediately connect the flask by means of a distillation trap to a well-cooled condenser, the delivery tube of which dips into 40 mL of boric acid solution (1 in 25) contained in a suitable receiver. Heat to boiling, and distill about 200 mL. Cool the liquid in the receiver, if necessary, then add methyl red TS, and titrate with 0.1 N sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sulfuric acid is equivalent to 5.349 mg of  $\text{NH}_4\text{Cl}$ .

## Ammonium Chloride Delayed-Release Tablets

» Ammonium Chloride Delayed-Release Tablets contain not less than 94.0 percent and not more than 106.0 percent of the labeled amount of  $\text{NH}_4\text{Cl}$ . Ammonium Chloride Delayed-Release Tablets are enteric-coated.

**Packaging and storage**—Preserve in tight containers.

**Identification**—A filtered solution of finely powdered Tablets, equivalent to ammonium chloride solution (1 in 10), responds to the tests for *Ammonium* (191) and for *Chloride* (191).

**Disintegration** (701): 2 hours, determined as directed for *Enteric-Coated Tablets*.

**Limit of thiocyanate**—Powder and dissolve in water a sufficient number of Tablets to make about 25 mL of ammonium chloride solution (1 in 10), and filter. Acidify 10 mL of the solution with hydrochloric acid, and add a few drops of ferric chloride TS: no reddish orange color is produced.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of ammonium chloride, to a 500-mL Kjeldahl flask, and add 200 mL of water and 50 mL of sodium hydroxide solution (2 in 5). Immediately connect the flask by means of a distillation trap to a well-cooled condenser, the delivery tube of which dips into 40 mL of

boric acid solution (1 in 25) contained in a suitable receiver. Heat to boiling, and distill about 200 mL. Cool the liquid in the receiver, if necessary, then add methyl red TS, and titrate with 0.1 N sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sulfuric acid is equivalent to 5.349 mg of  $\text{NH}_4\text{Cl}$ .

## Ferric Ammonium Citrate

» Ferric Ammonium Citrate contains not less than 16.5 percent and not more than 18.5 percent of iron (Fe).

**Packaging and storage**—Preserve in tight, light-resistant containers, in a cool place.

**Identification**—

A: Ignite about 0.5 g: it chars, and leaves a residue of iron oxide.

B: To 10 mL of a solution of Ferric Ammonium Citrate (1 in 100) add 6 N ammonium hydroxide dropwise: the solution darkens, but no precipitate forms.

C: To 5 mL of a solution of Ferric Ammonium Citrate (1 in 100) add 0.3 mL of potassium permanganate TS and 4 mL of mercuric sulfate TS, and heat the mixture to boiling: a white precipitate forms.

**Ferric citrate**—To a solution of Ferric Ammonium Citrate (1 in 100) add potassium ferrocyanide TS: no blue precipitate is formed.

**Sulfate** (221)—Dissolve 100 mg in 1 mL of 2.7 N hydrochloric acid, and dilute with water to 30 mL. Add 3 mL of barium chloride TS, dilute with water to 50 mL, and mix: any turbidity formed after 10 minutes is not greater than that produced in a similarly treated control solution containing 0.31 mL of 0.020 N sulfuric acid (0.3%).

**Oxalate**—Transfer 1 g to a 125-mL separator, dissolve in 10 mL of water, add 2 mL of hydrochloric acid, and extract successively with one 50-mL portion and one 20-mL portion of ether. Transfer the combined ether extracts to a 150-mL beaker, add 10 mL of water, and remove the ether by evaporation on a steam bath. Add 1 drop of glacial acetic acid and 1 mL of calcium acetate solution (1 in 20): no turbidity is produced within 5 minutes.

**Mercury**—

*Mercury Stock Solution and Standard Mercury Solution*—Proceed as directed for *Method I* under *Mercury* (261).

*Mercury Detection Instrument, Aeration Apparatus, and Stannous Chloride Solution*—Proceed as directed for *Method IIa* and *Method IIb* under *Mercury* (261).

**Standard solutions**—Transfer 0.25, 0.50, 1.0, and 3.5 mL of *Standard Mercury Solution* to four separate glass-stoppered bottles, such as biological oxygen-demand bottles, of about 300-mL capacity. Dilute the contents of each bottle with water to 100 mL, and mix. These solutions contain the equivalent of 2.5, 5.0, 10.0, and 35.0 ng of mercury per mL, respectively.

**Test solution**—Transfer about 1.000 g of Ferric Ammonium Citrate, accurately weighed, to a 200-mL centrifuge bottle with a polytetrafluoroethylene-lined screw cap, and add 5 mL of nitric acid and 5 mL of hydrochloric acid. Close the bottle tightly, digest on a steam bath for 1 hour, and cool. Quantitatively transfer the solution to a suitable glass-stoppered bottle, dilute with water to 100 mL, and bubble air through the solution for 2 minutes. Prepare a reagent blank in the same manner.

**Procedure**—Add 5 mL of *Stannous Chloride Solution* to each solution, and immediately insert the bubbler of the *Aeration Apparatus*. Obtain the absorbances as directed by the instrument manufacturer's operating instructions. Per-

form a blank determination, and make any necessary correction. Plot the absorbances of the *Standard solutions* versus concentrations, in  $\mu\text{g}$  per mL, of mercury, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, in  $\mu\text{g}$  per g, of mercury in the *Test solution*: not more than 10  $\mu\text{g}$  per g is found.

#### Limit of lead—

**Standard stock solution**—Dissolve about 159.8 mg of lead nitrate, accurately weighed, in 100 mL of water containing 1 mL of nitric acid. Dilute with water to 1000.0 mL, and mix.

**Standard solution**—[NOTE—Prepare this solution on the day of use.] Transfer 10.0 mL of *Standard stock solution* to a 500-mL volumetric flask, dilute with water to volume, and mix. Each mL contains the equivalent of 2  $\mu\text{g}$  of lead (Pb).

**Test solution**—Transfer about 15 g of Ferric Ammonium Citrate, accurately weighed, to a 100-mL volumetric flask (previously rinsed with nitric acid and water), dissolve in a mixture of 50 mL of water and 1 mL of nitric acid, dilute with water to volume, and mix.

**Procedure**—Using a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a deuterium arc background corrector, a digital readout device, and a burner head capable of handling 15% solids content, perform a blank determination with water, following the manufacturer's operating instructions. Separately aspirate portions of the *Standard solution* and the *Test solution*, and record the absorbances. Calculate the lead content, in  $\mu\text{g}$  per g, in the portion of Ferric Ammonium Citrate taken by the formula:

$$100(C/W)(A_U/A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of lead in the *Standard solution*; W is the weight, in g, of Ferric Ammonium Citrate taken; and  $A_U$  and  $A_S$  are the absorbances of the *Test solution* and the *Standard solution*, respectively: not more than 10  $\mu\text{g}$  per g is found.

**Assay**—Transfer about 1 g of Ferric Ammonium Citrate, accurately weighed, to a 250-mL conical flask, and dissolve in 25 mL of water and 5 mL of hydrochloric acid. Add 4 g of potassium iodide, insert the stopper, and allow to stand protected from light for 15 minutes. Add 100 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.585 mg of iron (Fe).

### Ferric Ammonium Citrate for Oral Solution

» Ferric Ammonium Citrate for Oral Solution contains Ferric Ammonium Citrate and an effervescent mixture of a suitable organic acid and an alkali metal bicarbonate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Fe. It may contain one or more suitable flavors, colors, or stabilizing agents.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store in a cool place.

**Identification**—A 6-g portion dissolves in 600 mL of water with effervescence. The collected gas meets the requirements of the test for *Bicarbonate* (191), and the resulting solution meets the requirements of the tests for *Iron* (191) and for *Citrate* (191).

#### Uniformity of dosage units (905)—

FOR POWDER PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

#### Deliverable volume (698)—

FOR POWDER PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Assay**—Transfer about 6 g of Ferric Ammonium Citrate for Oral Solution, accurately weighed, to a 250-mL conical flask, and dissolve in 100 mL of water. Allow the gas to escape, add 5 mL of hydrochloric acid and 4 g of potassium iodide, insert the stopper, and allow to stand protected from light for 15 minutes. Add 25 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.585 mg of Fe.

### Ammonium Molybdate

$(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$  1236.00  
Molybdate ( $\text{Mo}_7\text{O}_{24}^{6-}$ ), hexaammonium, tetrahydrate;  
Hexaammonium molybdate tetrahydrate [12054-85-2].

#### DEFINITION

Ammonium Molybdate contains NLT 99.3% and NMT 101.8% of  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$ .

#### IDENTIFICATION

##### • PROCEDURE

**Sample:** 0.6 g

**Analysis:** Dissolve the *Sample* in 1.4 mL of water and 1.45 mL of ammonium hydroxide. Cool this mixture, and add slowly, with mixing, 7.2 mL of a well-cooled mixture of 3.2 mL of nitric acid and 4 mL of water. Allow to stand for 24–48 h, and pass through a sintered-glass filter. To 5 mL of the filtrate add 2 mL of dibasic sodium phosphate TS.

**Acceptance criteria:** A yellow precipitate is formed, and it is soluble in an excess of 6 N ammonium hydroxide.

#### ASSAY

##### • PROCEDURE

**Sample solution:** Dissolve 0.7 g of Ammonium Molybdate in 100 mL water. Adjust with dilute nitric acid to a pH of 4.0. Add saturated hexamethylenetetramine solution to achieve a pH of 5–6.

**Analysis:** Heat the *Sample solution* to 60°, and add 0.2 mL of 0.1% 4-[2-pyridylazo]resorcinol solution in alcohol. Titrate with 0.1 M lead nitrate VS from the yellow color to the first permanent pink endpoint. Carry out a blank titration. Each mL of 0.1 M lead nitrate is equivalent to 17.66 mg of  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$ .

**Acceptance criteria:** 99.3%–101.8%

#### IMPURITIES

##### Inorganic Impurities

##### • ARSENATE, PHOSPHATE, AND SILICATE

**Sample solution:** Dissolve 2.5 g of the analyte in 70 mL of water in a container other than glass.

**Control solution:** Dissolve 0.5 g of the analyte in 70 mL of water in a container other than glass, and add an amount of sodium silicate solution equivalent to 0.02 mg of silica ( $\text{SiO}_2$ ).

##### Analysis

**Samples:** *Sample solution* and *Control solution*

Adjust with 1.2 N hydrochloric acid to a pH of between 3 and 4, transfer to a glass container, add 2 mL of bromine TS, and adjust with 1.2 N hydrochloric acid to a pH of  $1.8 \pm 0.1$ . Heat almost to boiling, and cool to room temperature. Dilute with

water to 90 mL, add 10 mL of hydrochloric acid, and transfer to a separator. Add 1 mL of butyl alcohol and 30 mL of 4-methyl-2-pentanone, shake vigorously, and allow the phases to separate. Discard the aqueous phase, and wash the ketone phase with three successive 10-mL portions of 1.2 N hydrochloric acid, discarding the washings. To the washed ketone phase add 10 mL of 1.2 N hydrochloric acid to which has just been added 0.2 mL of a freshly prepared solution (1 in 50) of stannous chloride in hydrochloric acid.

**Acceptance criteria:** Any blue color in the *Sample solution* does not exceed that in the *Control solution* (NMT 10 ppm).

- **CHLORIDE AND SULFATE, Chloride** (221): A 0.5-g portion shows no more chloride than 0.30 mL of 0.001 N hydrochloric acid (NMT 20 ppm).
- **CHLORIDE AND SULFATE, Sulfate** (221): A 0.25-g portion shows no more sulfate than corresponds to 1.0 mL of 0.001 N sulfuric acid (NMT 200 ppm).

#### Delete the following:

#### • HEAVY METALS (231)

**Sample stock solution:** Dissolve 2.0 g of Ammonium Molybdate in 20 mL of water, add 10 mL of 2.5 N sodium hydroxide and 2 mL of ammonium hydroxide, and dilute with water to 40 mL.

**Control solution:** To 10 mL of *Sample stock solution* add 1.0 mL of *Standard Lead Solution*, prepared as directed under *Heavy Metals* (231), and dilute with water to 40 mL.

**Sample solution:** Dilute the remaining 30-mL portion of the *Sample stock solution* with water to 40 mL.

**Analysis:** To both the *Sample solution* and the *Control solution* add 1.2 mL of thioacetamide–glycerin base TS and 2 mL of pH 3.5 Acetate Buffer, and allow to stand for 5 min.

**Acceptance criteria:** Any color in the *Sample solution* does not exceed that in the *Control solution* (NMT 10 ppm). • (Official 1-Jan-2018)

#### • INSOLUBLE SUBSTANCES

**Sample:** 20 g

**Analysis:** Dissolve the *Sample* in 200 mL of water in a beaker, heat to boiling, cover, and heat on a steam bath for 1 h. Pass the hot solution through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° for 2 h.

**Acceptance criteria:** The weight of the residue is NMT 1 mg (0.005%).

#### • NITRATE

**Sample:** 1 g

**Analysis:** Dissolve the *Sample* in 10 mL of water containing 5 mg of sodium chloride, and add 0.10 mL of a solution (1 in 1000) of indigo carmine in 3.6 N sulfuric acid.

**Acceptance criteria:** The blue color is not completely discharged in 5 min.

#### • MAGNESIUM AND ALKALI SALTS

**Sample:** 5.0 g

**Analysis:** Dissolve the *Sample* in 50 mL of water, and filter. To the filtrate add 0.5 g of sodium carbonate and 25 mL of 2.5 N sodium hydroxide. Boil the solution gently for 5 min, cool, and pass through an ignited and tared filter. Wash the filter with 1 N ammonium hydroxide. Ignite the filter at 800 ± 25° for 30 min.

**Acceptance criteria:** The weight of the residue does not exceed 1 mg (NMT 0.02%).

#### • PHOSPHATE

**Standard solution:** Dissolve 143.3 mg of dried monobasic potassium phosphate in water to make 1000 mL, and then dilute 1.0 mL of this solution with 3 N ammonium hydroxide to 100 mL.

**Sample solution:** Dissolve 20 g of the analyte in 100 mL of 3 N ammonium hydroxide.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Add 3.5 mL of ferric nitrate solution (1 in 10), and allow to stand for 15 min. Warm gently to coagulate the precipitate, and filter. Wash the filter several times with 1.5 N ammonium hydroxide, then wash the filter with 60 mL of warm 4 N nitric acid to dissolve the residue on the filter, collecting the filtrate in a glass-stoppered, 250-mL conical flask. Add 13 mL of ammonium hydroxide, warm to 40°, add 50 mL of ammonium molybdate TS, shake for 5 min, and allow to stand at 40° for 2 h.

**Acceptance criteria:** Any yellow precipitate formed from the *Sample solution* does not exceed that from the *Standard solution* (5 ppm).

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

### Ammonium Molybdate Injection

» Ammonium Molybdate Injection is a sterile solution of Ammonium Molybdate in Water for Injection. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of molybdenum (Mo).

**Packaging and storage—**Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.

**Labeling—**Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid prior to administration.

#### Identification—

**A:** The *Assay preparation*, prepared as directed in the *Assay*, exhibits an absorption maximum at about 313 nm when tested as directed for *Procedure* in the *Assay*.

**B:** Add 0.3 mL of alkaline mercuric-potassium iodide TS to 5 mL of Injection: a reddish-brown color develops.

**C:** Evaporate 50 mL of Injection on a steam bath to a volume of about 0.3 mL, and add 0.3 mL of ammonium hydroxide. Cool, and add slowly, with mixing, a well-cooled mixture of 1 mL of nitric acid and 1.2 mL of water. Allow to stand for 24 to 48 hours, and pass through a sintered-glass filter. To the filtrate add 0.5 mL of dibasic sodium phosphate TS: a yellow precipitate is formed, and it dissolves in an excess of 6 N ammonium hydroxide.

**Pyrogen** (151)—It meets the requirements, the test dose being 10 mL of Injection per kg.

**pH** (791): between 3.0 and 6.0.

**Particulate Matter in Injections** (788): meets the requirements for small-volume injections.

**Other requirements—**It meets the requirements under *Injections and Implanted Drug Products* (1).

#### Assay—

**Ammonium hydroxide diluent—**Dilute 40 mL of ammonium hydroxide with water to 1000 mL. Store in a plastic bottle.

**Sodium sulfate solution—**Dissolve 1 g of sodium sulfate in water to make 100 mL.

**Molybdenum stock solution—**Transfer about 1.84 g of previously assayed Ammonium Molybdate, accurately weighed, to a 1000-mL volumetric flask, dilute with *Ammonium hydroxide diluent* to volume, and mix. This solution contains the equivalent of 1000 µg of molybdenum per mL.

**Standard preparations**—Transfer 0, 1.0, 2.0, 3.0, and 4.0 mL, respectively, of Molybdenum stock solution to separate 100-mL volumetric flasks, and to the respective flasks add 5.0, 4.0, 3.0, 2.0, and 1.0 mL of Ammonium hydroxide diluent. To each flask add 10 mL of Sodium sulfate solution, dilute with water to volume, and mix. These Standard preparations contain, respectively, 0, 10, 20, 30, and 40 µg of molybdenum per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 500 µg of molybdenum, to a 25-mL volumetric flask, add 1.25 mL of Ammonium hydroxide diluent and 2.5 mL of Sodium sulfate solution, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the Standard preparations and the Assay preparation at the molybdenum emission line of 313.3 nm with a suitable atomic absorption spectrophotometer (see Atomic Absorption Spectroscopy (852)) equipped with a molybdenum hollow-cathode lamp and a nitrous oxide-acetylene reducing flame, using water as the blank. Plot the absorbances of the Standard preparations versus concentration, in µg per mL, of molybdenum, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, in µg per mL, of molybdenum in the Assay preparation. Calculate the quantity, in µg, of molybdenum (Mo) in each mL of the Injection taken by the formula:

$$25C/V$$

in which C is the concentration, in µg per mL, of molybdenum in the Assay preparation; and V is the volume, in mL, of Injection taken.

## Amobarbital Sodium

$C_{11}H_{17}N_2NaO_3$  248.25  
2,4,6-(1H,3H,5H)-Pyrimidinetrione, 5-ethyl-5-(3-methylbutyl)-, monosodium salt.  
Sodium 5-ethyl-5-isopentylbarbiturate [64-43-7].

» Amobarbital Sodium contains not less than 98.5 percent and not more than 100.5 percent of  $C_{11}H_{17}N_2NaO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

### USP Reference standards (11)—

USP Amobarbital RS  
USP Endotoxin RS

**Completeness of solution** (641)—Mix 1.0 g with 10 mL of carbon dioxide-free water; after 1 minute, the solution is clear and free from undissolved solid.

### Identification—

**A: Infrared Absorption** (197K): of residue obtained in the Assay.

**B:** Ignite about 200 mg; the residue effervesces with acid and responds to the tests for Sodium (191).

**pH** (791): not more than 11.0, in the solution prepared for the test for Completeness of solution.

**Loss on drying** (731)—Dry about 1 g, accurately weighed, at 105° for 4 hours; it loses not more than 2.0% of its weight.

### Delete the following:

• **Heavy metals, Method II** (231): 0.003%. • (Official 1-Jan-2018)

**Other requirements**—Where the label states that Amobarbital Sodium is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Amobarbital Sodium for Injection. Where the label states that Amobarbital Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Amobarbital Sodium for Injection.

**Assay**—Dissolve about 500 mg of Amobarbital Sodium, accurately weighed, in about 15 mL of water in a separator. To the solution add 2 mL of hydrochloric acid, shake, and completely extract the liberated amobarbital with 25-mL portions of chloroform. Test for completeness of extraction by extracting with an additional 10-mL portion of chloroform and evaporating the solvent: not more than 0.5 mg of residue remains. Filter the combined extract through a glass filter funnel into a tared beaker, and wash the separator and the filter with several small portions of chloroform. Evaporate the combined filtrate and washings on a steam bath with the aid of a current of air, dry the residue at 105° for 30 minutes, cool, and weigh. The weight of the residue, multiplied by 1.097, represents the weight of  $C_{11}H_{17}N_2NaO_3$ .

## Amobarbital Sodium for Injection

### DEFINITION

Amobarbital Sodium for Injection is Amobarbital Sodium suitable for parenteral use. It contains NLT 98.5% and NMT 100.5% of the labeled amount of amobarbital sodium ( $C_{11}H_{17}N_2NaO_3$ ), calculated on the dried basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Sample:** Residue obtained in the Assay

**Acceptance criteria:** Meets the requirements

#### • B. IDENTIFICATION TESTS—GENERAL, Sodium (191)

**Sample:** Nominally 200 mg of amobarbital sodium from Amobarbital Sodium for Injection

**Analysis:** Ignite the Sample.

**Acceptance criteria:** The residue effervesces with acid and meets the requirements of the tests.

### ASSAY

#### • PROCEDURE

**Sample solution:** Transfer nominally 500 mg of amobarbital sodium from Amobarbital Sodium for Injection to a suitable separator, and dissolve in 15 mL of water. Add 2 mL of hydrochloric acid, and shake. Completely extract the amobarbital with 25-mL portions of chloroform. Combine the chloroform extractions, and pass through a glass filter funnel into a tared beaker. Wash the separator and the filter with several small portions of chloroform. Use the combined chloroform extractions and the washings.

**Test for completeness of extraction:** Extract the remaining solution in the separator with an additional 10-mL portion of chloroform, and evaporate the solvent; NMT 0.5 mg of residue remains.

**Analysis:** Evaporate the Sample solution on a steam bath with the aid of a current of air. Dry the residue at 105° for 30 min, cool, and weigh.

Calculate the percentage of the labeled amount of amobarbital sodium ( $C_{11}H_{17}N_2NaO_3$ ) in the portion of Amobarbital Sodium for Injection taken:

$$\text{Result} = (W_R/W_S) \times (M_{r1}/M_{r2}) \times 100$$

- $W_R$  = weight of the residue from the *Analysis* (mg)  
 $W_S$  = nominal weight of amobarbital sodium in the *Sample solution* (mg)  
 $M_{r1}$  = molecular weight of amobarbital sodium, 248.25  
 $M_{r2}$  = molecular weight of amobarbital, 226.27  
 Acceptance criteria: 98.5%–100.5% on the dried basis

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

**IMPURITIES**

Delete the following:

**Amodiaquine**

$C_{20}H_{22}ClN_3O$  355.86  
 Phenol, 4-[(7-chloro-4-quinolyl)amino]-2-[(diethylamino)methyl]-;  
 4-[(7-Chloro-4-quinolyl)amino]- $\alpha$ -(diethylamino)-o-cresol [86-42-0].

**DEFINITION**

Amodiaquine contains NLT 97.0% and NMT 103.0% of amodiaquine ( $C_{20}H_{22}ClN_3O$ ), calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**  
*Standard:* Dissolve 20 mg of USP Amodiaquine Hydrochloride RS in 10 mL of water in a separator, add 1 mL of ammonium hydroxide, and extract by shaking with 25 mL of chloroform. Draw off and evaporate the chloroform extract, and dry the residue at 105° for 2 h.  
*Acceptance criteria:* Meets the requirements
- **B. ULTRAVIOLET ABSORPTION (197U)**  
*Sample solution:* 10  $\mu$ g/mL in 0.1 N hydrochloric acid  
*Acceptance criteria:* Meets the requirements

**ASSAY**

- **PROCEDURE**  
*Standard solution:* 15  $\mu$ g/mL of USP Amodiaquine Hydrochloride RS in 0.1 N hydrochloric acid  
*Sample solution:* 15  $\mu$ g/mL of Amodiaquine in 0.1 N hydrochloric acid  
**Instrumental conditions**  
*(See Ultraviolet-Visible Spectroscopy (857).)*  
**Mode:** UV  
**Analytical wavelength:** 342 nm  
**Cell:** 1 cm  
**Blank:** 0.1 N hydrochloric acid  
**Analysis**  
*Samples:* *Standard solution* and *Sample solution*  
 Calculate the percentage of amodiaquine ( $C_{20}H_{22}ClN_3O$ ) in the portion of Amodiaquine taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of USP Amodiaquine Hydrochloride RS in the *Standard solution* ( $\mu$ g/mL)  
 $C_U$  = concentration of Amodiaquine in the *Sample solution* ( $\mu$ g/mL)  
 $M_{r1}$  = molecular weight of amodiaquine, 355.86  
 $M_{r2}$  = molecular weight of anhydrous aminodiaquine hydrochloride, 428.79  
**Acceptance criteria:** 97.0%–103.0% on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION (281):** NMT 0.2%
- **ORGANIC IMPURITIES**  
*Standard solution A:* To 20 mg of USP Amodiaquine Hydrochloride RS in a glass-stoppered test tube add 1.0 mL of chloroform (saturated with ammonium hydroxide), and shake vigorously for 2 min. Allow the solids to settle, and decant the liquid into a second test tube.  
*Standard solution B:* *Standard solution A* and chloroform (saturated with ammonium hydroxide) (1 in 200)  
*Sample solution:* 15 mg/mL of Amodiaquine in chloroform (saturated with ammonium hydroxide)  
**Chromatographic system**  
*(See Chromatography (621), Thin-Layer Chromatography.)*  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture  
**Application volume:** 10  $\mu$ L  
**Developing solvent system:** Chloroform (saturated with ammonium hydroxide) and dehydrated alcohol (9:1)  
**Analysis**  
*Samples:* *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the solvent to evaporate, and examine the plate under short-wavelength UV light.

**Acceptance criteria:** The chromatograms show principal spots at about the same  $R_f$  value; and no secondary spot, if present in the chromatogram from the *Sample solution*, is more intense than the principal spot obtained from *Standard solution B*.

- **ORGANIC IMPURITIES**

**Buffer, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Amodiaquine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = response of each impurity from the *Sample solution*

$r_T$  = sum of the responses from the *Sample solution*

**Acceptance criteria**

**Individual impurity:** NMT 0.5%

#### SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): 7.0%–9.0%
- **COMPLETENESS OF SOLUTION** (641): A solution of 200 mg in 10 mL of water is clear.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Amodiaquine Hydrochloride RS  
USP Chloroquine Phosphate RS

### Amodiaquine Hydrochloride Tablets

#### DEFINITION

Amodiaquine Hydrochloride Tablets contain an amount of amodiaquine hydrochloride ( $C_{20}H_{22}ClN_3O \cdot 2HCl \cdot 2H_2O$ )

equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of amodiaquine ( $C_{20}H_{22}ClN_3O$ ).

## IDENTIFICATION

### A. INFRARED ABSORPTION (197K)

**Sample:** Powder 1 or more Tablets, and transfer a portion of the powder, equivalent to 50 mg of amodiaquine, to a 125-mL separator. Add 20 mL of water, and shake for 1 min. Add 25 mL of chloroform and 1 mL of ammonium hydroxide, shake for 2 min, and when settled, filter the chloroform extract through cotton that previously has been rinsed with chloroform, collecting the extract in a vessel suitable for evaporation. Evaporate the chloroform, and dry the residue at 105° for 1 h.

**Acceptance criteria:** Meet the requirements

- B.** The retention time of the amodiaquine hydrochloride peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

## ASSAY

### PROCEDURE

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Add 1.0 mL of perchloric acid to each 1 L of solution, adjust with phosphoric acid to a pH of 2.5, and pass through a filter of 0.45-μm pore size.

**Diluent:** 1% (v/v) hydrochloric acid in water

**Mobile phase:** Methanol and *Buffer* (22:78)

**Standard solution:** 0.15 mg/mL of USP Amodiaquine Hydrochloride RS and 0.15 mg/mL of USP Chloroquine Phosphate RS in water

**Sample solution:** Transfer a quantity equivalent to 7.5 mg of amodiaquine hydrochloride from finely powdered Tablets (NLT 20) to a 50-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume. Sonicate for 25 min at 29°. Pass 10 mL through a nylon filter of 0.2-μm pore size, discarding the first 4 mL. Use 2 mL for the analysis.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 224 nm

**Column:** 4.6-mm × 10-cm; 5-μm packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 10 μL

### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for the chloroquine and amodiaquine peaks are 0.8 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 1.5 between amodiaquine hydrochloride and chloroquine phosphate

**Tailing factor:** NMT 1.5 for amodiaquine hydrochloride and chloroquine phosphate

**Relative standard deviation:** NMT 2.0% for amodiaquine hydrochloride and chloroquine phosphate

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of amodiaquine ( $C_{20}H_{22}ClN_3O$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$	= peak response from the <i>Sample solution</i>
$r_S$	= peak response from the <i>Standard solution</i>
$C_S$	= concentration of amodiaquine in USP Amodiaquine Hydrochloride RS in the <i>Standard solution</i> (mg/mL)
$C_U$	= nominal concentration of amodiaquine in the <i>Sample solution</i> (mg/mL)

**Acceptance criteria:** 93.0%–107.0%

## PERFORMANCE TESTS

### DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Detector:** UV 342 nm

**Standard solution:** USP Amodiaquine Hydrochloride RS in *Medium*

**Sample solution:** Filter portions of the solution under test, suitably diluted with water, if necessary, in comparison with a *Standard solution* having a known concentration of USP Amodiaquine Hydrochloride RS.

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Determine the amount of amodiaquine hydrochloride ( $C_{20}H_{22}ClN_3O \cdot 2HCl \cdot 2H_2O$ ) dissolved from UV absorbances.

**Tolerances:** An amount of amodiaquine hydrochloride ( $C_{20}H_{22}ClN_3O \cdot 2HCl \cdot 2H_2O$ ) equivalent to NLT 75% (Q) of the labeled amount of amodiaquine ( $C_{20}H_{22}ClN_3O$ ) is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.

### USP REFERENCE STANDARDS (11)

USP Amodiaquine Hydrochloride RS

USP Chloroquine Phosphate RS

## Amoxapine

$C_{17}H_{16}ClN_3O$  313.78  
Dibenz[b,f][1,4]oxazepine, 2-chloro-11-(1-piperazinyl)-;  
2-Chloro-11-(1-piperazinyl)dibenz[b,f][1,4]oxazepine  
[14028-44-5].

## DEFINITION

Amoxapine contains NLT 98.0% and NMT 102.0% of amoxapine ( $C_{17}H_{16}ClN_3O$ ), calculated on the dried basis.

## IDENTIFICATION

### A. INFRARED ABSORPTION (197K)

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

## ASSAY

### PROCEDURE

**Buffer:** 3.9 g/L of ammonium acetate in water adjusted with acetic acid or diluted ammonia solution to a pH of 7.3

**Mobile phase:** Acetonitrile and *Buffer* (30:70)

**Diluent:** Acetonitrile and *Buffer* (70:30)

**System suitability solution:** 0.1 mg/mL each of USP Amoxapine RS and USP Amoxapine Related Compound G RS in *Diluent*

**Standard solution:** 0.1 mg/mL of USP Amoxapine RS in *Diluent*

**Sample solution:** 0.1 mg/mL of Amoxapine in *Diluent*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 254 nm  
 Column: 4.6-mm × 7.5-cm; 2.5-μm or 2.7-μm packing L1  
 Column temperature: 35°  
 Flow rate: 1.2 mL/min  
 Injection volume: 10 μL

#### System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for amoxapine and amoxapine related compound G are 1.0 and 1.3, respectively.]

#### Suitability requirements

Resolution: NLT 1.5 between amoxapine and amoxapine related compound G, *System suitability solution*

Tailing factor: 0.8–1.8, *Standard solution*

Relative standard deviation: NMT 0.73%, *Standard solution*

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of amoxapine ( $C_{17}H_{16}ClN_3O$ ) in the portion of Amoxapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amoxapine from the *Sample solution*

$r_S$  = peak response of amoxapine from the *Standard solution*

$C_S$  = concentration of USP Amoxapine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amoxapine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

#### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **ORGANIC IMPURITIES**

**Solution A:** 3.9 g/L of ammonium acetate in water adjusted with acetic acid or diluted ammonia solution to a pH of 7.3

**Solution B:** Acetonitrile

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
5	70	30
7.5	60	40
15	60	40
20	20	80
25	20	80
30	70	30
35	70	30

**Diluent:** *Solution A* and *Solution B* (30:70)

**System suitability solution:** 1 mg/mL of USP Amoxapine RS and 1.5 μg/mL of USP Amoxapine Related Compound G RS in *Diluent*

**Standard solution:** 1 μg/mL of USP Amoxapine RS, and 1.5 μg/mL each of USP Amoxapine Related Compound G RS and USP Amoxapine Related Compound D RS in *Diluent*

**Sample solution:** 1000 μg/mL of Amoxapine in *Diluent*

#### Chromatographic system

Proceed as directed in the *Assay*.

#### System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

#### Suitability requirements

Peak-to-valley ratio: NLT 3 between amoxapine and amoxapine related compound G, *System suitability solution*

Relative standard deviation: NMT 5.0% each for amoxapine, amoxapine related compound G, and amoxapine related compound D, *Standard solution*

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of amoxapine related compound G and amoxapine related compound D in the portion of Amoxapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amoxapine related compound G or amoxapine related compound D from the *Sample solution*

$r_S$  = peak response of amoxapine related compound G or amoxapine related compound D from the *Standard solution*

$C_S$  = concentration of USP Amoxapine Related Compound G RS or USP Amoxapine Related Compound D RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of Amoxapine in the *Sample solution* (μg/mL)

Calculate the percentage of any other impurity in the portion of Amoxapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any other impurity from the *Sample solution*

$r_S$  = peak response of amoxapine from the *Standard solution*

$C_S$  = concentration of USP Amoxapine RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of Amoxapine in the *Sample solution* (μg/mL)

Acceptance criteria: See Table 2. Disregard peaks that are less than 0.02% of the amoxapine peak.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

3-Chloro-11-(piperazin-1-yl)dibenzo[b,f][1,4]oxazepine.

C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O 313.78

## Amoxapine Tablets

### DEFINITION

Amoxapine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of amoxapine (C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Sample:** Triturate a quantity of finely ground Tablets, equivalent to 50 mg of amoxapine, with 10 mL of chloroform, and filter. Evaporate the filtrate on a steam bath to dryness (about 30 min).

#### • B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** 1.38 g/L of monobasic sodium phosphate in water

**Solution B:** 113 g/L of tetramethylammonium chloride in water

**Mobile phase:** Transfer 20.0 mL of *Solution B*, 4.0 mL of dilute phosphoric acid (1 in 5), and 720 mL of acetonitrile to a 2000-mL volumetric flask. Dilute with *Solution A* to volume.

**Standard stock solution:** 1 mg/mL of USP Amoxapine RS in acetonitrile. Shake by mechanical means to dissolve, and then dilute with acetonitrile to volume.

**Standard solution:** 0.1 mg/mL from the *Standard stock solution* diluted with *Mobile phase*

**Sample stock solution:** Nominally 1 mg/mL of amoxapine from NLT 20 finely powdered Tablets prepared as follows. Transfer a suitable quantity of the powder to a volumetric flask. Add 80% of the flask volume of *Mobile phase*, and shake vigorously by mechanical means for 20 min. Dilute with *Mobile phase* to volume, and filter.

**Sample solution:** 0.1 mg/mL from the *Sample stock solution* diluted with *Mobile phase*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 µL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

Column efficiency: NLT 1200 theoretical plates

Tailing factor: NMT 1.8

Relative standard deviation: NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amoxapine (C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amoxapine from the *Sample solution*

$r_S$  = peak response of amoxapine from the *Standard solution*

$C_S$  = concentration of USP Amoxapine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amoxapine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

**Medium:** Simulated gastric fluid (without enzyme); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Sample solution:** Sample per *Dissolution* (711).

**Standard solution:** USP Amoxapine RS having a concentration similar to the expected *Sample solution* in *Medium*

### Instrumental conditions

Analytical wavelength: 294 nm

### Analysis

**Samples:** *Sample solution* and *Standard solution*

Determine the percentage of the labeled amount of amoxapine (C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O) dissolved from UV absorbances of filtered portions of the *Sample solution*, suitably diluted with *Medium*, if necessary.

Calculate the percentage of the labeled amount of amoxapine (C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$V$  = volume of the *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amount of amoxapine (C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in well-closed containers.

### • USP REFERENCE STANDARDS (11)

USP Amoxapine RS

## Amoxicillin

$C_{16}H_{19}N_3O_5S \cdot 3H_2O$  419.45  
 4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[amino(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-, trihydrate [2S-[2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ (S\*)]]-; (2S,5R,6R)-6-[(R)-(-)-2-Amino-2-(p-hydroxyphenyl)-acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate [61336-70-7].  
 Anhydrous 365.41  
 [26787-78-0].

### DEFINITION

Amoxicillin contains NLT 900  $\mu$ g and NMT 1050  $\mu$ g of  $C_{16}H_{19}N_3O_5S$  per mg, calculated on the anhydrous basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** (197K)

### ASSAY

- **PROCEDURE**

**Diluent:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Diluent* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Diluent*. [NOTE—Use this solution within 6 h.]

**Sample solution:** 1.2 mg/mL of Amoxicillin in *Diluent*. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in  $\mu$ g/mg, of  $C_{16}H_{19}N_3O_5S$  in the portion of Amoxicillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

**Acceptance criteria:** 900–1050  $\mu$ g of  $C_{16}H_{19}N_3O_5S$  per mg on the anhydrous basis

### IMPURITIES

#### Organic Impurities

- **PROCEDURE**

**Solution A:** 2.72 g/L of monobasic potassium phosphate. Adjust with 1 N potassium hydroxide or 20% phosphoric acid to a pH of  $5.0 \pm 0.1$ .

**Solution B:** Methanol

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	97	3
10	97	3
22	75	25
26	97	3

**Standard solution:** 12.5  $\mu$ g/mL of USP Amoxicillin RS in *Solution A*

**System suitability solution:** 12.5  $\mu$ g/mL each of USP Amoxicillin Related Compound A RS and USP Amoxicillin Related Compound D RS in *Solution A*

**Sample solution:** 1.25 mg/mL of Amoxicillin in *Solution A*. [NOTE—Store this solution at 4° and use within 4 h.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  10-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

**Autosampler temperature:** 4°

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

[NOTE—Identify peaks by the relative retention times in *Impurity Table 1*.]

**Resolution:** NLT 1.5 between amoxicillin related compound A and the second peak for amoxicillin related compound D, *System suitability solution*

**Relative standard deviation:** NMT 10%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Amoxicillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of amoxicillin from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of Amoxicillin in the *Sample solution* (mg/mL)

$F$  = unit conversion factor (0.001 mg/ $\mu$ g)

#### Acceptance criteria

[NOTE—The reporting limit is 0.03 times the amoxicillin peak from the *Standard solution*.]

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 5.0%

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Amoxicillin related compound Ia (D-hydroxyphenylglycine)	0.32	1.0
Amoxicillin related compound Db,c (amoxicillin open ring)	0.53	1.0
	0.68	1.0
Amoxicillin related compound Ad (6-aminopenicillanic acid)	0.78	0.5
Amoxicillin related compound Be,f (L-amoxicillin)	0.87	—
Amoxicillin	1.0	—
Amoxicillin related compound Gg (D-hydroxyphenylglycylamoxicillin)	2.9	1.0
Amoxicillin related compound Eh,i (amoxicillin penilloic derivative)	4.5	1.0
Amoxicillin related compound Mi (N-(penicillan-6-yl) open ring amoxicillinamide)	6.0	1.0
Amoxicillin related compound Fe,k (phenylpyrazinediol)	6.3	—
Amoxicillin related compound Cl (amoxicillin rearrangement product)	6.4	1.0
Amoxicillin related compound Eh,i (amoxicillin penilloic derivative)	6.7	1.0
Amoxicillin related compound Jm (amoxicillin open ring dimer)	8.8	1.0
Amoxicillin related compound Ln (N-(penicillan-6-yl) amoxicillinamide)	9.0	1.0
Any unspecified individual impurity	—	1.0

<sup>a</sup> (R)-2-Amino-2-(4-hydroxyphenyl)acetic acid.

<sup>b</sup> The chromatographic system resolves two penicilloic acids from each other.

<sup>c</sup> (4S)-2-[[[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido](carboxy)methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

<sup>d</sup> (2S,5R,6R)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]-heptane-2-carboxylic acid.

<sup>e</sup> These compounds are listed for information only and are not to be reported.

<sup>f</sup> (2S,5R,6R)-6-[(S)-2-Amino-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>g</sup> (2S,5R,6R)-6-[(R)-2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]-heptane-2-carboxylic acid.

<sup>h</sup> The chromatographic system resolves two penilloic acids from each other.

<sup>i</sup> (4S)-2-[[[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

<sup>j</sup> (2S,5R,6R)-6-[(2R)-2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-2-[(4S)-4-carboxy-5,5-dimethylthiazolidine-2-yl]acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>k</sup> 3-(4-Hydroxyphenyl)pyrazin-2-ol.

<sup>l</sup> (4S)-2-[5-(4-Hydroxyphenyl)-3,6-dioxopiperazin-2-yl]-5,5-dimethylthiazolidine-4-carboxylic acid.

<sup>m</sup> (2S,5R,6R)-6-[(2R)-2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-2-[(4S)-4-carboxy-5,5-dimethylthiazolidine-2-yl]acetamido]-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]-heptane-2-carboxylic acid.

<sup>n</sup> (2S,5R,6R)-6-[(2S,5R,6R)-6-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

## SPECIFIC TESTS

- **CRYSTALLINITY** (695): Meets the requirements
- **DIMETHYLANILINE** (223): Meets the requirement
- **pH** (791): 3.5–6.0

Sample solution: 2 mg/mL

- **WATER DETERMINATION, Method I** (921): 11.5%–14.5%
- **STERILITY TESTS** (71): Where the label states that Amoxicillin is sterile, it meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined*,

*Direct Inoculation of the Culture Medium*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (5 mg/mL) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, to use Soybean–Casein Digest Medium containing polysorbate 80 solution (5 mg/mL) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, and to shake the tubes once daily.

- **BACTERIAL ENDOTOXINS TEST** (85): Where the label states that Amoxicillin is sterile or Amoxicillin must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.25 USP Endotoxin Unit/mg of amoxicillin.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is intended for veterinary use only and that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. Label all other Amoxicillin to indicate that it is to be used in the manufacture of nonparenteral drugs only.

## USP REFERENCE STANDARDS (11)

USP Amoxicillin RS

USP Amoxicillin Related Compound A RS

(2S,5R,6R)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid; 6-aminopenicillanic acid.

C<sub>8</sub>H<sub>12</sub>N<sub>2</sub>O<sub>3</sub>S 216.26

USP Amoxicillin Related Compound D RS

(4S)-2-[[[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido](carboxy)methyl]-5,5-dimethylthiazolidine-4-carboxylic acid; amoxicillin open ring.

C<sub>16</sub>H<sub>21</sub>N<sub>3</sub>O<sub>6</sub>S 383.42

USP Endotoxin RS

## Amoxicillin Boluses

» Amoxicillin Boluses contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of amoxicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>5</sub>S).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label Boluses to indicate that they are for veterinary use only.

## USP Reference standards (11)—

USP Amoxicillin RS

## Identification—

**Test solution**—To a portion of powdered Boluses add 0.1 N hydrochloric acid to obtain a *Test solution* containing about 4 mg of amoxicillin per mL. Use within 10 minutes after preparation.

**Application volume, Developing solvent system, Procedure**—Proceed as directed for the *Identification* test under *Amoxicillin Tablets*.

**Disintegration** (701): 30 minutes, simulated gastric fluid being used instead of water.

**Water Determination, Method I** (921): not more than 7.5%.

## Assay—

**Diluent, Mobile phase, Standard preparation, and Chromatographic system**—Prepare as directed in the *Assay* under *Amoxicillin*.

**Assay preparation**—Weigh and finely powder not fewer than 5 Boluses. Transfer an accurately weighed portion of

the powder, equivalent to about 250 mg of amoxicillin, to a 250-mL volumetric flask, add *Diluent* to volume, and mix. Sonicate if necessary to ensure complete dissolution of the amoxicillin. Pass a portion of this solution through a filter of 1- $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*. [NOTE—Use this solution within 6 hours.]

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Amoxicillin*. Calculate the quantity, in mg, of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the portion of Boluses taken by the formula:

$$0.25CP(r_u/r_s)$$

in which the terms are as defined therein.

## Amoxicillin Capsules

### DEFINITION

Amoxicillin Capsules contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** Dissolve 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Buffer*. [NOTE—Use this solution within 6 h.]

**Sample solution:** Remove, as completely as possible, the contents of NLT 20 Capsules. Mix the combined contents, and transfer a quantity, equivalent to 200 mg of anhydrous amoxicillin, to a 200-mL volumetric flask. Add *Buffer* to volume. Sonicate if necessary to ensure complete dissolution. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in the portion of Capsules taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

Acceptance criteria: 90.0%–120.0%

### PERFORMANCE TESTS

#### DISSOLUTION (711)

##### Test 1

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm, for Capsules containing 250 mg

**Apparatus 2:** 75 rpm, for Capsules containing 500 mg

**Time:** 60 min

**Analytical wavelength:** UV 272 nm

**Standard solution:** USP Amoxicillin RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 90 min

**Analytical wavelength:** UV 272 nm

**Standard solution:** USP Amoxicillin RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

### SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- USP REFERENCE STANDARDS (11)**  
USP Amoxicillin RS

## Amoxicillin Intramammary Infusion

» Amoxicillin Intramammary Infusion is a suspension of Amoxicillin in a suitable vegetable oil vehicle. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ). It contains a suitable dispersing agent and preservative.

**Packaging and storage**—Preserve in well-closed disposable syringes.

**Labeling**—Label it to indicate that it is intended for veterinary use only.

**USP Reference standards (11)**—  
USP Amoxicillin RS

**Identification**—Transfer a quantity of Intramammary Infusion, equivalent to about 60 mg of amoxicillin, to a 50-mL centrifuge tube, add 25 mL of toluene, mix, and centrifuge. Decant and discard the toluene. Wash the residue with four 25-mL portions of toluene, sonicating for about 30 seconds

after each addition of toluene. Dry the residue in vacuum over silica gel. Add 15 mL of 0.1 N hydrochloric acid to the residue, and mix. The solution obtained responds to the *Identification* test under *Amoxicillin Capsules*.

**Water Determination, Method I (921):** not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

#### Change to read:

**Assay**—Proceed as directed for amoxicillin under *Antibiotics—Microbial Assays* (81). Expel the contents of 1 syringe of Intramammary Infusion into a high-speed glass blender jar containing 499.0 mL of *Buffer B.3* (CN 1-May-2017) and 1.0 mL of polysorbate 80, and blend for 3 to 5 minutes. Allow to stand for about 10 minutes, and dilute an accurately measured volume of the aqueous phase quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

### Amoxicillin for Injectable Suspension

» Amoxicillin for Injectable Suspension is a sterile mixture of Amoxicillin and one or more suitable buffers, preservatives, stabilizers, and suspending agents. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

#### Change to read:

**Packaging and storage**—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

**Labeling**—Label it to indicate that it is for veterinary use only.

#### USP Reference standards (11)—

USP Amoxicillin RS  
USP Endotoxin RS

**Identification**—Prepare a test solution containing the equivalent of 4 mg of amoxicillin per mL by adding 0.1 N hydrochloric acid to Amoxicillin for Injectable Suspension. Allow the solution to stand for 5 minutes before use: the solution responds to the *Identification* test under *Amoxicillin Capsules*.

**Bacterial Endotoxins Test** (85)—It contains not more than 0.25 Endotoxin Unit per mg of amoxicillin.

**Sterility Tests** (71)—It meets the requirements when tested as directed in the section *Direct Inoculation of the Culture Medium under Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, to use Soybean-Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, and to shake the tubes once daily.

**pH** (791): between 5.0 and 7.0, in the suspension constituted as directed in the labeling.

**Water Determination, Method I (921):** between 11.0% and 14.0%.

#### Assay—

*Diluent, Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Amoxicillin*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Amoxicillin for Injectable Suspension as directed in the labeling. Withdraw all of the withdrawable contents, using a hypodermic needle and syringe, and quantitatively dilute with *Diluent* to obtain a solution containing about 1 mg of anhydrous amoxicillin per mL. Pass a portion of this solution through a suitable filter of 1- $\mu$ m or finer porosity, and use the filtrate as *Assay preparation 1*. Use this solution within 6 hours.

*Assay preparation 2* (where the label states the quantity of amoxicillin in a given volume of constituted suspension)—Constitute Amoxicillin for Injectable Suspension as directed in the labeling. Quantitatively dilute an accurately measured volume of the constituted suspension with *Diluent* to obtain a solution containing about 1 mg of anhydrous amoxicillin per mL. Pass a portion of this solution through a suitable filter of 1- $\mu$ m or finer porosity, and use the filtrate as *Assay preparation 2*. Use this solution within 6 hours.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Amoxicillin*. Calculate the quantity, in mg, of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the container, or in the portion of constituted Suspension taken by the formula:

$$(L/D)(CP/1000)(r_u/r_s)$$

in which *L* is the labeled quantity, in mg, of anhydrous amoxicillin in the container, or in the volume of constituted suspension taken; *D* is the concentration, in mg of anhydrous amoxicillin per mL, of *Assay preparation 1* or of *Assay preparation 2* on the basis of the labeled quantity in the container or in the portion of constituted suspension taken, respectively, and the extent of dilution; and the other terms are as defined therein.

### Amoxicillin Oral Suspension

» Amoxicillin Oral Suspension is a suspension of Amoxicillin in Soybean Oil. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

**Packaging and storage**—Preserve in multiple-dose containers equipped with a suitable dosing pump.

**Labeling**—Label it to indicate that it is for veterinary use only.

#### USP Reference standards (11)—

USP Amoxicillin RS

**Identification**—Shake a portion of Oral Suspension with a mixture of acetone and 0.1 N hydrochloric acid (4:1) to obtain a solution containing about 1 mg of amoxicillin per mL. The solution responds to the *Identification* test under *Amoxicillin Capsules*.

**Water Determination, Method I (921):** not more than 2.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

#### Assay—

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics* (425), using USP Amoxicillin RS.

*Assay preparation*—Using the dosing pump, deliver a number of doses of Oral Suspension, equivalent to about 250 mg of amoxicillin, to a separator containing 100 mL of hexanes, and shake vigorously. Add 140 mL of water, and

shake for 5 minutes. Allow the layers to separate, and drain the lower, aqueous layer into a 250-mL volumetric flask. Repeat the extraction with two 50-mL portions of water. Combine the aqueous extracts in the volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed with Oral Suspension as directed for *Procedure under Iodometric Assay—Antibiotics* (425), using USP Amoxicillin RS. Calculate the quantity, in mg, of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in each dose of Oral Suspension taken by the formula:

$$(250 / N)(F / 2000)(B - I)$$

in which *N* is the number of doses taken, and the other terms are as defined therein.

## Amoxicillin for Oral Suspension

### DEFINITION

Amoxicillin for Oral Suspension contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ). It contains one or more suitable buffers, colors, flavors, preservatives, stabilizers, sweeteners, and suspending agents.

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** Dissolve 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Buffer*. [NOTE—Use this solution within 6 h.]

**Sample solution:** Dilute a measured volume of Amoxicillin for Oral Suspension, constituted as directed in the labeling, freshly mixed and free from air bubbles, quantitatively and stepwise in *Buffer* to obtain a solution containing nominally 1 mg/mL of anhydrous amoxicillin. Pass a portion of this solution through a suitable filter. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in the Amoxicillin for Oral Suspension taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of anhydrous amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

#### UNIFORMITY OF DOSAGE UNITS (905)

For solids packaged in single-unit containers: Meets the requirements

#### DELIVERABLE VOLUME (698):

Meets the requirements

### SPECIFIC TESTS

- pH (791):** 5.0–7.5, in the suspension constituted as directed in the labeling

- MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**  
USP Amoxicillin RS

## Amoxicillin Tablets

### DEFINITION

Amoxicillin Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Buffer*. [NOTE—Use this solution within 6 h.]

**Sample solution:** Place NLT 5 Tablets in a high-speed glass blender jar containing *Buffer* sufficient to yield a concentration of 1 mg/mL of anhydrous amoxicillin. Blend for  $4 \pm 1$  min, allow to stand for 5 min, and centrifuge a portion of the mixture. [NOTE—Where the volume of *Buffer* required would exceed 500 mL, place 5 Tablets in a volumetric flask of such capacity that when finally diluted to volume, a concentration of 1 mg of anhydrous amoxicillin per mL would be obtained. Add a volume of *Buffer* equivalent to three-fourths of the capacity of the volumetric flask, and sonicate for 5 min. Dilute with *Buffer* to volume, add a magnetic stirring bar, and stir for 30 min. Centrifuge a portion of this solution.]

Pass a portion of the clear supernatant through a suitable filter. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC  
 Detector: UV 230 nm  
 Column: 4-mm × 25-cm; 10-μm packing L1  
 Flow rate: 1.5 mL/min  
 Injection size: 10 μL  
 System suitability  
 Sample: Standard solution  
 Suitability requirements  
 Tailing factor: NMT 2.5  
 Relative standard deviation: NMT 2.0%

**Analysis**

Samples: Standard solution and Sample solution  
 Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of amoxicillin from the Sample solution  
 $r_S$  = peak response of amoxicillin from the Standard solution  
 $C_S$  = concentration of USP Amoxicillin RS in the Standard solution (mg/mL)  
 $C_U$  = nominal concentration of amoxicillin in the Sample solution (mg/mL)  
 $P$  = potency of amoxicillin in USP Amoxicillin RS (μg/mg)  
 $F$  = conversion factor, 0.001 mg/μg  
 Acceptance criteria: 90.0%–120.0%

**PERFORMANCE TESTS**• **DISSOLUTION** (711)

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Determine the amount of  $C_{16}H_{19}N_3O_5S$  dissolved by using the following method.

Buffer: 27.2 g of monobasic potassium phosphate in 3 L of water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ . Dilute with water to obtain 4 L of solution.

Mobile phase: Acetonitrile and Buffer (1:39)

Standard solution: 0.05 mg/mL of USP Amoxicillin RS in Buffer. [NOTE—Use this solution within 6 h.]

Sample solution: Pass a portion of the sample through a suitable filter of 0.5-μm pore size. Quantitatively dilute a volume of the filtrate with water to obtain an estimated concentration of 0.045 mg/mL of amoxicillin. Use this solution within 6 h.

**Chromatographic system**

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 230 nm

Column

Analytical: 3.9-mm × 30-cm; packing L1

Guard: 2-mm × 2-cm; packing L2

Column temperature: The analytical column is maintained at a constant temperature of  $40 \pm 1^\circ$ .

Flow rate: 0.7 mL/min

Injection size: 10 μL

System suitability

Sample: Standard solution

Suitability requirements

Capacity factor: 1.1–2.8

Column efficiency: NLT 1700 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 1.5%

**Analysis**

Samples: Standard solution and Sample solution  
 Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times D \times P \times F \times 100$$

$r_U$  = peak response of amoxicillin from the Sample solution

$r_S$  = peak response of amoxicillin from the Standard solution

$C_S$  = concentration of USP Amoxicillin RS in the Standard solution (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of the dissolution medium, 900 mL

$D$  = dilution factor for the Sample solution

$P$  = potency of amoxicillin in USP Amoxicillin RS (μg/mg)

$F$  = conversion factor, 0.001 mg/μg

Tolerances: NLT 75% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  is dissolved.

For products labeled as chewable Tablets: Proceed as directed above.

For chewable Tablets labeled to contain 200 or 400 mg

Time: 20 min

Tolerances: NLT 70% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  is dissolved.

For chewable Tablets labeled to contain 125 or 250 mg

Time: 90 min

Tolerances: NLT 70% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  is dissolved.

For veterinary products: Proceed as directed above, except use Apparatus 2 at 100 rpm.

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Label chewable Tablets to indicate that they are to be chewed before swallowing. Tablets intended solely for veterinary use are so labeled.
- **USP REFERENCE STANDARDS** (11)  
 USP Amoxicillin RS

**Amoxicillin Tablets for Oral Suspension****DEFINITION**

Amoxicillin Tablets for Oral Suspension contain NLT 90.0% and NMT 110.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

Standard solution: 4 mg/mL of USP Amoxicillin RS in 0.1 N hydrochloric acid. Use within 10 min of preparation.

Sample solution: An aqueous dispersion of Tablets for Oral Suspension in 0.1 N hydrochloric acid containing 4 mg/mL of amoxicillin. Use within 10 min of preparation.

**Chromatographic system**

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μL

Developing solvent system: Methanol, chloroform, pyridine, and water (90:80:1:30)

Spray reagent: 3 mg/mL of ninhydrin in alcohol

**Analysis**

Samples: Standard solution and Sample solution

Proceed as directed in the chapter. Dry the plate with the aid of a current of warm air for 10 min. Spray

lightly with *Spray reagent*, and dry at 110° for 15 min.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

## ASSAY

### PROCEDURE

**Diluent:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of 5.0 ± 0.1.

**Mobile phase:** Acetonitrile and *Diluent* (1:24). Decrease the acetonitrile concentration to increase the retention time of amoxicillin.

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Diluent*. Use this solution within 6 h.

**Sample solution:** Prepare a dispersion of 20 Tablets for Oral Suspension using a suitable aliquot of water. Dilute a portion of the dispersion with *Diluent* to obtain a solution containing 1.2 mg/mL of amoxicillin. Pass a portion of the solution through a filter of 1-μm or finer pore size. Use this solution within 6 h.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm × 25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 μL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Capacity factor:** 1.1–2.8

**Column efficiency:** NLT 1700 theoretical plates

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the portion of Tablets for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS (μg/mg)

$F$  = conversion factor, 0.001 mg/μg

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### DISINTEGRATION (701)

**Medium:** Water at 20 ± 5°

**Time:** 3 min

**Acceptance criteria:** Meet the requirements

### DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Buffer:** 27.2 g of monobasic potassium phosphate in 3 L of water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of 5.0 ± 0.1, and dilute with water to obtain 4 L of solution.

**Mobile phase:** Acetonitrile and *Buffer* (10:390). Pass through a filter of 0.5-μm or finer pore size.

**Standard solution:** 0.05 mg/mL of USP Amoxicillin RS in *Buffer*. Use this solution within 6 h.

**Sample solution:** Pass a portion of the sample through a filter of 0.5-μm or finer pore size. Dilute a suitable

aliquot of the filtrate with water to obtain a concentration of 0.045 mg/mL of amoxicillin. Use this solution within 6 h.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

### Columns

**Guard:** 2-mm × 2-cm; packing L2

**Analytical:** 3.9-mm × 30-cm; packing L1

**Column temperature:** 40 ± 1°

**Flow rate:** 0.7 mL/min

**Injection volume:** 10 μL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Capacity factor:** 1.1–2.8

**Column efficiency:** NLT 1700 theoretical plates

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 1.5%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times D \times P \times F \times (1/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$V$  = volume of medium, 900 mL

$D$  = dilution factor

$P$  = potency of amoxicillin in USP Amoxicillin RS (μg/mg)

$F$  = conversion factor, 0.001 mg/μg

$L$  = label claim (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## SPECIFIC TESTS

- **DISPERSION FINENESS:** Place 2 Tablets for Oral Suspension in 100 mL of water, and stir until completely dispersed. A smooth dispersion that passes through a No. 25 sieve is obtained.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**  
USP Amoxicillin RS

## Amoxicillin and Clavulanate Potassium for Oral Suspension

### DEFINITION

Amoxicillin and Clavulanate Potassium for Oral Suspension contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and the equivalent of NLT 90.0% and NMT 125.0% of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ ). It contains one or more suitable buffers, colors, flavors, preservatives, stabilizers, sweeteners, and suspending agents.

### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Buffer:** 7.8 g of monobasic sodium phosphate in 900 mL of water. Adjust with phosphoric acid or 10 N sodium hydroxide to a pH of  $4.4 \pm 0.1$ , and dilute with water to 1000 mL.

**Mobile phase:** Methanol and Buffer (1:19). Pass through a suitable filter.

**Standard solution:** 0.5 mg/mL of USP Amoxicillin RS and 0.2 mg/mL of USP Clavulanate Lithium RS in water

**Sample solution:** Nominally 0.5 mg/mL of amoxicillin in water, prepared as follows. Constitute Amoxicillin and Clavulanate Potassium for Oral Suspension with water using the volume specified in the labeling. Stir by mechanical means for 10 min, and filter. Use within 1 h.

**Chromatographic system**

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4-mm  $\times$  30-cm; 3- to 10- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** Standard solution

[NOTE—The relative retention times for clavulanic acid and amoxicillin are about 0.5 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.5 between the amoxicillin and clavulanic acid peaks

**Tailing factor:** NMT 1.5 for each analyte peak

**Relative standard deviation:** NMT 2.0% for each analyte peak

**Analysis**

**Samples:** Standard solution and Sample solution

Calculate the percentage of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the Amoxicillin and Clavulanate Potassium for Oral Suspension taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

$r_u$  = peak response of amoxicillin from the Sample solution

$r_s$  = peak response of amoxicillin from the Standard solution

$C_s$  = concentration of USP Amoxicillin RS in the Standard solution (mg/mL)

$C_u$  = nominal concentration of amoxicillin in the Sample solution (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

Calculate the percentage of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ ) in the Amoxicillin and Clavulanate Potassium for Oral Suspension taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times 100$$

$r_u$  = peak response of clavulanic acid from the Sample solution

$r_s$  = peak response of clavulanic acid from the Standard solution

$C_s$  = concentration of USP Clavulanate Lithium RS in the Standard solution (mg/mL)

$C_u$  = nominal concentration of clavulanic acid in the Sample solution (mg/mL)

$P$  = potency of clavulanic acid in USP Clavulanate Lithium RS (mg/mg)

**Acceptance criteria:** 90.0%–120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and 90.0%–125.0% of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ )

**PERFORMANCE TESTS****• DELIVERABLE VOLUME (698)**

For powder packaged in multiple-unit containers: Meets the requirements

**• UNIFORMITY OF DOSAGE UNITS (905)**

For powder packaged in single-unit containers: Meets the requirements

**SPECIFIC TESTS****• PH (791)**

**Sample solution:** Constitute as directed in the labeling, and perform the test immediately after constitution.

**Acceptance criteria:** 3.8–6.6

**• MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight containers, at controlled room temperature.**• USP REFERENCE STANDARDS (11)**

USP Amoxicillin RS

USP Clavulanate Lithium RS

**Amoxicillin and Clavulanate Potassium Tablets****DEFINITION**

**Suitability requirements**

**Resolution:** NLT 3.5 between the amoxicillin and clavulanic acid peaks

Tailing factor: NMT 1.5 for each analyte peak

Relative standard deviation: NMT 2.0%

#### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of amoxicillin from the Sample solution

$r_S$  = peak response of amoxicillin from the Standard solution

$C_S$  = concentration of USP Amoxicillin RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amoxicillin in the Sample solution (mg/mL)

$P$  = potency of USP Amoxicillin RS ( $\mu\text{g}/\text{mg}$ )

$F$  = conversion factor, 0.001 mg/ $\mu\text{g}$

Calculate the percentage of  $C_8H_9NO_5$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

$r_U$  = peak response of clavulanic acid from the Sample solution

$r_S$  = peak response of clavulanic acid from the Standard solution

$C_S$  = concentration of USP Clavulanate Lithium RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of clavulanic acid in the Sample solution (mg/mL)

$P$  = potency of clavulanic acid in USP Clavulanate Lithium RS (mg/mg)

Acceptance criteria: 90.0%–120.0%

#### PERFORMANCE TESTS

- **DISINTEGRATION** (701): Tablets labeled for veterinary use only; 30 min, simulated gastric fluid TS being substituted for water in the test

- **DISSOLUTION** (711)

[NOTE—Tablets labeled for veterinary use only are exempt from this requirement.]

##### Test 1

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 30 min; or 45 min where the Tablets are labeled as chewable

Analysis: Determine the amount of  $C_{16}H_{19}N_3O_5S$  and  $C_8H_9NO_5$  dissolved, using the Analysis set forth in the Assay, making any necessary volumetric adjustments.

Tolerances: NLT 85% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  and NLT 80% (Q) of the labeled amount of  $C_8H_9NO_5$  are dissolved.

For Tablets labeled as chewable: NLT 80% (Q) of the labeled amounts of  $C_{16}H_{19}N_3O_5S$  and  $C_8H_9NO_5$  is dissolved in 45 min.

Test 2: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium, Apparatus 2, and Analysis: Proceed as directed for Test 1.

Times: 45 min for amoxicillin, and 30 min for clavulanic acid

Tolerances: NLT 85% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  and NLT 80% (Q) of the labeled amount of  $C_8H_9NO_5$  are dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### SPECIFIC TESTS

- **WATER DETERMINATION**, Method I (921):

Tablet Label Claim Amoxicillin (mg/Tablet)	Acceptance Criteria, NMT (%)
≤250	7.5
>250 and ≤500	10.0
>500	11.0

For products labeled as chewable Tablets:

Tablet Label Claim Amoxicillin (mg/Tablet)	Acceptance Criteria, NMT (%)
≤125	6.0
>125	8.0

For Tablets labeled for veterinary use only: NMT 10.0%

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label chewable Tablets to include the word "chewable" in juxtaposition to the official name. The labeling indicates that chewable Tablets may be chewed before being swallowed or may be swallowed whole. Tablets intended for veterinary use only are so labeled. When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS** (11)  
USP Amoxicillin RS  
USP Clavulanate Lithium RS

### Amoxicillin and Clavulanic Acid Extended-Release Tablets

#### DEFINITION

Amoxicillin and Clavulanic Acid Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and clavulanic acid ( $C_8H_9NO_5$ ).

#### IDENTIFICATION

- **A.** The retention times of the major peaks of the Sample solution correspond to those of the Standard solution, as obtained in the Assay.

#### ASSAY

##### PROCEDURE

Buffer: 6.9 g/L of monobasic sodium phosphate adjusted with phosphoric acid to a pH of 4.2

Mobile phase: Methanol and Buffer (5:95)

Standard solution: 1 mg/mL of USP Amoxicillin RS and 62.5  $\mu\text{g}/\text{mL}$  of USP Clavulanate Lithium RS in water. Store the solution at 4°, and inject within 10 h.

Sample solution: Equivalent to 1 mg/mL of amoxicillin and 62.5  $\mu\text{g}/\text{mL}$  of clavulanic acid from finely powdered Tablets (NLT 6) in water. Stir for about 60 min. Store the solution at 4°, and inject within 12 h.

##### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC  
 Detector: UV 229 nm  
 Column: 8-mm × 10-cm; 5-μm packing L1  
 Flow rate: 2 mL/min  
 Injection volume: 20 μL  
 Autosampler temperature: 4°

**System suitability**

Sample: Standard solution

**Suitability requirements**

Resolution: NLT 2.0 between the amoxicillin and clavulanic acid peaks

Tailing factor: NMT 1.8 for the amoxicillin and clavulanic acid peaks

Relative standard deviation: NMT 1.0% for the amoxicillin and clavulanic acid peaks

**Analysis**

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = response of amoxicillin from the Sample solution

$r_S$  = response of amoxicillin from the Standard solution

$C_S$  = concentration of USP Amoxicillin RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amoxicillin in the Sample solution (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS (μg/mg)

$F$  = conversion factor, 0.001 mg/μg

Calculate the percentage of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

$r_U$  = response of clavulanic acid from the Sample solution

$r_S$  = response of clavulanic acid from the Standard solution

$C_S$  = concentration of USP Clavulanate Lithium RS in the Standard solution (μg/mL)

$C_U$  = nominal concentration of clavulanic acid in the Sample solution (μg/mL)

$P$  = potency of clavulanic acid in USP Clavulanate Lithium RS (mg/mg)

Acceptance criteria: 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION (711)****Test 1**

Medium: Water; 900 mL

Apparatus 2: 75 rpm

**Times**

Amoxicillin: 1, 3, and 5 h

Clavulanic acid: 1 h

Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Standard solution: USP Amoxicillin RS and USP Clavulanate Lithium RS in Medium at known concentrations similar to those expected in the Sample solution

Sample solution: Pass a portion of the solution under test through a suitable filter, and dilute with Medium, if necessary.

**Analysis**

Samples: Standard solution and Sample solution

Calculate the amounts of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and clavulanic acid ( $C_8H_9NO_5$ ) dissolved.

**Tolerances**

Amoxicillin: The percentage of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) dissolved at the times specified conforms to Table 1.

**Table 1**

Time (h)	Amount Dissolved (%)
1	50–65
3	65–85
5	NLT 85

Clavulanic acid: NLT 80% (Q) of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ ) is dissolved in 1 h.

**Test 2**

Medium: Water; 900 mL

Apparatus 2: 75 rpm

**Times**

Amoxicillin: 1, 3, and 5 h

Clavulanic acid: 45 min

Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Standard solution: USP Amoxicillin RS and USP Clavulanate Lithium RS in Medium at known concentrations similar to those expected in the Sample solution

Sample solution: Pass a portion of the solution under test through a suitable filter, and dilute with Medium, if necessary.

**Analysis**

Samples: Standard solution and Sample solution

Calculate the amounts of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and clavulanic acid ( $C_8H_9NO_5$ ) dissolved.

**Tolerances**

Amoxicillin: The percentage of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) dissolved at the times specified conforms to Table 2.

**Table 2**

Time (h)	Amount Dissolved (%)
1	50–70
3	65–90
5	NLT 85

Clavulanic acid: NLT 85% (Q) of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ ) is dissolved in 45 min.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES****• ORGANIC IMPURITIES**

Buffer: 13.8 g/L of monobasic sodium phosphate in water adjusted with phosphoric acid to a pH of 4.2

Solution A: Methanol and Buffer (1:199)

Solution B: Methanol and Buffer (10:90)

Mobile phase: See Table 3.

**Table 3**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
8	70	30
13	70	30
13.01	40	60
18	40	60
18.01	100	0
25	100	0
30	100	0

[NOTE—These gradient elution times are established on an HPLC system with a dwell volume of approximately 5 mL.

The gradient elution times in Table 3 can be adjusted as necessary to achieve the separation described.]

**System suitability solution:** 0.4 mg/mL of USP Amoxicillin RS and 30 µg/mL of USP Amoxicillin Related Compound D RS in water. Store the solution at 4°.

**Standard solution:** 0.4 mg/mL of USP Amoxicillin RS in water. Store the solution at 4°, and inject within 24 h.

**Sample solution:** 1 mg/mL of amoxicillin and 62.5 µg/mL of clavulanic acid from finely powdered Tablets (NLT 2) in water. Stir for about 60 min. Store the solution at 4°, and use within 24 h.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 5-cm; 3-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

**Autosampler temperature:** 4°

#### System suitability

**Samples:** System suitability solution and Standard solution

#### Suitability requirements

**Resolution:** NLT 1.25 between the amoxicillin and amoxicillin related compound D peaks at a relative retention time of 0.83, *System suitability solution*

**Tailing factor:** NMT 1.8 for the amoxicillin peak, *Standard solution*

**Relative standard deviation:** NMT 1.0% for the amoxicillin peak, *Standard solution*

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F_1 \times (1/F_2) \times 100$$

$r_U$  = response of each impurity from the *Sample solution*

$r_S$  = response of amoxicillin from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS (µg/mg)

$F_1$  = conversion factor, 0.001 mg/µg

$F_2$  = relative response factor (see Table 4)

**Acceptance criteria:** See Table 4. The reporting limit is 0.003%.

Table 4

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

<sup>l</sup> (2S,5R,6R)-6-[(2R)-2-[2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-2-(4S)-4-carboxy-5,5-dimethylthiazolidin-2-yl]acetamido]-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

## SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers and store at controlled room temperature.
- LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- USP REFERENCE STANDARDS (11)**
  - USP Amoxicillin RS
  - USP Amoxicillin Related Compound D RS
  - (4S)-2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamid-o](carboxymethyl)-5,5-dimethylthiazolidine-4-carboxylic acid.
  - $C_{16}H_{21}N_3O_6S$  383.42
  - USP Clavulanate Lithium RS

## Amphetamine Sulfate

$(C_9H_{13}N)_2 \cdot H_2SO_4$  368.49  
Benzeneethanamine,  $\alpha$ -methyl-, sulfate (2:1), ( $\pm$ ); ( $\pm$ )- $\alpha$ -Methylphenethylamine sulfate (2:1) [60-13-9].

## DEFINITION

Amphetamine Sulfate contains NLT 98.0% and NMT 102.0% of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  on the dried basis.

## IDENTIFICATION

- A. INFRARED ABSORPTION (197M)**
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Sulfate (191):** Meets the requirements  
*Sample solution:* 100 mg/mL

## ASSAY

### PROCEDURE

**Solution A:** Add 5.0 mL of trifluoroacetic acid to 900 mL of water, adjust with ammonium hydroxide to a pH of  $2.2 \pm 0.1$ , and add 100 mL of acetonitrile.

**Solution B:** Use degassed acetonitrile.

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	65	35
20	0	100
22	0	100
23	100	0
30	100	0

**Standard solution:** 2.0 mg/mL of USP Dextroamphetamine Sulfate RS in *Solution A*

**System suitability solution:** Transfer 40 mL of the *Standard solution* to a 50-mL volumetric flask. Using a microliter syringe, add 1  $\mu$ L each of USP Dextroamphetamine Related Compound A RS and USP Dextroamphetamine Related Compound B RS. Dilute with *Standard solution* to volume, and mix.

**Sample solution:** 2.0 mg/mL of Amphetamine Sulfate in *Solution A*

### Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 257 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Identify the peaks by the relative retention times in *Impurity Table 1* under *Organic Impurities*. Amphetamine and dextroamphetamine have exactly the same retention time.]

### Suitability requirements

**Resolution:** NLT 3.0 between dextroamphetamine related compound A and dextroamphetamine related compound B, *System suitability solution*

**Tailing factor:** NMT 3.0, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  in the portion of Amphetamine Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for amphetamine sulfate from the *Sample solution*

$r_S$  = peak response for dextroamphetamine sulfate from the *Standard solution*

$C_S$  = concentration of USP Dextroamphetamine Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amphetamine Sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

## IMPURITIES

### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.2%

### Organic Impurities

#### • PROCEDURE

Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

#### Analysis

Samples: Standard solution and Sample solution

[NOTE—Identify the impurities by the relative retention times in Impurity Table 1.]

Calculate the percentage of each impurity in the portion of Amphetamine Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each impurity from the Sample solution

$r_S$  = peak response for dextroamphetamine from the Standard solution

$C_S$  = concentration of USP Dextroamphetamine Sulfate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Amphetamine Sulfate in the Sample solution (mg/mL)

$F$  = relative response factor (see Impurity Table 1)

#### Acceptance criteria

Individual impurities: See Impurity Table 1.

Total impurities: NMT 1.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Cathinone	0.81	55.6	0.25
Amphetamine	1.0	1.0	—
Benzaldehyde	1.73	105.3	0.25
Dextroamphetamine related compound A	1.88	1.5	0.25
Dextroamphetamine related compound B	2.05	1.8	0.25
Individual unspecified impurity	—	1.0	0.1

## SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.
- **DEXTROAMPHETAMINE**: A solution (20 mg/mL) is optically inactive.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
  - USP Dextroamphetamine Sulfate RS
  - USP Dextroamphetamine Related Compound A RS
  - 1-Phenyl-2-propanol,  $C_9H_{12}O$  136.20 [CAS-14898-87-4].
  - USP Dextroamphetamine Related Compound B RS
  - Phenyl acetone,  $C_9H_{10}O$  134.18 [CAS-103-79-7].

## Amphetamine Sulfate Tablets

### DEFINITION

Amphetamine Sulfate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$ .

### IDENTIFICATION

- **A. MELTING RANGE OR TEMPERATURE**, Class I (741)

Sample: Macerate a quantity of powdered Tablets, equivalent to 50 mg of amphetamine sulfate, with 10 mL of water for 30 min, and filter into a small flask. To the filtrate add 3 mL of 1 N sodium hydroxide. Cool to 10°–15°, add 1 mL of a mixture of absolute ether and benzoyl chloride (2:1), insert the stopper, and shake well for 3 min. Filter the precipitate, wash with 15 mL of cold water, and recrystallize twice from diluted alcohol. Dry the residue at 80° for 2 h.

Acceptance criteria: The crystals of the benzoyl derivative of amphetamine melt between 131° and 135°.

- **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

Diluted acetic acid: 14 mL of glacial acetic acid in 100 mL of water

Mobile phase: Dissolve 1.1 g of sodium 1-heptanesulfonate in 525 mL of water. Add 25 mL of diluted acetic acid and 450 mL of methanol. Adjust with glacial acetic acid to a pH of  $3.3 \pm 0.1$ . Pass through a 0.5- $\mu$ m membrane filter.

Standard solution: 0.3 mg/mL of USP Dextroamphetamine Sulfate RS in 0.12 N phosphoric acid

Sample solution: Nominally 0.3 mg/mL of amphetamine sulfate from NLT 20 finely powdered Tablets prepared as follows. Transfer a suitable amount of the powdered tablets to a suitable volumetric flask. Add 80% of the flask volume of 0.12 N phosphoric acid, and sonicate for 15 min. Dilute with 0.12 N phosphoric acid to volume. Pass through a 0.5- $\mu$ m membrane filter, discarding the first 20 mL of the filtrate.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm  $\times$  30-cm; 10- $\mu$ m packing L1

Flow rate: 2 mL/min. [NOTE—A 4.6-mm  $\times$  25-cm column; 5- $\mu$ m packing L1 may be used with a flow rate of 1 mL/min.]

Injection size: 50  $\mu$ L

#### System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 3

Relative standard deviation: NMT 2.0%

#### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Dextroamphetamine Sulfate RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of amphetamine sulfate in the Sample solution (mg/mL)

Acceptance criteria: 93.0%–107.0%

## PERFORMANCE TESTS

### • DISSOLUTION, Procedure for a Pooled Sample (711)

Medium: Water; 500 mL

Apparatus 1: 100 rpm

Time: 45 min

**Standard solution:** USP Dextroamphetamine Sulfate RS in Medium having a known concentration of USP Dextroamphetamine Sulfate RS similar to the concentration expected in the sample.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Diluted acetic acid:** 14 mL of glacial acetic acid in 100 mL of water

**Mobile phase:** 1.1 g of sodium 1-heptanesulfonate in 575 mL of water. Add 25 mL of Diluted acetic acid and 400 mL of methanol. Adjust with glacial acetic acid to a pH of  $3.3 \pm 0.1$ .

### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm  $\times$  30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 500  $\mu$ L

### System suitability

Sample: Standard solution

### Suitability requirements

Relative standard deviation: NMT 2.0%

### Analysis

Calculate the percentage of the labeled amount of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$  dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of the Standard solution (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of Medium, 500 mL

**Tolerances:** NLT 75% (Q) of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$  is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in well-closed containers.

### • USP REFERENCE STANDARDS (11)

USP Dextroamphetamine Sulfate RS

9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-14,39-dioxabicyclo[33.3.1]nonatriaconta-19,21,23,25,27,29,31-heptaene-36-carboxylic acid [1397-89-3].

» Amphotericin B has a potency of not less than 750  $\mu$ g of  $C_{47}H_{73}NO_{17}$  per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store in a cold place.

**Labeling**—Label it to state whether it is intended for use in preparing dermatological and oral dosage forms or parenteral dosage forms.

### USP Reference standards (11)—

USP Amphotericin B RS

USP Nystatin RS

### Identification, Ultraviolet Absorption (197U)—

**Spectral range 1:** 240 to 320 nm.

**Solution 1:** prepared as directed for Test preparation in the Limit of amphotericin A, and compare its absorbance to that of the Amphotericin B standard preparation. An extra peak may occur at 304 nm in the spectrum of this solution.

**Spectral range 2:** 320 to 400 nm.

**Solution 2:** prepared as directed for Test preparation in the Limit of amphotericin A and then diluted with 9 volumes of methanol. Compare its absorbance to that of a similar dilution of the Amphotericin B standard preparation.

**Loss on drying (731)**—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

**Residue on ignition (281):** not more than 0.5%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid. [NOTE—Amphotericin B intended for use in preparing dermatological creams, lotions, and ointments, and oral suspensions and capsules, yields not more than 3.0%.]

### Limit of amphotericin A—

**Test preparation**—Dissolve about 50 mg of Amphotericin B, accurately weighed, in 10.0 mL of dimethyl sulfoxide in a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

**Nystatin standard preparation**—Dissolve about 20 mg of USP Nystatin RS, accurately weighed, in 40.0 mL of dimethyl sulfoxide in a 200-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

**Amphotericin B standard preparation**—Dissolve about 50 mg of USP Amphotericin B RS, accurately weighed, in 10.0 mL of dimethyl sulfoxide in a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Prepare this solution fresh daily.

**Procedure**—Concomitantly determine the absorbances of the Nystatin and Amphotericin B standard preparations and the Test preparation in 1-cm cells at 304 nm and at 282 nm, with a suitable spectrophotometer, using a 1 in 62.5 solution of dimethyl sulfoxide in methanol as the blank. Calculate the percentage of amphotericin A taken by the formula:

$$25W_N[(A_{B_{282}} \times A_{U_{304}}) - (A_{B_{304}} \times A_{U_{282}})] / [(A_{B_{282}} \times A_{N_{304}}) - (A_{B_{304}} \times A_{N_{282}})]W_U$$

in which  $W_N$  is the weight, in mg, of USP Nystatin RS taken,  $A_{B_{282}}$  and  $A_{B_{304}}$  are the absorbances of the Amphotericin B standard preparation at 282 nm and 304 nm, respectively,  $A_{N_{282}}$  and  $A_{N_{304}}$  are the absorbances of the Nystatin standard

## Amphotericin B

$C_{47}H_{73}NO_{17}$  924.08

Amphotericin B.

Amphotericin B.

[1R-(1R\*,3S\*,5R\*,6R\*,9R\*,11R\*,15S\*,16R\*,17R\*,18S\*,19E\*,21E,23E,25E,27E,29E,31E,33R\*,35S\*,36R\*,37S\*))]-33-[(3-Amino-3,6-dideoxy- $\beta$ -D-mannopyranosyl)oxy]-1,3,5,6,

preparation at 282 nm and 304 nm, respectively,  $A_{U282}$  and  $A_{U304}$  are the absorbances of the *Test preparation* at 282 nm and 304 nm, respectively, and  $W_U$  is the weight, in mg, of the Amphotericin B taken: not more than 5%, calculated on the dried basis, is found. [NOTE—Amphotericin B intended for use in preparing dermatological creams, lotions, and ointments, and oral suspensions and capsules, contains not more than 15% of amphotericin A, calculated on the dried basis.]

**Assay**—Proceed with amphotericin B as directed under *Antibiotics—Microbial Assays* (81).

## Amphotericin B Cream

» Amphotericin B Cream contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of Amphotericin B.

**Packaging and storage**—Preserve in collapsible tubes, or other well-closed containers.

**USP Reference standards** (11)—

USP Amphotericin B RS

**Minimum fill** (755): meets the requirements.

### Change to read:

**Assay**—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), blending a suitable accurately weighed portion of Cream in a high-speed blender with a sufficient accurately measured volume of dimethyl sulfoxide to give a convenient concentration. Quantitatively dilute an accurately measured volume of this solution with dimethyl sulfoxide to obtain a stock solution having a concentration of about 20 µg of amphotericin B per mL. Quantitatively dilute an accurately measured volume of this stock solution with **Buffer B.10** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Amphotericin B for Injection

» Amphotericin B for Injection is a sterile complex of Amphotericin B and deoxycholate sodium and one or more suitable buffers. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{47}H_{73}NO_{17}$ .

### Change to read:

**Packaging and storage**—Preserve as described in **Packaging and Storage Requirements** (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017), in a refrigerator and protected from light.

**Labeling**—Label it to indicate that it is intended for use by intravenous infusion to hospitalized patients only, and that the solution should be protected from light during administration.

**USP Reference standards** (11)—

USP Amphotericin B RS

USP Endotoxin RS

**Bacterial Endotoxins Test** (85)—It contains not more than 5.0 USP Endotoxin Units per mg of amphotericin B. For products used or labeled for intrathecal injection, it contains not more than 0.9 USP Endotoxin Unit per mg of amphotericin B.

**Sterility Tests** (71)—It meets the requirements when tested as directed in the section *Membrane Filtration under Test for Sterility of the Product to be Examined*, 50 mg from each container being tested.

**pH** (791): between 7.2 and 8.0, in an aqueous solution containing 10 mg of amphotericin B per mL.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 8.0% of its weight.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* (7), *Labels and Labeling for Injectable Products*.

### Change to read:

#### Assay—

*Assay preparation 1* (where it is packaged as a single-dose container)—Constitute Amphotericin B for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively and stepwise with dimethyl sulfoxide to obtain a solution containing about 20 µg of amphotericin B per mL.

*Assay preparation 2* (where the labeling states the quantity of amphotericin B in a given volume of constituted solution)—Constitute Amphotericin B for Injection as directed in the labeling. Withdraw an accurately measured volume of the resultant solution, using a suitable hypodermic needle and syringe, and dilute quantitatively and stepwise with dimethyl sulfoxide to obtain a solution containing about 20 µg of amphotericin B per mL.

*Procedure*—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively and stepwise with **Buffer B.10** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Amphotericin B Lotion

» Amphotericin B Lotion contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of amphotericin B.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Amphotericin B RS

**Minimum fill** (755): meets the requirements.

**pH** (791): between 5.0 and 7.0.

### Change to read:

**Assay**—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), quantitatively dissolving a suitable accurately measured volume of Lotion in sufficient dimethyl sulfoxide to give a convenient concentration. Quantitatively dilute an accurately measured volume of this solution with dimethyl sulfoxide to obtain a stock solution having a concentration of about 20 µg of amphotericin B per mL. Quantitatively dilute an accurately measured vol-

ume of this stock solution with **Buffer B.10** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Amphotericin B Ointment

» Amphotericin B Ointment is Amphotericin B in a suitable ointment base. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of amphotericin B.

**Packaging and storage**—Preserve in collapsible tubes, or other well-closed containers.

### USP Reference standards (11)—

USP Amphotericin B RS

**Minimum fill** (755): meets the requirements.

**Water Determination, Method 1** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

### Change to read:

**Assay**—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment, equivalent to about 30 mg of amphotericin B, mixed with 10.0 mL of ether in a suitable glass-stoppered conical flask and allowed to stand, with intermittent shaking, for 1 hour. Add 20.0 mL of dimethyl sulfoxide and shake by mechanical means for 10 minutes. Dilute quantitatively and stepwise with dimethyl sulfoxide to a concentration of approximately 20 µg per mL. Quantitatively dilute an accurately measured volume of this stock solution with **Buffer B.10** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Ampicillin

$C_{16}H_{19}N_3O_4S$  (anhydrous) 349.41  
4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, [6-(aminophenylacetyl)amino]-3,3-dimethyl-7-oxo-, [2*S*-[2*α*,5*α*,6*β*(*S*<sup>\*</sup>)]-;  
(2*S*,5*R*,6*R*)-6-[(*R*)-2-Amino-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid [69-53-4].  
Trihydrate 403.46  
[7177-48-2].

### DEFINITION

Ampicillin is anhydrous or contains three molecules of water of hydration. It contains NLT 900 µg/mg and NMT 1050 µg/mg of ampicillin ( $C_{16}H_{19}N_3O_4S$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** (197K): Except that where the specimen under test is the trihydrate, both it and the USP Ampicillin Trihydrate RS are undried.

### ASSAY

#### • PROCEDURE

**Solution A:** 6.54 g/L of monobasic potassium phosphate and 0.34 g/L of dibasic potassium phosphate, adjusted with 1 N sodium hydroxide or 1 N phosphoric acid to a pH of 5.5 before final dilution

**Solution B:** Acetonitrile and *Solution A* (2:23)

**Solution C:** Acetonitrile and *Solution A* (3:7)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution B (%)	Solution C (%)
0	100	0
6	100	0
15	0	100
16	0	100
18	100	0
20	100	0

**Solution D:** 46.3 g/L of monobasic potassium phosphate and 27.8 g/L of dibasic potassium phosphate, adjusted with 1 N sodium hydroxide or 1 N phosphoric acid to a pH of 6.5 before final dilution

**System suitability solution:** 0.5 mg/mL of USP Ampicillin RS and 0.1 mg/mL of USP Amoxicillin RS in acetonitrile, water, and *Solution D* (4:91:5) prepared as follows. Dissolve first in a mixture of acetonitrile, water, and *Solution D* (4:30:5), sonicating if necessary, and dilute with water to volume.

**Standard solution:** 0.5 mg/mL of USP Ampicillin RS in acetonitrile, water, and *Solution D* (4:91:5) prepared as follows. Dissolve first in a mixture of acetonitrile, water, and *Solution D* (4:30:5), sonicating if necessary, and dilute with water to volume. Analyze immediately after preparation.

**Sample solution:** 0.5 mg/mL of Ampicillin in acetonitrile, water, and *Solution D* (4:91:5) prepared as follows. Dissolve first in a mixture of acetonitrile, water, and *Solution D* (4:30:5), sonicating if necessary, and dilute with water to volume. Analyze immediately after preparation.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

### Suitability requirements

**Resolution:** NLT 10 between ampicillin and amoxicillin, *System suitability solution*

**Tailing factor:** NMT 1.4 for ampicillin, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in µg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in each mg of Ampicillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

- $r_U$  = peak response from the *Sample solution*
- $r_S$  = peak response from the *Standard solution*
- $C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)
- $C_U$  = concentration of Ampicillin in the *Sample solution* (mg/mL)
- $P$  = potency of USP Ampicillin RS (µg/mg)

Acceptance criteria: 900–1050 µg/mg on the anhydrous basis

## IMPURITIES

### • ORGANIC IMPURITIES, PROCEDURE 1

*Organic Impurities, Procedure 1* is recommended when the impurity profile includes ampicillin thiazepine.

**Solution A, Solution B, Solution C, Mobile phase, Solution D, System suitability solution, Sample solution, and Chromatographic system:** Prepare as directed in the Assay.

**Standard stock solution:** Prepare as directed for the Standard solution in the Assay.

**Standard solution:** 0.005 mg/mL of ampicillin in Solution D and water (1:19) from Standard stock solution. Transfer an aliquot of the Standard stock solution to a suitable volumetric flask, add Solution D, using about 5% of the final volume, and dilute with water to volume. Analyze immediately after preparation.

**Sensitivity solution:** 0.5 µg/mL of ampicillin in Solution D and water (1:19) from the Standard solution. Transfer an aliquot of the Standard solution to a suitable volumetric flask, add Solution D, using about 5% of the final volume, and dilute with water to volume.

### System suitability

**Samples:** Sensitivity solution, System suitability solution, and Standard solution

### Suitability requirements

**Signal-to-noise ratio:** NLT 3, Sensitivity solution

**Resolution:** NLT 10 between ampicillin and amoxicillin, System suitability solution

**Tailing factor:** NMT 1.4 for ampicillin, System suitability solution

**Relative standard deviation:** NMT 10.0%, Standard solution

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Ampicillin taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

$r_u$  = peak response of each impurity from the Sample solution

$r_s$  = peak response of ampicillin from the Standard solution

$C_s$  = concentration of USP Ampicillin RS in the Standard solution (mg/mL)

$C_u$  = concentration of Ampicillin in the Sample solution (mg/mL)

$P$  = potency of USP Ampicillin RS (µg/mg)

$F$  = conversion factor, 0.001 mg/µg

**Acceptance criteria:** See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
D-Phenylglycine <sup>a</sup>	0.27	0.5

<sup>g</sup> (2S,5R,6R)-6-[(R)-2-[(R)-2-Amino-2-phenylacetamido]-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>h</sup> (2S,5R,6R)-6-[(2R)-2-[2-[(R)-2-Amino-2-phenylacetamido]-2-[(4S)-4-carboxy-5,5-dimethylthiazolidin-2-yl]acetamido]-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>i</sup> (4S,4'S)-2'-[[(1R,7R,13R)-1-Amino-14-[(2S,5R,6R)-2-carboxy-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptan-6-ylamino]-2,5,8,11,14-penta-oxo-1,7,13-triphenyl-3,6,9,12-tetraazatetradecane-4,10-diyl]bis(5,5-dimethylthiazolidine-4-carboxylic acid)]

### • ORGANIC IMPURITIES, PROCEDURE 2, DIMETHYLANILINE (223):

Meets the requirements

*Organic Impurities, Procedure 2* is recommended when dimethylaniline is used during the production of Ampicillin.

### • ORGANIC IMPURITIES, PROCEDURE 3

*Organic Impurities, Procedure 3* is recommended when the impurity profile includes phenylpyrazinol, pivaloyl phenylglycine, pivaloyl aminopenicillanic acid, diphenyldiketopiperazine, and open ring dimer.

**Solution A:** 4 g/L of monobasic sodium phosphate dihydrate adjusted with 1 N sodium hydroxide to a pH of 5.0

**Solution B:** Acetonitrile

**Mobile phase:** See Table 3.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	98	2
20	90	10
40	85	15
50	80	20
55	75	25

Table 3 (Continued)

Time (min)	Solution A (%)	Solution B (%)
60	75	25
62	98	2
70	98	2

**Diluent:** Acetonitrile and *Solution A* (2:98)

**System suitability solution:** 1.5 mg/mL of USP Ampicillin System Suitability Mixture RS in *Diluent*

**Standard solution:** 15 µg/mL of USP Ampicillin RS in *Diluent*

**Sample solution:** 1.5 mg/mL of Ampicillin in *Diluent*. Store the sample in the refrigerator, and discard after 60 min.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L7

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

**Autosampler temperature:** 4°

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between the pivaloyl phenylglycine and diphenyldiketopiperazine peaks, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Ampicillin taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

$r_u$  = peak response of each impurity from the *Sample solution*

$r_s$  = peak response of ampicillin from the *Standard solution*

$C_s$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Ampicillin in the *Sample solution* (mg/mL)

$P$  = potency of ampicillin in USP Ampicillin RS (µg/mg)

$F$  = conversion factor, 0.001 mg/µg

**Acceptance criteria:** See *Table 4* and *Table 5*. The limits in *Table 5* are to be used only where Ampicillin is intended for use in preparing veterinary products.

Organic Impurities, Procedure 4 is recommended when the impurity profile includes ampicilloyl aminopenicillanic acid and penicillanyl ampicillinamide.

**Solution A:** 3.4 g/L of dibasic sodium phosphate dodecahydrate and 1.4 g/L of monobasic potassium phosphate adjusted with phosphoric acid to a pH of 5.5

**Solution B:** Acetonitrile

**Mobile phase:** See Table 6.

Table 6

Time (min)	Solution A (%)	Solution B (%)
0	99	1
1.5	95	5
6.5	90	10
7.5	89	11
13.5	84	16
16.5	75	25
18	60	40
25	99	1

**Standard solution:** 30 µg/mL of USP Amoxicillin Related Compound A RS, 30 µg/mL of D-phenylglycine, and 25 µg/mL of USP Ampicillin RS in *Solution A*

**Sample solution:** 2.5 mg/mL of Ampicillin in *Solution A*. Store the *Sample solution* in the refrigerator, and use within 9 h.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.0-mm × 15-cm; 3-µm packing L1

**Column temperature:** 40°

**Flow rate:** 1.3 mL/min

**Injection volume:** 5 µL

**Autosampler temperature:** 4°

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.5 between D-phenylglycine and amoxicillin related compound A

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Ampicillin taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

$r_u$  = peak response of each impurity from the *Sample solution*

$r_s$  = peak response of ampicillin from the *Standard solution*

$C_s$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Ampicillin in the *Sample solution* (mg/mL)

$P$  = potency of ampicillin in USP Ampicillin RS (µg/mg)

$F$  = conversion factor, 0.001 mg/µg

**Acceptance criteria:** See Table 7. Disregard any peak with an area less than 0.03 times the area of the ampicillin peak in the *System suitability solution*.

**Sample solution:** Dissolve 6 g in 800 mL of *Fluid D* containing sufficient sterile penicillinase to inactivate the ampicillin, and swirl the vessel until dissolution is complete before filtering.

**Acceptance criteria:** Where the label states that Ampicillin is sterile, it meets the requirements when

tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

**• CRYSTALLINITY (695):** Meets the requirements**• PH (791)**

**Sample solution:** 10 mg/mL

**Acceptance criteria:** 3.5–6.0

**• WATER DETERMINATION, Method I (921):** NMT 2.0% where it is labeled as Ampicillin (anhydrous); between 12.0% and 15.0% where it is labeled as Ampicillin (trihydrate)**• BACTERIAL ENDOTOXINS TEST (85):** Where the label states that Ampicillin is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.15 USP Endotoxin Unit/mg of ampicillin.**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight containers.**• LABELING:** Label to indicate whether it is anhydrous or is the trihydrate. Where the quantity of ampicillin is indicated in the labeling of any preparation containing Ampicillin, this shall be understood to be in terms of anhydrous ampicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S). Where it is intended for use in preparing injectable dosage forms, the label states that it is the trihydrate and that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

If a test for *Organic Impurities* other than *Procedures 1* and *2* is used, then the labeling states with which *Organic Impurities* test the article complies. Where it is intended for use in preparing veterinary products, the label so states.

**• USP REFERENCE STANDARDS (11)**

USP Amoxicillin RS

USP Amoxicillin Related Compound A RS

(2S,5R,6R)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

C<sub>16</sub>H<sub>14</sub>N<sub>2</sub>O<sub>2</sub> 266.29

USP Ampicillin RS

USP Ampicillin System Suitability Mixture RS

This is a mixture which contains ampicillin, pivaloyl phenylglycine [(R)-2-phenyl-2-pivalamidoacetic acid; C<sub>13</sub>H<sub>17</sub>NO<sub>3</sub>; 235.28], diphenyldiketopiperazine (3,6-diphenylpiperazine-2,5-dione; C<sub>16</sub>H<sub>14</sub>N<sub>2</sub>O<sub>2</sub>; 266.29), and other related compounds.

USP Ampicillin Trihydrate RS

USP Endotoxin RS

**Ampicillin Boluses**

» Ampicillin Boluses contain an amount of ampicillin (as the trihydrate) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Boluses to indicate that they are for veterinary use only.

**USP Reference standards (11)**—

USP Ampicillin RS

**Identification**—Powder 1 or more Boluses, and prepare a solution containing the equivalent of 10 mg of ampicillin per mL in a mixture of acetone and 0.1 N hydrochloric acid (4:1); the resulting solution responds to the *Identification* test under *Ampicillin Capsules*.

**Uniformity of dosage units (905):** meet the requirements.

**Loss on drying** (731): not more than 5.0%.

#### Assay—

**Standard preparation**—Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics* (425), using USP Ampicillin RS.

**Assay preparation**—Place not fewer than 5 Boluses in a high-speed glass blender jar containing an accurately measured volume of water, and blend for  $4 \pm 1$  minutes. Dilute an accurately measured volume of this stock solution quantitatively and stepwise with water to obtain an *Assay preparation* containing about 1.25 mg of ampicillin per mL.

**Procedure**—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425). Calculate the quantity, in mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in each Bolus taken by the formula:

$$(T/D)(F/2000)(B-I)$$

in which  $T$  is the labeled quantity, in mg, of ampicillin in each Bolus; and  $D$  is the concentration, in mg per mL, of ampicillin in the *Assay preparation* on the basis of the labeled quantity in each Bolus and the extent of dilution.

## Ampicillin Capsules

### DEFINITION

Ampicillin Capsules contain an amount of ampicillin (anhydrous or as the trihydrate) equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHY

**Diluent:** Acetone and 0.1 N hydrochloric acid (4:1)

**Standard solution:** 5 mg/mL of USP Ampicillin RS in Diluent

**Sample solution:** 5 mg/mL of ampicillin in Diluent from the contents of Capsules

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 2  $\mu$ L

**Developing solvent system:** Acetone, toluene, glacial acetic acid, and water (650:100:25:100)

**Spray reagent:** 3 mg/mL of ninhydrin in alcohol

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Apply the *Standard solution* and the *Sample solution* to the plate, and develop the chromatogram using the *Developing solvent system*. When the solvent front has moved about three-fourths of the length of the plate, remove the plate from the chamber, mark the solvent front, and allow to air-dry. Locate the spots on the plate by spraying lightly with *Spray reagent*, and dry at 90° for 15 min.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

### ASSAY

#### • PROCEDURE

**Standard solution:** Prepare as directed for *Standard Preparation* in *Iodometric Assay—Antibiotics* (425), using USP Ampicillin RS.

**Sample solution:** Nominally 1.25 mg/mL of ampicillin prepared as follows. Place NLT 5 Capsules in a high-speed glass blender jar containing a suitable volume of water, and blend for  $4 \pm 1$  min. Dilute a suitable aliquot with water.

**Analysis:** Proceed as directed for *Procedure* in *Iodometric Assay—Antibiotics* (425).

Calculate the percentage of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the portion of Capsules taken:

$$\text{Result} = (B - I) \times (F_1/2) \times (1/C_U) \times F_2 \times 100$$

$B$  = volume of 0.01 N sodium thiosulfate consumed in the *Blank Determination* (mL)

$I$  = volume of 0.01 N sodium thiosulfate consumed in the *Inactivation and Titration* of the *Sample solution* (mL)

$F_1$  = factor as calculated in *Iodometric Assay—Antibiotics* (425)

$C_U$  = nominal concentration of ampicillin in the *Sample solution* (mg/mL)

$F_2$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

#### • DISSOLUTION, *Procedure for a Pooled Sample* (711)

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Standard solution:**  $L/900$  mg/mL of USP Ampicillin RS in water, where  $L$  is the labeled amount of ampicillin in mg/Capsule

**Sample solution:** Use a filtered portion of the solution under test.

**Solution A:** 1 in 1000 solution of polyoxyethylene (23) lauryl ether in water

**Solution B:** Dissolve 20 g of hydroxylamine hydrochloride in 5 mL of *Solution A*, and add water to make 1000 mL.

**Buffer:** 26 mg/mL of sodium hydroxide and 3.1 mg/mL of sodium acetate in water

**Ferric nitrate solution:** Suspend 233 g of ferric nitrate in about 600 mL of water, add 2.8 mL of sulfuric acid, stir until the ferric nitrate is dissolved, add 1 mL of polyoxyethylene (23) lauryl ether, dilute with water to 1000 mL, and mix.

**Apparatus:** Automatic analyzer consisting of (1) a liquid sampler, (2) a proportioning pump, (3) suitable spectrophotometers equipped with matched flow cells and analysis capability at 480 nm, (4) a means of recording spectrophotometric readings, and/or computer for data retrieval and calculation, and (5) a manifold consisting of the components illustrated in *Figure 1*.

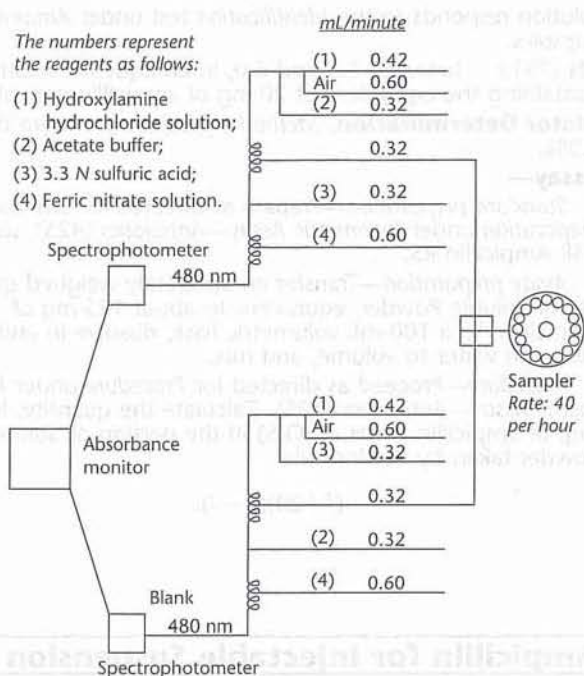

Figure 1

**Analysis:** With the sample line pumping water, the other lines pumping their respective reagents, and the spectrophotometer set at 480 nm, standardize the system until a steady absorbance baseline has been established. Transfer portions of the *Standard solution* and the *Sample solution* to sampler cups, and place in the sampler. Start the sampler, and conduct determinations of the *Standard solution* and the *Sample solution* typically at the rate of 40/h using a ratio of about 2:1 for sample and wash time.

Calculate the percentage of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times P \times F \times (1/L) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)  
 $V$  = volume of *Medium*, 900 mL  
 $P$  = potency of ampicillin in USP Ampicillin RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$   
 $L$  = label claim (mg/Capsule)

**Tolerances:** NLT 75% (Q) of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### SPECIFIC TESTS

- **WATER DETERMINATION, Method I** (921): NMT 4.0% where the Capsules contain anhydrous ampicillin, or between 10.0% and 15.0% where the Capsules contain ampicillin trihydrate

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Label the Capsules to indicate whether the ampicillin therein is in the anhydrous form or is the trihydrate.

- **USP REFERENCE STANDARDS** (11)  
USP Ampicillin RS

## Ampicillin for Injection

### DEFINITION

Ampicillin for Injection contains an amount of Ampicillin Sodium equivalent to NLT 90.0% and NMT 115.0% of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, water, 1 M monobasic potassium phosphate, and 1 N acetic acid (80:909:10:1)

**Diluent:** Water, 1 M monobasic potassium phosphate, and 1 N acetic acid (989:10:1)

**Standard solution:** 1 mg/mL of USP Ampicillin RS in *Diluent*. Shake and sonicate, if necessary, to dissolve. Use this solution promptly after preparation.

**System suitability solution:** 0.12 mg/mL of caffeine in the *Standard solution*

**Sample solution 1** (where it is represented as being in a single-dose container): 1 mg/mL of ampicillin in *Diluent*. Constitute Ampicillin for Injection in a volume of *Diluent*, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute with *Diluent*. Use this solution promptly after preparation.

**Sample solution 2** (where the label states the quantity of ampicillin in a given volume of constituted solution): 1 mg/mL of ampicillin in *Diluent*. Constitute 1 container of Ampicillin for Injection in a volume of *Diluent*, corresponding to the volume of solvent specified in the labeling. Dilute a suitable aliquot of the constituted solution with *Diluent*. Use this solution promptly after preparation.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Columns**

**Precolumn:** 4-mm  $\times$  5-cm; 5- to 10- $\mu\text{m}$  packing L1

**Analytical:** 4-mm  $\times$  30-cm; 5- to 10- $\mu\text{m}$  packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu\text{L}$

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ampicillin and caffeine are 0.5 and 1.0, respectively, *System suitability solution*.]

#### Suitability requirements

**Resolution:** NLT 2.0 between caffeine and ampicillin, *System suitability solution*

**Tailing factor:** NMT 1.4, *Standard solution*

**Capacity factor:** NMT 2.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution 1* or *Sample solution 2*

Calculate the percentage of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the container or in the volume of constituted solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

- $C_U$  = concentration of *Sample solution 1* or *Sample solution 2* (mg/mL)  
 $P$  = potency of ampicillin in USP Ampicillin RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$

Where the test for *Uniformity of Dosage Units* has been performed using the *Procedure for content uniformity*, use the average of these determinations as the Assay value.

Acceptance criteria: 90.0%–115.0%

## PERFORMANCE TESTS

### • UNIFORMITY OF DOSAGE UNITS (905)

*Procedure for content uniformity*

**Analysis:** Perform the Assay on individual containers using *Sample solution 1* or *Sample solution 2*, or both, as appropriate.

Acceptance criteria: Meets the requirements

## SPECIFIC TESTS

- **CRYSTALLINITY (695):** Meets the requirements. Freeze-dried products are exempt from this requirement.
- **pH (791)**  
Sample solution: 10.0 mg/mL of ampicillin  
Acceptance criteria: 8.0–10.0
- **WATER DETERMINATION, Method I (921):** NMT 2.0%
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **STERILITY TESTS (71):** Meets the requirements
- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.15 USP Endotoxin Units/mg of ampicillin
- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections and Implanted Drug Products (1)*, *Specific Tests*, *Completeness and clarity of solutions*.
- **OTHER REQUIREMENTS:** It meets the requirements of the tests for *Identification in Ampicillin Sodium*. It also meets the requirements in *Labeling (7)*, *Labels and Labeling for Injectable Products*.

## ADDITIONAL REQUIREMENTS

### Change to read:

- **PACKAGING AND STORAGE:** Preserve as described in *•Packaging and Storage Requirements (659)*, *Injection Packaging, Packaging for constitution* (CN 1-May-2017). Protect the constituted solution from freezing.
- **USP REFERENCE STANDARDS (11)**  
USP Ampicillin RS  
USP Ampicillin Sodium RS  
USP Endotoxin RS

## Ampicillin Soluble Powder

» Ampicillin Soluble Powder is a dry mixture of Ampicillin (as the trihydrate) and one or more suitable diluents and stabilizing agents. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin ( $\text{C}_{16}\text{H}_{19}\text{N}_3\text{O}_4\text{S}$ ).

**Packaging and storage—**Preserve in tight containers.

**Labeling—**Label it to indicate that it is for veterinary use only.

### USP Reference standards (11)—

USP Ampicillin RS

**Identification—**Dissolve a quantity of it in a mixture of acetone and 0.1 N hydrochloric acid (4:1) to obtain a solution containing 10 mg of ampicillin per mL: the resulting

solution responds to the *Identification* test under *Ampicillin Capsules*.

**pH (791):** between 3.5 and 6.0, in an aqueous solution containing the equivalent of 20 mg of ampicillin per mL.

**Water Determination, Method I (921):** not more than 5.0%.

### Assay—

**Standard preparation—**Prepare as directed for *Standard Preparation under Iodometric Assay—Antibiotics (425)*, using USP Ampicillin RS.

**Assay preparation—**Transfer an accurately weighed quantity of Soluble Powder, equivalent to about 125 mg of ampicillin, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Procedure—**Proceed as directed for *Procedure under Iodometric Assay—Antibiotics (425)*. Calculate the quantity, in mg, of ampicillin ( $\text{C}_{16}\text{H}_{19}\text{N}_3\text{O}_4\text{S}$ ) in the portion of Soluble Powder taken by the formula:

$$(F/20)(B - I).$$

## Ampicillin for Injectable Suspension

» Ampicillin for Injectable Suspension is a dry mixture of ampicillin trihydrate and one or more suitable buffers, preservatives, stabilizers, and suspending agents. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin ( $\text{C}_{16}\text{H}_{19}\text{N}_3\text{O}_4\text{S}$ ).

### Change to read:

**Packaging and storage—**Preserve as described in *•Packaging and Storage Requirements (659)*, *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

### USP Reference standards (11)—

USP Ampicillin RS

USP Endotoxin RS

**Identification—**Dissolve a quantity in a mixture of acetone and 0.1 N hydrochloric acid (4:1) to obtain a solution containing 5 mg of ampicillin per mL: the resulting solution responds to the *Identification* test under *Ampicillin Capsules*.

**Bacterial Endotoxins Test (85)—**It contains not more than 0.15 Endotoxin Unit per mg of ampicillin.

**pH (791):** between 5.0 and 7.0, in the suspension constituted as directed in the labeling.

**Water Determination, Method I (921):** between 11.4% and 14.0%.

**Sterility Tests (71)—**It meets the requirements when tested as directed for *Antibiotic Solids, Bults, and Blends* in the section *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except to use *Fluid D*, to which has been added sufficient sterile penicillinase to inactivate the ampicillin and to swirl the vessel until solution is complete before filtering. If it does not dissolve completely, proceed as directed for *Solids* in the section *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, except to use *Fluid Thioglycollate Medium* and *Soybean-Casein Digest Medium* containing sufficient penicillinase to inactivate the ampicillin in each vessel.

**Other requirements—**It meets the requirements for *Uniformity of Dosage Units (905)*, and for *Labeling (7)*, *Labels and Labeling for Injectable Products*.

**Assay—**

**Phosphate buffer solution**—Accurately weigh 68 g of monobasic potassium phosphate, and transfer to a 500-mL volumetric flask. Dissolve in and dilute with water to volume.

**Mobile phase**—Prepare a suitable mixture of water, acetonitrile, *Phosphate buffer solution*, and glacial acetic acid (3600:360:40:4). Pass through a 0.45- $\mu$ m nylon filter, and degas.

**Standard preparation**—Dissolve, with sonication, an accurately weighed quantity of USP Ampicillin RS in water to prepare a solution having 0.5 mg per mL. Pass through a 0.45- $\mu$ m PTFE filter, discarding the first 3 mL of the filtrate.

**Caffeine solution**—Transfer about 30 mg of caffeine, accurately weighed, to a 50-mL volumetric flask. Add 25 mL of water, sonicate to dissolve, and dilute with water to volume. Pass through a 0.45- $\mu$ m PTFE filter, discarding the first 3 mL of the filtrate.

**System suitability solution**—Prepare a solution of 1.0 mL of *Caffeine solution* and 9.0 mL of *Standard preparation*, and mix.

**Assay preparation**—Quantitatively dilute an accurately measured volume of Ampicillin for Injectable Suspension, constituted as directed in the labeling, with water to obtain a solution containing about 0.5 mg per mL. Pass through a 0.45- $\mu$ m PTFE filter, discarding the first 3 mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm analytical column that contains 10- $\mu$ m packing L1. The flow rate is about 2.0 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the order of elution is ampicillin followed by caffeine; the resolution, *R*, between ampicillin and caffeine is greater than 2; the column efficiency is not less than 2000 theoretical plates for the ampicillin peak; the tailing factor is not greater than 1.4; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in each mL of the constituted solution of Ampicillin for Injectable Suspension taken by the formula:

$$CD(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ampicillin RS in the *Standard preparation*; *D* is the dilution factor used in preparing the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the average peak responses of the ampicillin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ampicillin for Oral Suspension

**DEFINITION**

Ampicillin for Oral Suspension contains an amount of Ampicillin (anhydrous or as the trihydrate) equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ), when constituted as directed. It contains one or more suitable buffers, colors, flavors, preservatives, and sweetening ingredients.

**IDENTIFICATION**• **A. THIN-LAYER CHROMATOGRAPHY**

**Diluent**: Acetone and 0.1 N hydrochloric acid (4:1)

**Standard solution**: 5 mg/mL of USP Ampicillin RS in *Diluent*

**Sample solution**: Nominally 5 mg/mL of ampicillin in *Diluent*

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode**: TLC

**Adsorbent**: 0.25-mm layer of chromatographic silica gel mixture

**Application volume**: 2  $\mu$ L

**Developing solvent system**: Acetone, toluene, glacial acetic acid, and water (650:100:25:100)

**Spray reagent**: 3 mg/mL of ninhydrin in alcohol

**Analysis**

**Samples**: *Standard solution* and *Sample solution*

Apply the *Standard solution* and the *Sample solution* to the plate, and develop the chromatogram in the *Developing solvent system*. When the solvent front has moved about three-fourths of the length of the plate, remove the plate from the chamber, mark the solvent front, and allow to air-dry. Locate the spots on the plate by spraying lightly with *Spray reagent*, and dry at 90° for 15 min.

**Acceptance criteria**: The *R<sub>f</sub>* value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

**ASSAY**• **PROCEDURE**

**Standard solution**: Prepare as directed for *Standard preparation* in *Iodometric Assay—Antibiotics* <425>, using USP Ampicillin RS.

**Sample solution**: Nominally 1.25 mg/mL of ampicillin prepared as follows. Dilute a suitable aliquot of Ampicillin for Oral Suspension, constituted as directed in the labeling, freshly mixed and free from air bubbles, with water.

**Analysis**: Proceed as directed for *Iodometric Assay—Antibiotics* <425>, *Procedure*.

Calculate the percentage of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the portion of Ampicillin for Oral Suspension taken:

$$\text{Result} = (B - I) \times F \times (1/C_U) \times 100$$

*B* = volume of 0.01 N sodium thiosulfate consumed in the *Blank Determination* (mL)

*I* = volume of 0.01 N sodium thiosulfate consumed in the *Inactivation and Titration* (mL)

*F* = factor as calculated in *Iodometric Assay—Antibiotics* <425>

*C<sub>U</sub>* = nominal concentration of ampicillin in the *Sample solution* (mg/mL)

**Acceptance criteria**: 90.0%–120.0%

**PERFORMANCE TESTS**

• **DELIVERABLE VOLUME** (698): Meets the requirements

• **UNIFORMITY OF DOSAGE UNITS** (905)

For single-unit containers

**Acceptance criteria**: Meets the requirements

**SPECIFIC TESTS**

• **pH** (791)

**Sample solution**: Constitute as directed in the labeling.

**Acceptance criteria**: 5.0–7.5

• **WATER DETERMINATION, Method I** (921): NMT 2.5% where the solid for Oral Suspension contains anhydrous ampicillin or NMT 5.0% if it contains ampicillin trihydrate and the equivalent of 100 mg/mL of ampicillin when constituted as directed in the labeling

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label to indicate whether the ampicillin therein is in the anhydrous form or is the trihydrate.
- **USP REFERENCE STANDARDS (11)**  
USP Ampicillin RS

**Ampicillin Tablets****DEFINITION**

Ampicillin Tablets contain an amount of Ampicillin (anhydrous form or trihydrate form) equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

**IDENTIFICATION**• **A. THIN-LAYER CHROMATOGRAPHY**

**Diluent:** Acetone and 0.1 N hydrochloric acid (4:1)  
**Standard solution:** 5 mg/mL of USP Ampicillin RS in Diluent

**Sample solution:** 5 mg/mL of ampicillin from powdered Tablets in Diluent

**Chromatographic system**

(See Chromatography (621), Thin-Layer Chromatography.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 2  $\mu$ L

**Developing solvent system:** Acetone, toluene, glacial acetic acid, and water (650:100:25:100)

**Spray reagent:** 3 mg/mL of ninhydrin in alcohol

**Analysis**

**Samples:** Standard solution and Sample solution

Apply the Standard solution and the Sample solution to the plate, and develop the chromatogram using the Developing solvent system. When the solvent front has moved about three-fourths of the length of the plate, remove the plate from the chamber, mark the solvent front, and allow to air-dry. Locate the spots on the plate by spraying lightly with the Spray reagent, and dry at 90° for 15 min.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the Sample solution corresponds to that of the Standard solution.

**ASSAY**• **PROCEDURE**

**Standard solution:** Prepare as directed for Standard Preparation in Iodometric Assay—Antibiotics (425), using USP Ampicillin RS.

**Sample solution:** Place NLT 5 Tablets in a high-speed glass blender jar containing an accurately measured volume of water, and blend for  $4 \pm 1$  min. Dilute a suitable aliquot with water to obtain a concentration of 1.25 mg/mL of ampicillin.

**Analysis**

**Samples:** Standard solution and Sample solution  
Proceed as directed for Procedure in Iodometric Assay—Antibiotics (425).

Calculate the percentage of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the portion of Tablets taken:

$$\text{Result} = (B - I) \times (F_1/2) \times (1/C_U) \times F_2 \times 100$$

- $B$  = volume of 0.01 N sodium thiosulfate consumed in the Blank Determination (mL)  
 $I$  = volume of 0.01 N sodium thiosulfate consumed in the Inactivation and Titration of the Sample solution (mL)  
 $F_1$  = factor as calculated in Iodometric Assay—Antibiotics (425)

$C_U$  = nominal concentration of ampicillin in the Sample solution (mg/mL)

$F_2$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

**PERFORMANCE TESTS**• **DISSOLUTION, Procedure for a Pooled Sample (711)**

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Standard solution:** L/900 mg/mL of USP Ampicillin RS in water, where L is the labeled amount of ampicillin in mg/Tablet

**Sample solution:** Use a filtered portion of the solution under test.

**Solution A:** 1 in 1000 solution of polyoxyethylene (23) lauryl ether in water

**Solution B:** Dissolve 20 g of hydroxylamine hydrochloride in 5 mL of Solution A, and add water to make 1000 mL.

**Buffer:** 26 mg/mL of sodium hydroxide and 3.1 mg/mL of sodium acetate in water

**Ferric nitrate solution:** Suspend 233 g of ferric nitrate in about 600 mL of water, add 2.8 mL of sulfuric acid, stir until the ferric nitrate is dissolved, add 1 mL of polyoxyethylene (23) lauryl ether, dilute with water to 1000 mL, and mix.

**Apparatus:** Automatic analyzer consisting of (1) a liquid sampler, (2) a proportioning pump, (3) suitable spectrophotometers equipped with matched flow cells and analysis capability at 480 nm, (4) a means of recording spectrophotometric readings, and/or computer for data retrieval and calculation, and (5) a manifold consisting of the components illustrated in Figure 1.

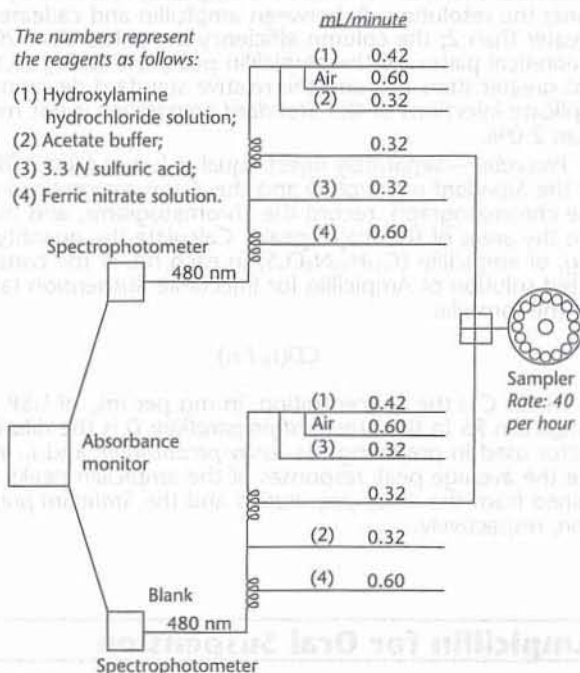

Figure 1

**Analysis**

**Samples:** Standard solution and Sample solution

With the sample line pumping water, the other lines pumping their respective reagents, and the spectrophotometer set at 480 nm, standardize the system until a steady absorbance baseline has been established. Transfer portions of the Standard solution and the Sample solution to sampler cups, and place in the sampler. Start the sampler, and conduct determinations of the Standard solution and the Sample solution

typically at the rate of 40/h using a ratio of about 2:1 for sample and wash time.  
Calculate the percentage of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times P \times F \times (1/L) \times 100$$

- $A_U$  = response of the *Sample solution*  
 $A_S$  = response of the *Standard solution*  
 $C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)  
 $V$  = volume of medium, 900 mL  
 $P$  = potency of ampicillin in USP Ampicillin RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$   
 $L$  = label claim (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921)**

Type of Tablets	Form of Ampicillin	Limit (%)
Nonchewable	Anhydrous	NMT 4.0
Nonchewable	Trihydrate	9.5–12.0
Chewable	Anhydrous	NMT 3.0
Chewable	Trihydrate	NMT 5.0
Tablets labeled for veterinary use only	Trihydrate	NMT 13.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Label the Tablets to indicate whether the ampicillin therein is in the anhydrous form or is the trihydrate. Label chewable Tablets to indicate that they are to be chewed before swallowing. Tablets intended for veterinary use only are so labeled.
- **USP REFERENCE STANDARDS (11)**  
USP Ampicillin RS

### Ampicillin and Probenecid for Oral Suspension

» Ampicillin and Probenecid for Oral Suspension contains an amount of Ampicillin (as the trihydrate) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of probenecid ( $C_{13}H_{19}NO_4S$ ). It contains one or more suitable colors, flavors, and suspending agents.

**Packaging and storage—**Preserve in tight, unit-dose containers.

#### USP Reference standards (11)—

USP Ampicillin RS  
USP Probenecid RS

#### Uniformity of dosage units (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements for *Content Uniformity* with respect to ampicillin and probenecid.

**Deliverable volume (698):** meets the requirements.

**pH (791):** between 5.0 and 7.5, in the suspension constituted as directed in the labeling.

**Water Determination, Method I (921):** not more than 5.0%.

#### Assay for ampicillin—

**Standard preparation—**Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics (425)*, using USP Ampicillin RS.

**Assay preparation—**Constitute Ampicillin and Probenecid for Oral Suspension as directed in the labeling, and mix. Transfer the resulting suspension to a high-speed glass blender jar containing sufficient water to make 500.0 mL, and blend for about 10 minutes. Quantitatively dilute an accurately measured volume of this stock solution with water to obtain an *Assay preparation* containing about 1.25 mg of ampicillin per mL.

**Procedure—**Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics (425)*. Calculate the quantity, in mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the Ampicillin and Probenecid for Oral Suspension taken by the formula:

$$(L/D)(F/2000)(B-I)$$

in which  $L$  is the labeled quantity, in mg, of ampicillin in the Ampicillin and Probenecid for Oral Suspension; and  $D$  is the concentration, in mg per mL, of ampicillin in the *Assay preparation* on the basis of the labeled quantity in the Ampicillin and Probenecid for Oral Suspension and the extent of dilution.

#### Assay for probenecid—

**Standard preparation—**Dissolve an accurately weighed portion of USP Probenecid RS in sodium carbonate solution (1 in 100) to obtain a solution having a known concentration of about 1 mg per mL.

**Assay preparation—**Constitute Ampicillin and Probenecid for Oral Suspension as directed in the labeling, and mix. Quantitatively dilute the resulting suspension with sodium carbonate solution (1 in 100) to obtain a solution containing about 1 mg of probenecid per mL, mix, and filter.

**Procedure—**Transfer 2.0 mL of the clear *Assay preparation* to a 125-mL separator, and add 8.0 mL of 1.0 N hydrochloric acid. Extract this solution with four 20-mL portions of chloroform, filtering each extract through a glass wool pledget and 6 g of chloroform-washed anhydrous sodium sulfate into a 100-mL volumetric flask. Wash the pledget and the sodium sulfate with chloroform, collecting the washings in the 100-mL volumetric flask, dilute with chloroform to volume, and mix. Treat 2.0 mL of the *Standard preparation* in the same manner. Concomitantly determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 257 nm, with a suitable spectrophotometer, using chloroform washed with sodium carbonate solution (1 in 100) as the blank. Calculate the quantity, in mg, of probenecid ( $C_{13}H_{19}NO_4S$ ) in the Ampicillin and Probenecid for Oral Suspension taken by the formula:

$$C(L/D)(A_U/A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Probenecid RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of probenecid in the Ampicillin and Probenecid for Oral Suspension;  $D$  is the concentration, in mg per mL, of probenecid in the *Assay preparation* on the basis of the labeled quantity in the Ampicillin and Probenecid for Oral Suspension and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Ampicillin Sodium

$C_{16}H_{18}N_3NaO_4S$  371.39

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, [6-(aminophenylacetyl)amino]-3,3-dimethyl-7-oxo-, monosodium salt, [2*S*-(2*α*,5*α*,6*β*(*S*\*))]-;

Monosodium *D*-(−)-6-(2-amino-2-phenylacetamido)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [69-52-3].

### DEFINITION

Ampicillin Sodium has a potency equivalent to NLT 845 μg and NMT 988 μg of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) per mg, calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. IDENTIFICATION TESTS—GENERAL**, Sodium (191)

### ASSAY

#### • PROCEDURE

**Diluent:** Water, 1 M monobasic potassium phosphate, and 1 N acetic acid (989:10:1)

**Mobile phase:** Acetonitrile, water, 1 M monobasic potassium phosphate, and 1 N acetic acid (80:909:10:1)

**Standard solution:** 1 mg/mL of USP Ampicillin RS in *Diluent* using shaking and sonication, if necessary, to dissolve. Use this solution promptly after preparation.

**System suitability solution:** 0.12 mg/mL of caffeine in *Standard solution*

**Sample solution:** [NOTE—Ampicillin Sodium is hygroscopic. Minimize exposure to the atmosphere, and weigh promptly.] Equivalent to 1 mg/mL of anhydrous ampicillin in *Diluent*. [NOTE—Use this solution promptly after preparation.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column**

**Pre-column:** 4-mm × 5-cm; 5- to 10-μm packing L1

**Analytical column:** 4-mm × 30-cm; 5- to 10-μm packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20 μL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ampicillin and caffeine are 0.5 and 1.0, respectively, *System suitability solution*.]

#### Suitability requirements

**Resolution:** NLT 2.0 between the caffeine and the ampicillin peaks, *System suitability solution*

**Tailing factor:** NMT 1.4, *Standard solution*

**Capacity factor:** NMT 2.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in μg, of  $C_{16}H_{19}N_3O_4S$  in each mg of Ampicillin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Ampicillin Sodium in the *Sample solution* (mg/mL)

$P$  = potency of USP Ampicillin RS (μg/mg)

Acceptance criteria: 845–988 μg/mg on the anhydrous basis

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE 1: LIMIT OF METHYLENE CHLORIDE

**Internal standard solution:** 2.1 mg/mL of dioxane in dimethyl sulfoxide

**Standard solution:** 0.33 mg/mL of methylene chloride in *Internal standard solution*

**Sample solution:** 166.7 mg/mL of Ampicillin Sodium in *Internal standard solution*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 1.8-m × 4-mm glass column packed with a 10% phase G39 on unsilanized support S1A

**Temperature**

**Column:** 65°

**Injector:** 100°

**Detector block:** 260°

**Carrier gas:** Nitrogen

**Flow rate:** 60 mL/min

**Injection size:** 1 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for methylene chloride and dioxane are 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 4 between methylene chloride and dioxane

**Relative standard deviation:** NMT 5%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of methylene chloride in the portion of Ampicillin Sodium taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of methylene chloride to dioxane from the *Sample solution*

$R_S$  = peak response ratio of methylene chloride to dioxane from the *Standard solution*

$C_S$  = concentration of methylene chloride in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Ampicillin Sodium in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.2%.

- **PROCEDURE 2: DIMETHYLANILINE** (223): Meets the requirement

### SPECIFIC TESTS

- **CRYSTALLINITY** (695): Meets the requirements. [NOTE—Ampicillin Sodium in the freeze-dried form is exempt from this requirement.]

- **PH** (791): 8.0–10.0

**Sample solution:** 10.0 mg/mL of ampicillin

- **WATER DETERMINATION**, *Method I* (921): NMT 2.0%

- **STERILITY TESTS** (71): Where the label states that Ampicillin Sodium is sterile, it meets the requirements.

- **BACTERIAL ENDOTOXINS TEST** (85): Where the label states that Ampicillin Sodium is sterile or the label states that Ampicillin Sodium must be subjected to further processing during the processing of injectable dosage forms, it contains NMT 0.15 USP Endotoxin Unit/mg of ampicillin.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

• **USP REFERENCE STANDARDS** (11)

USP Ampicillin RS  
USP Ampicillin Sodium RS  
USP Endotoxin RS

## Ampicillin and Sulbactam for Injection

» Ampicillin and Sulbactam for Injection is a sterile, dry mixture of Ampicillin Sodium and Sulbactam Sodium. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) and sulbactam ( $C_8H_{11}NO_5S$ ), the labeled amounts representing proportions of ampicillin to sulbactam of 2:1. It contains not less than 563  $\mu$ g of ampicillin and 280  $\mu$ g of sulbactam per mg, calculated on the anhydrous basis.

### Change to read:

**Packaging and storage**—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

### USP Reference standards (11)—

USP Ampicillin RS  
USP Endotoxin RS  
USP Sulbactam RS

**Constituted solution**—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial Endotoxins Test** (85)—It contains not more than 0.17 USP Endotoxin Unit in a portion equivalent to 1 mg of a mixture of ampicillin and sulbactam (0.67 and 0.33 mg, respectively).

**Sterility Tests** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 8.0 and 10.0, in a solution containing 10 mg of ampicillin and 5 mg of sulbactam per mL.

**Water Determination, Method I** (921): not more than 2.0%.

**Particulate Matter in Injections** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* (7), *Labels and Labeling for Injectable Products*.

### Assay—

0.005 M Tetrabutylammonium hydroxide—Dilute 6.6 mL of a 40% solution of tetrabutylammonium hydroxide with water to obtain 1800 mL of solution. Adjust with 1 M phosphoric acid to a pH of  $5.0 \pm 0.1$ , dilute with water to 2000 mL, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of 0.005 M Tetrabutylammonium hydroxide and acetonitrile (1650:350). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard preparation*—Quantitatively dissolve accurately weighed quantities of USP Ampicillin RS and USP Sulbactam RS in *Mobile phase* to obtain a solution having known con-

centrations of about 0.6 mg of ampicillin per mL and 0.3 mg of sulbactam per mL. [NOTE—Inject this solution promptly.]

*Resolution solution*—Prepare a solution of USP Sulbactam RS in 0.01 N sodium hydroxide containing 0.3 mg per mL, and allow to stand for 30 minutes. Adjust with phosphoric acid to a pH of  $5.0 \pm 0.1$ . Transfer 5 mL of the solution to a 25-mL volumetric flask, add 4.25 mL of acetonitrile, dilute with 0.005 M Tetrabutylammonium hydroxide to volume, and mix. Transfer 1 mL of this solution to a second 25-mL volumetric flask, add 15 mg of USP Ampicillin RS, dilute with *Mobile phase* to volume, and mix. [NOTE—Inject this solution promptly.]

*Assay preparation 1*—Mix the contents of a container of Ampicillin and Sulbactam for Injection. Quantitatively dissolve an accurately weighed portion of the powder in *Mobile phase* to obtain a solution having a concentration of about 1 mg of the powder per mL. [NOTE—Inject this solution promptly.]

*Assay preparation 2* (where it is represented as being in a single-dose container)—Constitute a container of Ampicillin and Sulbactam for Injection with a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw the total withdrawable contents from the container, using a suitable hypodermic needle and syringe, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.6 mg of ampicillin per mL and 0.3 mg of sulbactam per mL. [NOTE—Inject this solution promptly.]

*Assay preparation 3* (where the label states the quantities of ampicillin and sulbactam in a given volume of constituted solution)—Constitute a container of Ampicillin and Sulbactam for Injection with a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.6 mg of ampicillin per mL and 0.3 mg of sulbactam per mL. [NOTE—Inject this solution promptly.]

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4-mm  $\times$  30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.7 for ampicillin and 1.0 for sulbactam alkaline degradation product; and the resolution,  $R$ , between ampicillin and sulbactam alkaline degradation product is not less than 4.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative retention times are about 0.35 for ampicillin and 1.0 for sulbactam; the column efficiency determined from the sulbactam peak is not less than 3500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the appropriate *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities, in  $\mu$ g, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) and of sulbactam ( $C_8H_{11}NO_5S$ ) in the portion of Ampicillin and Sulbactam for Injection taken by the same formula:

$$(C_s P / C_u)(r_u / r_s)$$

in which  $C_s$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*;  $P$  is the assigned content, in  $\mu$ g per mg, of the appropriate USP Reference Standard;  $C_u$  is the concentration, in mg per mL, of Ampicillin and Sulbactam for Injection in *Assay preparation 1*, based on the weight, in mg, of powder removed from the container and the extent of dilution; and  $r_u$  and  $r_s$  are the peak areas for the appropriate analyte ob-

tained from *Assay preparation 1* and the *Standard preparation*, respectively. Calculate the quantities of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) and of sulbactam ( $C_8H_{11}NO_5S$ ) withdrawn from the container, or in the volume of constituted solution taken by the same formula:

$$(L / D)(C_s P)(r_u / r_s)$$

in which *L* is the labeled quantity, in mg, of ampicillin or sulbactam, as appropriate, in the container or in the volume of constituted solution taken; *D* is the concentration, in mg per mL, of ampicillin or sulbactam in *Assay preparation 2* or *Assay preparation 3*, on the basis of the labeled quantity, in mg, of ampicillin or sulbactam, as appropriate, in the container and the extent of dilution; *r<sub>u</sub>* and *r<sub>s</sub>* are the peak areas for the appropriate analyte obtained from *Assay preparation 2* or *Assay preparation 3* and the *Standard preparation*, respectively; and the other terms are as defined above.

## Ampromium

Cl<sup>-</sup> · HCl

$C_{14}H_{19}ClN_4 \cdot HCl$  315.24  
1-[(4-Amino-2-propyl-5-pyrimidinyl)methyl]-2-methylpyridinium chloride monohydrochloride;  
1-[(4-Amino-2-propyl-5-pyrimidinyl)methyl]-2-picolinium chloride monohydrochloride [137-88-2].

### DEFINITION

Ampromium contains NLT 97.0% and NMT 101.0% of ampromium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)  
Sample: Previously dried  
Acceptance criteria: Meets the requirements
- **B. ULTRAVIOLET ABSORPTION** (197U)  
Analytical wavelength: 246 nm  
Sample solution: 10 µg/mL in 0.1 N hydrochloric acid  
Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

### ASSAY

- **PROCEDURE**  
Diluent: Methanol, acetonitrile, and water (45:5:50)  
Mobile phase: 6 g of sodium 1-heptanesulfonate in 500 mL of water. Add 12 mL of glacial acetic acid, 2.0 mL of triethylamine, 450 mL of methanol, and 50 mL of acetonitrile. Pass through a suitable filter of 0.5-µm or finer pore size.  
System suitability solution: 0.5 mg/mL of USP Ampromium RS and 0.2 mg/mL of 2-picoline in Diluent  
Standard solution: 0.5 mg/mL of USP Ampromium RS in Diluent  
Sample solution: 0.5 mg/mL of Ampromium in Diluent  
**Chromatographic system**  
(See Chromatography (621), System Suitability.)  
Mode: LC  
Detector: UV 254 nm  
Column: 4.6-mm × 25-cm; packing L13  
Flow rate: 0.6 mL/min  
Injection volume: 10 µL  
**System suitability**  
Sample: System suitability solution  
Suitability requirements  
Resolution: NLT 7 between ampromium and 2-picoline

**Column efficiency:** NLT 6500 theoretical plates from the ampromium peak

**Tailing factor:** NMT 2.3 for the ampromium peak

**Relative standard deviation:** NMT 1.0% for ampromium

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of ampromium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ) in the portion of Ampromium taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times 100$$

*r<sub>u</sub>* = peak response from the Sample solution

*r<sub>s</sub>* = peak response from the Standard solution

*C<sub>s</sub>* = concentration of USP Ampromium RS in the Standard solution (mg/mL)

*C<sub>u</sub>* = concentration of Ampromium in the Sample solution (mg/mL)

**Acceptance criteria:** 97.0%–101.0% on the dried basis

### SPECIFIC TESTS

#### • LOSS ON DRYING (731)

**Analysis:** Dry a sample at a pressure not exceeding 5 mm of mercury at 100° for 3 h.

**Acceptance criteria:** NMT 1.0%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS** (11)  
USP Ampromium RS

## Ampromium Soluble Powder

### DEFINITION

Ampromium Soluble Powder contains NLT 95.0% and NMT 105.0% of the labeled amount of ampromium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ).

### IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION** (197U)  
Sample solution: 10 µg/mL (filtered) in 0.1 N hydrochloric acid  
Acceptance criteria: Meets the requirements

### ASSAY

- **PROCEDURE**  
Diluent: Methanol, acetonitrile, and water (45:5:50)  
Mobile phase: 6 g of sodium 1-heptanesulfonate in 500 mL of water. Add 12 mL of glacial acetic acid, 2.0 mL of triethylamine, 450 mL of methanol, and 50 mL of acetonitrile. Pass through a suitable filter of 0.5-µm or finer pore size.  
System suitability solution: 0.5 mg/mL of USP Ampromium RS and 0.2 mg/mL of 2-picoline in Diluent  
Standard solution: 0.5 mg/mL of USP Ampromium RS in Diluent  
Sample solution: Nominally 0.5 mg/mL of ampromium in Diluent, prepared as follows. Transfer a portion of Soluble Powder, equivalent to 50 mg of ampromium, to a 100-mL volumetric flask, add 75 mL of Diluent, and sonicate for 10 min. Allow to cool to room temperature, and dilute with Diluent to volume. Pass through a suitable filter of 0.5-µm or finer pore size, and use the clear filtrate.  
**Chromatographic system**  
(See Chromatography (621), System Suitability.)

Mode: LC  
 Detector: UV 254 nm  
 Column: 4.6-mm × 25-cm; packing L13  
 Flow rate: 0.6 mL/min  
 Injection volume: 10 µL

#### System suitability

Sample: *System suitability solution*

#### Suitability requirements

Resolution: NLT 7 between amprolium and 2-picoline

Column efficiency: NLT 6500 theoretical plates from the amprolium peak

Tailing factor: NMT 2.3 for the amprolium peak

Relative standard deviation: NMT 1.0% for amprolium

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ) in the portion of Soluble Powder taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Amprolium RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of amprolium in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS (11)**  
USP Amprolium RS

### Amprolium Oral Solution

» Amprolium Oral Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, protected from light. Store at a temperature between 5° and 30°, in a dry place.

**Labeling**—Label it to indicate that it is for veterinary use only.

#### USP Reference standards (11)—

USP Amprolium RS

#### Identification, Ultraviolet Absorption (197U)—

*Solution:* 10 µg per mL, filtered.

*Medium:* 0.1 N hydrochloric acid.

**pH** (791): between 2.5 and 3.0.

#### Assay—

*Mobile phase*—To 4.5 g of sodium 1-hexanesulfonate add 1500 mL of water, 400 mL of methanol, and 100 mL of acetonitrile, mix, and allow to cool to room temperature. Adjust with phosphoric acid to a pH of 5.1, and pass through a filter having a 0.5-µm or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Quantitatively dissolve an accurately weighed quantity of USP Amprolium RS in water to obtain a solution having a known concentration of about 0.5 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 960 mg of amprolium, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this stock solution to a second 100-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 268-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The column is maintained at a constant temperature of about 45°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for amprolium. Calculate the quantity, in mg, of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ) in each mL of the Oral Solution taken by the formula:

$$(2000C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Amprolium RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the amprolium peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Amyl Nitrite

$C_5H_{11}NO_2$  117.15

Mixture of nitrous acid, 2-methylbutyl ester, and nitrous acid, 3-methylbutyl ester [8017-89-8; 110-46-3].

» Amyl Nitrite is a mixture of the nitrite esters of 3-methyl-1-butanol and 2-methyl-1-butanol. It contains not less than 85.0 percent and not more than 103.0 percent of  $C_5H_{11}NO_2$ .

**Caution**—Amyl Nitrite is very flammable. Do not use where it may be ignited.

**Packaging and storage**—Preserve in tight containers, and store in a cool place, protected from light.

#### USP Reference standards (11)—

USP Benzyl Benzoate RS

#### Identification—

**A:** The NMR spectrum recorded as directed in the *Assay* exhibits, among other peaks, a doublet with a band centered at about 1 ppm and a multiplet with a band centered at about 4.8 ppm representing methyl protons and methylene protons alpha to the nitrite group, respectively, both relative to the tetramethylsilane singlet at 0 ppm.

**B:** To a few drops of it add a mixture of 1 mL of ferrous sulfate TS and 5 mL of 3 N hydrochloric acid: a greenish brown color is produced.

**Specific gravity** (841): between 0.870 and 0.876.

**Acidity**—To 0.30 mL in a glass-stoppered cylinder add a mixture of 0.60 mL of 0.1 N sodium hydroxide, 10 mL of water, and 1 drop of phenolphthalein TS, and invert the cylinder three times: the red tint of the water layer is still perceptible.

**Limit of nonvolatile residue**—Allow 10 mL to evaporate at room temperature in a tared evaporating dish, in a well-ventilated hood, and dry the residue at 105° for 1 hour: the weight of the residue does not exceed 2 mg (0.02%).

**Content of total nitrites**—Inject a portion of Amyl Nitrite of suitable volume, but not more than 2  $\mu$ L, into a suitable gas chromatograph (see *Chromatography* (621)) equipped with a thermal conductivity detector. Under typical conditions, the instrument contains a 3-mm  $\times$  2-m column packed with a methyl polysiloxane oil, 25% by weight on suitable calcined diatomite, the column is maintained at about 80°, the injection port and detector block are maintained about 10° above the temperature of the column, and helium is used as a carrier gas at a flow rate of about 60 mL per minute. From the area under the curve, calculate the percentage (a/a) of total nitrites, represented by the area under the main peak of the chromatogram, in the Amyl Nitrite taken: not less than 97.0% is found.

#### Assay—

**Solvent:** carbon tetrachloride.

**Internal standard**—USP Benzyl Benzoate RS.

**Procedure**—Transfer 4 to 5 mEq of *Internal standard*, accurately weighed, to a semimicro sampling tube, add 2 to 3 mL of carbon tetrachloride, apply a sampling valve and septum,\* thereby sealing the tube, and determine the weight of the sealed assembly. Open the valve, introduce about 500  $\mu$ L of Amyl Nitrite with a syringe, close the valve, and determine the weight of the sealed assembly when it has attained constant weight. Shake the sampling tube and valve assembly, and transfer about 500  $\mu$ L of the solution to a precision NMR tube as directed for *Absolute Method of Quantitation* under *Nuclear Magnetic Resonance* (761). With no spinning, or with the spinning adjusted so that the spinning side bands of neither the substance under assay nor the *Internal standard* interfere with the regions to be integrated, record as  $A_5$  the average area of the *Internal standard* singlet appearing at about 5.3 ppm, representing the methylene protons of benzyl benzoate, and record as  $A_U$  the average area of the multiplet with a band center at about 4.8 ppm, representing the alpha methylene protons of amyl nitrite, with reference to the tetramethylsilane singlet at 0 ppm. Calculate the quantity of  $C_5H_{11}NO_2$  in the Amyl Nitrite taken, using 58.57 as the equivalent weight of amyl nitrite ( $EW_U$ ) and 106.12 as that of benzyl benzoate ( $EW_5$ ).

### Amyl Nitrite Inhalant

» Amyl Nitrite Inhalant contains a mixture of the nitrite esters of 3-methyl-1-butanol and 2-methyl-1-butanol. It contains not less than 80.0 percent and not more than 105.0 percent of  $C_5H_{11}NO_2$ . It contains a suitable stabilizer.

**Caution**—Amyl Nitrite Inhalant is very flammable. Do not use where it may be ignited.

**Packaging and storage**—Preserve in tight, unit-dose glass containers, wrapped loosely in gauze or other suitable material, and store in a cool place, protected from light.

**USP Reference standards** (11)—

USP Benzyl Benzoate RS

**Specific gravity** (841): between 0.870 and 0.880.

**Content of total nitrites**—Remove the gauze or other covering, place the glass container of Inhalant upright in a dry ice-acetone slurry, and cool for 10 minutes. Dry the container of Inhalant, place it in a pointed glass tube, and break the container with a glass rod. Proceed as directed for *Total nitrites* under *Amyl Nitrite*: not less than 95.0% is found.

\* Suitable sampling tubes, sampling valves, and septums are available, respectively, as catalog Nos. K-749000, K-749100, and K-749102 (50 septums) or K-749101 (100 septums), from Kontes Glass Company, Vineland, NJ 08360.

**Other requirements**—It responds to the *Identification* tests and meets the requirements of the test for *Acidity* under *Amyl Nitrite*.

#### Assay—

**Solvent:** carbon tetrachloride.

**Internal standard**—USP Benzyl Benzoate RS.

**Procedure**—Remove the gauze or other covering from 1 or more Inhalant ampuls containing a total of 300 to 400  $\mu$ L of amyl nitrite. Weigh accurately the clean and dry intact glass ampul(s), and place the weighed specimen in a freezer for not less than 15 minutes. Transfer the chilled specimen to a glass-stoppered, 25-mL conical flask containing a solution of 4 to 5 mEq of *Internal standard*, accurately weighed, in 1 to 2 mL of carbon tetrachloride. Break the ampul(s) with a glass rod, and rinse any sample or glass fragments adhering to the glass rod with 1 mL of carbon tetrachloride into the main assay solution. Insert the stopper in the flask immediately, mix, and proceed as directed for *Absolute Method of Quantitation* under *Nuclear Magnetic Resonance* (761), beginning with "When dissolution has been completed." With no spinning, or with the spinning adjusted so that the spinning side bands of neither the substance under assay nor the *Internal standard* interfere with the regions to be integrated, record as  $A_5$  the average area of the *Internal standard* singlet appearing at about 5.3 ppm, representing the methylene protons of benzyl benzoate, and record as  $A_U$  the average area of the multiplet with a band center at about 4.8 ppm, representing the alpha methylene protons of amyl nitrite, with reference to the tetramethylsilane singlet at 0 ppm. Calculate the quantity of  $C_5H_{11}NO_2$  in the Inhalant taken, using 58.57 as the equivalent weight of amyl nitrite ( $EW_U$ ) and 106.12 as that of benzyl benzoate ( $EW_5$ ). Rinse the flask containing the assay preparation with three 5-mL portions of ether, decanting each rinsing carefully to avoid loss of glass fragments, and evaporate any remaining ether with the aid of a current of dry air. Transfer the dry glass fragments to a tared watch glass, weigh, and subtract the weight of the glass fragments from that of the intact ampul(s) to obtain the weight of the Inhalant taken.

### Anagrelide Hydrochloride

$C_{10}H_7Cl_2N_3O \cdot HCl \cdot H_2O$

Anhydrous

310.56

292.55

[58579-51-4].

Imidazo[2,1-*b*]quinazolin-2(3*H*)-one, 6,7-dichloro-1,5-dihydro-, monohydrochloride, monohydrate;  
6,7-Dichloro-1,5-dihydroimidazo[2,1-*b*]quinazolin-2(3*H*)-one monohydrochloride, monohydrate [823178-43-4].

#### DEFINITION

Anagrelide Hydrochloride contains NLT 98.0% and NMT 102.0% of anagrelide hydrochloride ( $C_{10}H_7Cl_2N_3O \cdot HCl$ ), calculated on the anhydrous basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

**ASSAY****• PROCEDURE**

Use freshly prepared standard and sample solutions and inject within 2 h.

**Solution A:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** Acetonitrile and *Solution A* (1:3)

**Diluent:** Acetonitrile and water (1:1)

**Standard stock solution:** 0.5 mg/mL of anagrelide hydrochloride in acetonitrile prepared as follows. Transfer USP Anagrelide Hydrochloride RS into a suitable volumetric flask, add a small amount of 2 N hydrochloric acid (3 drops per every 50 mL of the final volume) and acetonitrile equivalent to fill about 80% of the final volume. Sonicate to dissolve, and dilute with acetonitrile to volume.

**Standard solution:** 0.05 mg/mL of anagrelide hydrochloride in *Diluent* from *Standard stock solution*

**Sample stock solution:** Weigh Anagrelide Hydrochloride, equivalent to 25 mg of anhydrous salt, into a 50-mL volumetric flask, add 3 drops of 2 N hydrochloric acid and 40 mL of acetonitrile. Sonicate to dissolve, and dilute with acetonitrile to volume.

**Sample solution:** Transfer 5 mL of *Sample stock solution* to a 50-mL volumetric flask, and dilute with *Diluent* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 4-μm packing L11

**Flow rate:** 1.2 mL/min

**Injection volume:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 3000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of anagrelide hydrochloride ( $C_{10}H_7Cl_2N_3O \cdot HCl$ ) in the portion of Anagrelide Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response of anagrelide from the *Sample solution*

$r_s$  = peak response of anagrelide from the *Standard solution*

$C_s$  = concentration of USP Anagrelide Hydrochloride RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Anagrelide Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES**

**• RESIDUE ON IGNITION (281):** NMT 0.1%

**Delete the following:**

**• HEAVY METALS, Method II (231):** NMT 20 ppm (Official 1-

Jan-2018)

**• ORGANIC IMPURITIES**

Use freshly prepared standard and sample solutions and inject within 2 h.

**Mobile phase:** Proceed as directed in the Assay.

**Diluent A:** Use the *Diluent* as described in the Assay.

**Diluent B:** Acetonitrile and water (1:3)

**Standard stock solution A:** 0.05 mg/mL of USP Anagrelide Related Compound A RS in *Diluent A*

**Standard stock solution B:** 0.05 mg/mL of anagrelide related compound B in acetonitrile. Transfer USP Anagrelide Related Compound B RS into a suitable volumetric flask, add acetonitrile equivalent to fill about 50% of the final volume and a small amount of 2 N hydrochloric acid (3 drops per 200 mL of the final volume). Sonicate to dissolve, heat in the hot water bath if necessary, and dilute with acetonitrile to volume.

**Standard stock solution C:** 0.1 mg/mL of anagrelide hydrochloride in acetonitrile. Transfer USP Anagrelide Hydrochloride RS into a suitable volumetric flask, add acetonitrile equivalent to fill about 80% of the final volume and a small amount of 0.12 N hydrochloric acid (1 mL per 100 mL of the final volume). Sonicate to dissolve, and dilute with acetonitrile to volume.

**System suitability solution:** 0.25 μg/mL of each of anagrelide related compound A and anagrelide related compound B in *Mobile phase* from *Standard stock solution A* and *Standard stock solution B*

**Standard solution:** 0.05 μg/mL of anagrelide hydrochloride in *Mobile phase* from *Standard stock solution C*

**Sample stock solution:** Weigh Anagrelide Hydrochloride, equivalent to 25 mg of anhydrous salt, into a 50-mL volumetric flask. Add 45 mL of acetonitrile, sonicate, and swirl the flask until the preparation turns into a cloudy liquid. Add 1 drop of 0.12 N hydrochloric acid, swirl the flask until the liquid turns to clear, and dilute with acetonitrile to volume.

**Sample solution:** Transfer 5 mL of *Sample stock solution* into a 50-mL volumetric flask, and dilute with *Diluent B* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 4-μm packing L11

**Autosampler temperature:** 5°

**Flow rate:** 1.2 mL/min

**Injection volume:** 50 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between anagrelide related compound B and anagrelide related compound A, *System suitability solution*

**Column efficiency:** NLT 3000 theoretical plates, *Standard solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 10.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Anagrelide Hydrochloride, on the anhydrous basis, taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

$r_u$  = peak response of each impurity from the *Sample solution*

$r_s$  = peak response of anagrelide from the *Standard solution*

$C_s$  = concentration of USP Anagrelide Hydrochloride RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Anagrelide Hydrochloride (anhydrous) in the *Sample solution* (mg/mL)

$F$  = relative response factor for each individual impurity (see *Table 1*)

**Acceptance criteria:** See *Table 1*. Disregard any impurity peak less than 0.05%.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Anagrelide related compound B <sup>a</sup>	0.40	0.43	0.3
Anagrelide related compound A <sup>b</sup>	0.55	0.37	0.15
Anagrelide open ring methyl ester (if present) <sup>c</sup>	0.80	0.51	0.25
Anagrelide	1.00	1.0	—
Anagrelide related compound C <sup>d</sup>	1.41	0.32	0.15

**Anagrelide Capsules****DEFINITION**

Anagrelide Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of C<sub>10</sub>H<sub>7</sub>Cl<sub>2</sub>N<sub>3</sub>O.

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Solution A:** 1.0 g/L of sodium hexanesulfonate. Add 1.0 mL of phosphoric acid and filter.

**Mobile phase:** Acetonitrile and *Solution A* (7:13)

**Diluent:** Acetonitrile and water (1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anagrelide Hydrochloride RS in acetonitrile. Initially add acetonitrile (about 80% of the volume of the flask) and a small quantity of 2 N hydrochloric acid (about 0.2 mL for every 100 mL of the final volume). Sonicate to dissolve, and dilute with acetonitrile to volume.

**Standard solution:** 0.01 mg/mL of anagrelide free base in *Diluent* from *Standard stock solution*

**Sample solution:** 0.01 mg/mL of anagrelide free base prepared from the contents of NLT 20 Capsules. Add *Diluent* (80% of the volume of the flask), sonicate for

10 min, and stir for 15 min. Further dilute with *Diluent* to volume, centrifuge for 15 min at 4000 rpm, and use the supernatant for analysis.

**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 4-μm packing L11

**Column temperature:** 60°

**Flow rate:** 1.0 mL/min

**Injection size:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 3000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>14</sub>H<sub>13</sub>N<sub>5</sub>O<sub>5</sub>S<sub>2</sub>, based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of anagrelide from the *Sample solution*

$r_S$  = peak response of anagrelide from the *Standard solution*

$C_S$  = concentration of anagrelide in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of anagrelide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**• **DISSOLUTION (711)**

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 15 min

**Mobile phase:** Proceed as directed in the *Assay*.

**Standard solution:** Transfer about 30.32 mg of USP Anagrelide Hydrochloride RS, equivalent to 25.00 mg of anagrelide, to a 100-mL volumetric flask. Add about 80 mL of acetonitrile and 3 drops of 2 N hydrochloric acid. Sonicate until dissolved. Dilute with acetonitrile to volume. Dilute this solution with *Medium* to obtain a final concentration of about (L/1000) mg/mL, where L is the Capsule label claim in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 274 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L7

**Sample cooler temperature:** 5°

**Flow rate:** 1.0 mL/min

**Injection size:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 3000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

Calculate the percentage of anagrelide dissolved:

$$\text{Result} = (r_U/r_S) \times W_S(100 - W_C)/(25 \times 100) \times M_{r1}/M_{r2} \times V/L \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$W_S$  = weight of the USP Anagrelide Hydrochloride RS taken (mg)

$W_C$  = water content of the USP Anagrelide Hydrochloride RS (%)

$M_{r1}$  = molecular weight of anagrelide, 256.10  
 $M_{r2}$  = molecular weight of anagrelide hydrochloride, 292.56  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label claim (mg/Capsule)

Tolerances: NLT 80% (Q) of the labeled amount of anagrelide is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE

**Buffer solution:** 6.8 g/L of monobasic potassium phosphate. Adjust with diluted phosphoric acid to a pH of  $3.50 \pm 0.05$ . Mix well and filter.

**Mobile phase:** Acetonitrile and *Buffer solution* (27:73)  
**Diluent:** Acetonitrile:water (7:13)

**Related compound A stock solution:** 10 µg/mL of USP Anagrelide Related Compound A RS in *Diluent*

**Related compound C stock solution:** 10 µg/mL of USP Anagrelide Related Compound C RS in *Diluent*

**System suitability solution:** 0.2 µg/mL of each USP Anagrelide Related Compound A RS and USP Anagrelide Related Compound C RS and 0.02 mg/mL of USP Anagrelide Hydrochloride RS. Initially dissolve USP Anagrelide Hydrochloride RS in *Diluent* (about 80% of the volume of the flask), sonicate for 10 min, and stir for 15 min. Add appropriate amounts of *Related compound A stock solution* and *Related compound C stock solution*, and dilute with *Diluent* to volume.

**Standard stock solution:** 0.1 mg/mL of anagrelide free base by dissolving USP Anagrelide Hydrochloride RS in acetonitrile (about 80% of the volume of the flask). Add a small quantity of 2 N hydrochloric acid (about 0.2 mL for every 100 mL of the final volume), sonicate to dissolve, and dilute with acetonitrile to volume.

**Standard solution:** 0.10 µg/mL of anagrelide free base in *Diluent* from *Standard stock solution*

**Sample solution:** 0.02 mg/mL of anagrelide free base from NLT 20 Capsules. Initially add *Diluent* to about 80% of the volume of the flask, sonicate for 10 min, stir for about 15 min, and dilute with *Diluent* to volume. Centrifuge (about 4000 rpm) the solution for 15 min, and use the supernatant for analysis.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 4-µm packing L11

**Column temperature:** 45°

**Flow rate:** 1.0 mL/min

**Injection size:** 30 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between anagrelide hydrochloride and anagrelide related compound C, and between anagrelide hydrochloride and anagrelide related compound A, *System suitability solution*

**Column efficiency:** NLT 3000 theoretical plates, *Standard solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2.0% for the anagrelide peak, *Standard solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

$r_u$  = peak response of each individual impurity from the *Sample solution*

$r_s$  = peak response of anagrelide from the *Standard solution*

$C_u$  = nominal concentration of anagrelide in the *Sample solution* (mg/mL)

$C_s$  = concentration of anagrelide in the *Standard solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

**Acceptance criteria:** The individual and total impurities meet the limits in *Impurity Table 1*. [NOTE—Anagrelide related compound A (RRT = 0.86) and anagrelide related compound C (RRT = 1.15) are process related and controlled in the drug substance.]

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Anagrelide hydrochloride	1.0	—	—
Anagrelide related compound B <sup>a</sup>	0.3	0.34	1.0
Anagrelide trichloro derivative <sup>b</sup>	1.8–2.3	1.0	0.15
Any other individual impurity	—	—	0.2
Total Impurities	—	—	1.5

<sup>a</sup> [2-Amino-5,6-dichloroquinazoline-3(4*H*)-yl]acetic acid.

<sup>b</sup> 6,7,8-Trichloro-3,5-dihydroimidazo[2,1-*b*]quinazolin-2(1*H*)-one.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.

#### • USP REFERENCE STANDARDS (11)

USP Anagrelide Hydrochloride RS

USP Anagrelide Related Compound A RS

Ethyl 2-(6-amino-2,3-dichlorobenzylamino)acetate.

$C_{11}H_{14}Cl_2N_2O_2$  277.15

USP Anagrelide Related Compound C RS

Ethyl 2-(5,6-dichloro-2-imino-1,2-dihydroquinazolin-3(4*H*)-yl)acetate hydrobromide.

## Anastrozole

$C_{17}H_{19}N_5$  293.37

1,3-Benzenediacetonitrile,  $\alpha,\alpha,\alpha',\alpha'$ -tetramethyl-5-(1*H*-1,2,4-triazol-1-ylmethyl)-;

$\alpha,\alpha,\alpha',\alpha'$ -Tetramethyl-5-(1*H*-1,2,4-triazol-1-ylmethyl)-*m*-benzenediacetonitrile [120511-73-1].

## DEFINITION

Anastrozole contains NLT 98.0% and NMT 102.0% of anastrozole ( $C_{17}H_{19}N_5$ ), calculated on the anhydrous and solvent-free basis.

## IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Solution A:** Acetonitrile, methanol, trifluoroacetic acid, and water (100: 300: 0.5: 600)

**Solution B:** Acetonitrile, methanol, trifluoroacetic acid, and water (150: 450: 0.5: 400)

**Mobile phase:** See Table 1.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	100	0
40	0	100
41	100	0
56	100	0

[NOTE—These gradient elution times are established on an HPLC system with a dwell time of approximately 0 min. The gradient elution times in the table can be adjusted by subtracting the dwell time to achieve the separation described.]

**Standard solution:** 0.5 mg/mL of USP Anastrozole RS prepared as follows. Transfer USP Anastrozole RS into a suitable volumetric flask. Dissolve in acetonitrile, using 40% of the final volume, and then dilute with *Solution A* to volume.

**Sample solution:** 0.5 mg/mL of Anastrozole prepared as follows. Transfer 25 mg of Anastrozole to a 50-mL volumetric flask, add 20 mL of acetonitrile to dissolve. Dilute with *Solution A* to volume.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 3.2-mm × 10-cm; 5-μm packing L42

**Flow rate:** 0.75 mL/min

**Injection volume:** 10 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** Between 0.9 and 1.4

**Relative standard deviation:** NMT 0.73%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of anastrozole (C<sub>17</sub>H<sub>19</sub>N<sub>3</sub>) in the portion of Anastrozole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of anastrozole from the *Sample solution*

$r_S$  = peak area of anastrozole from the *Standard solution*

$C_S$  = concentration of USP Anastrozole RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Anastrozole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous and solvent-free basis

**IMPURITIES**

- RESIDUE ON IGNITION** <281>: NMT 0.1%

**Delete the following:**

- HEAVY METALS, Method II** <231>: NMT 10 ppm (Official 1-Jan-2018)

**• ORGANIC IMPURITIES**

**Solution A, Solution B, and Chromatographic system:** Proceed as directed in the Assay.

**Standard stock solution:** 0.2 mg/mL of USP Anastrozole RS prepared as follows. Dissolve in acetonitrile,

using 40% of the final volume, and then dilute with *Solution A* to volume.

**Standard solution:** 0.02 mg/mL of USP Anastrozole RS in *Solution A* from the *Standard stock solution*

**Sample solution:** 2 mg/mL of Anastrozole prepared as follows. Transfer 50 mg of Anastrozole to a 25-mL volumetric flask. Add 10 mL of acetonitrile. Dissolve in and dilute with *Solution A* to volume.

**Blank solution:** Transfer 10 mL of acetonitrile into a 25-mL volumetric flask, and dilute with *Solution A* to volume.

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** Between 0.9 and 1.4

**Relative standard deviation:** NMT 5%

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Blank solution*. [NOTE—Adjust the peak areas for any interference from the *Blank solution*.]

Calculate the percentage of each individual impurity in the portion of Anastrozole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of each individual impurity from the *Sample solution*

$r_S$  = peak area of anastrozole from the *Standard solution*

$C_S$  = concentration of USP Anastrozole RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Anastrozole in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 2. Disregard any impurity of less than 0.05%.

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Desmethyl anastrozole <sup>a</sup>	0.6	0.2
Anastrozole	1.0	—
Anastrozole dimer <sup>b</sup>	2.0	0.2
5-Bromomethyl anastrozole <sup>c</sup>	4.3	0.1
5-Dibromomethyl anastrozole <sup>d</sup>	5.4	0.1
Individual unspecified impurity	—	0.1
Total impurities	—	0.5

<sup>a</sup> 2-(3-(1-Cyanoethyl)-5-(1H-1,2,4-triazol-1-ylmethyl)phenyl)-2-methylpropionitrile.

<sup>b</sup> 2,3-Bis(3-(1-cyano-1-methylethyl)-5-(1H-1,2,4-triazol-1-ylmethyl)phenyl)-2-methylpropionitrile.

<sup>c</sup> 2,2'-(5-(Bromomethyl)-1,3-phenylene)bis(2-methylpropionitrile).

<sup>d</sup> 2,2'-(5-(Dibromomethyl)-1,3-phenylene)bis(2-methylpropionitrile).

**SPECIFIC TESTS**

- WATER DETERMINATION, Method Ic** <921>: NMT 0.3%

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

- USP REFERENCE STANDARDS (11)**  
USP Anastrozole RS

**Anastrozole Tablets****DEFINITION**

Anastrozole Tablets contain NLT 90% and NMT 110% of the labeled amount of anastrozole (C<sub>17</sub>H<sub>19</sub>N<sub>3</sub>).

**IDENTIFICATION**• **A. INFRARED ABSORPTION (17K)**

**Sample:** Transfer the finely ground Tablet powder containing 8 mg of anastrozole into a suitable container. Add 10 mL of diethyl ether and sonicate for 5 min. Aspirate the supernatant and pass the slurry through a nylon filter of 0.45- $\mu$ m pore size into another suitable container containing 400 mg of spectroscopic grade potassium bromide. Evaporate the mixture to dryness under nitrogen. Further dry it under vacuum at 50° for 1 h.

**Acceptance criteria:** Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Acetonitrile and water (40:60)

**Diluent:** Acetonitrile and water (50:50)

**Standard solution:** 40  $\mu$ g/mL of USP Anastrozole RS in *Diluent*. Sonication may be used to aid dissolution.

**Sample solution:** Nominally equivalent to 40  $\mu$ g/mL of anastrozole in *Diluent*, prepared as follows. Transfer NLT 10 Tablets to a suitable volumetric flask. Add 40% of the flask volume of water, and shake on a rotary shaker for 10 min to disintegrate the Tablets. Add 40% of the flask volume of acetonitrile, and sonicate for 15 min with intermittent shaking, maintaining the sonicator temperature at 25°. Dilute with *Diluent* to volume. Centrifuge a portion of the solution at 3500 rpm for 10 min, and use the clear solution for analysis.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of anastrozole ( $C_{17}H_{19}N_5$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Anastrozole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of anastrozole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90%–110%

**PERFORMANCE TESTS**• **DISSOLUTION (711)****Test 1**

**Medium:** Water; 900 mL, deaerated

**Apparatus 2:** 50 rpm

**Time:** 15 min

**Mobile phase:** Acetonitrile and water (40:60)

**Diluent:** Acetonitrile and water (50:50)

**Standard stock solution:** 0.2 mg/mL of USP Anastrozole RS in *Diluent*

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of (L/1000) mg/mL, where L is the label claim in mg/Tablet.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size. Discard the first few mL of the filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Calculate the percentage of the labeled amount of anastrozole ( $C_{17}H_{19}N_5$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 1000 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of anastrozole (C<sub>17</sub>H<sub>19</sub>N<sub>3</sub>) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Solution A:** Methanol, acetonitrile, trifluoroacetic acid, and water (200: 100: 0.7: 700)

**Solution B:** Methanol, acetonitrile, trifluoroacetic acid, and water (500: 250: 0.7: 250)

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
25	100	0
25.1	0	100
30	0	100
31	100	0
40	100	0

**Diluent:** Acetonitrile, trifluoroacetic acid, and water (200: 0.8: 800)

**System suitability stock solution:** 0.5 mg/mL of USP Anastrozole RS and 0.3 mg/mL of ethyl 4-hydroxybenzoate in *Diluent* prepared as follows. Transfer USP Anastrozole RS and ethyl 4-hydroxybenzoate into a suitable volumetric flask and add *Diluent* equivalent to 50% of the final volume. Sonicate to dissolve and dilute with *Diluent* to volume.

**System suitability solution:** 10 µg/mL of USP Anastrozole RS and 6 µg/mL of ethyl 4-hydroxybenzoate in *Diluent*, from *System suitability stock solution*

**Standard stock solution:** 0.5 mg/mL of USP Anastrozole RS in *Diluent* prepared as follows. Transfer USP Anastrozole RS into a suitable volumetric flask and add *Diluent* equivalent to 50% of the final volume. Sonicate to dissolve and dilute with *Diluent* to volume.

**Standard solution:** 10 µg/mL of USP Anastrozole RS in *Diluent*, from *Standard stock solution*

**Sample solution:** Nominally equivalent to 1.0 mg/mL of anastrozole from NLT 25 finely powdered Tablets, prepared as follows. Transfer a weighed quantity of powdered Tablets, equivalent to 10 mg of anastrozole, to a suitable container and add 10.0 mL of *Diluent*. Sonicate for 30 min and allow to cool to room temperature. Pass through a suitable filter of 0.45-µm pore size, and discard the first few mL of the filtrate. If the filtrate is not clear, pass again through a suitable filter of 0.2-µm pore size, and discard the first few mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 3.2-mm × 10-cm; 5-µm packing L42

**Flow rate:** 1.0 mL/min

**Injection volume:** 10 µL

**Analysis time:** 25 min

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for ethyl 4-hydroxybenzoate and anastrozole are 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** Greater than 4 between ethyl 4-hydroxybenzoate and anastrozole peaks

**Tailing factor:** 0.9–1.3, for the anastrozole peak

**Relative standard deviation:** NMT 5%, for the anastrozole peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of anastrozole from the *Standard solution*

$C_S$  = concentration of USP Anastrozole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of anastrozole in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 2. Disregard any impurity peak less than 0.1%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Anastrozole diamide <sup>a</sup>	0.11	0.5
Anastrozole monoacid monoamide <sup>b</sup>	0.26	0.5
Anastrozole monoamide mononitrile <sup>c</sup>	0.30	0.5
Desmethyl anastrozole <sup>d</sup>	0.51	—
Anastrozole diacid <sup>e</sup>	0.71	0.5
Anastrozole monoacid mononitrile <sup>f</sup>	0.87	0.5
Anastrozole	1.00	—
Any individual unspecified impurity	—	0.5
Total impurities	—	1.0

<sup>a</sup> 2,2'-(5-[(1H-1,2,4-Triazol-1-yl)methyl]-1,3-phenylene)bis(2-methylpropanamide).

<sup>b</sup> 2-{3-[(1H-1,2,4-Triazol-1-yl)methyl]-5-(1-amino-2-methyl-1-oxopropan-2-yl)phenyl}-2-methylpropanoic acid.

<sup>c</sup> 2-{3-[(1H-1,2,4-Triazol-1-yl)methyl]-5-(2-cyanopropan-2-yl)phenyl}-2-methylpropanamide.

<sup>d</sup> 2-(3-(1-Cyanoethyl)-5-(1H-1,2,4-triazol-1-yl)methyl)phenyl)-2-methylpropanenitrile. This process impurity is controlled in the drug substance monograph. It is included in the table for identification only, and it is not to be reported in the *Total impurities*.

<sup>e</sup> 2,2'-(5-[(1H-1,2,4-Triazol-1-yl)methyl]-1,3-phenylene)bis(2-methylpropanoic acid).

<sup>f</sup> 2-{3-[(1H-1,2,4-Triazol-1-yl)methyl]-5-(2-cyanopropan-2-yl)phenyl}-2-methylpropanoic acid.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**  
USP Anastrozole RS

## Anileridine

C<sub>22</sub>H<sub>28</sub>N<sub>2</sub>O<sub>2</sub>

352.47

4-Piperidinecarboxylic acid, 1-[2-(4-aminophenyl)ethyl]-4-phenyl-, ethyl ester;  
Ethyl 1-(*p*-aminophenethyl)-4-phenylisonipecotatate  
[144-14-9].

**DEFINITION**

Anileridine contains NLT 98.5% and NMT 101.0% of anileridine ( $C_{22}H_{28}N_2O_2$ ), calculated on the anhydrous basis.

**IDENTIFICATION**• **A.**

**Buffer solution:** Dissolve 5.68 g of anhydrous dibasic sodium phosphate and 3.63 g of monobasic potassium phosphate in water to make 1000 mL; the pH is 7.0  $\pm$  0.05.

**Sample stock solution:** Dissolve 40 mg of Anileridine in 2.3 mL of 0.1 N hydrochloric acid in a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution A:** *Sample stock solution, Buffer solution, and water (4:25:71)*

**Sample solution B:** *Sample stock solution, Buffer solution, and water (20:25:55)*

**Acceptance criteria:** The UV absorption spectrum of *Sample solution A* exhibits a maximum at 234  $\pm$  1 nm; and the UV absorption spectrum of *Sample solution B* exhibits a maximum at 285  $\pm$  2 nm. The ratio  $5A_{234}/A_{285}$  is 8.8.

• **B.**

**Sample solution:** 0.2 mg/mL of Anileridine in 0.1 N hydrochloric acid

**Analysis:** To 5 mL of the *Sample solution* add 2 mL of a solution of *p*-dimethylaminobenzaldehyde in alcohol (1 in 100).

**Acceptance criteria:** A yellow color develops immediately.

**ASSAY**• **PROCEDURE**

**Sample:** 350 mg of Anileridine

**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with *Titrant* to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 17.62 mg of anileridine ( $C_{22}H_{28}N_2O_2$ ).

**Acceptance criteria:** 98.5%–101.0% on the anhydrous basis

**IMPURITIES**

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **CHLORIDE AND SULFATE, Chloride** (221)

**Sample:** 180 mg

**Analysis:** Dissolve the *Sample* in a mixture of 1 mL of nitric acid and 40 mL of water.

**Acceptance criteria:** NMT 400 ppm; the solution shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid.

**SPECIFIC TESTS**

• **WATER DETERMINATION, Method I** (921): NMT 1.0%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.

**Anileridine Injection****DEFINITION**

Anileridine Injection is a sterile solution of Anileridine in Water for Injection, prepared with the aid of Phosphoric Acid. It contains NLT 90.0% and NMT 115.0% of the labeled amount of anileridine ( $C_{22}H_{28}N_2O_2$ ), as the phosphate.

**IDENTIFICATION**• **A.**

**Sample solution:** 0.25 mg/mL of anileridine from Injection diluted with water

**Analysis:** To 5 mL of the *Sample solution* add 2 mL of a 10-mg/mL solution of *p*-dimethylaminobenzaldehyde in alcohol.

**Acceptance criteria:** A yellow color develops immediately.

• **B.** A volume of Injection, diluted with water to a concentration of 0.025 mg/mL of anileridine, exhibits absorbance maxima at 234  $\pm$  1 and 285  $\pm$  2 nm.

**ASSAY**• **PROCEDURE**

**Standard solution:** Prepare 250  $\mu$ g/mL of USP Anileridine Hydrochloride RS in 0.1 N hydrochloric acid on the day of the assay. Each mg of anileridine hydrochloride is equivalent to 0.8286 mg of anileridine.

**Sample solution:** Nominally equivalent to 200  $\mu$ g/mL of anileridine, from a volume of Injection diluted with 0.1 N hydrochloric acid

**Blank:** 0.1 N hydrochloric acid

**Instrumental conditions**

**Analytical wavelength:** 560 nm

**Cell:** 1 cm

**Analysis**

**Samples:** *Standard solution, Sample solution, and Blank*  
Transfer 5.0 mL each of the *Standard solution, Sample solution, and Blank* to separate 200-mL volumetric flasks. To each flask add 25 mL of water, 5 mL of 1 N hydrochloric acid, and 5 mL of 1-mg/mL sodium nitrite solution. Allow to stand for 2 min, then add to each flask 5 mL of 5-mg/mL ammonium sulfamate solution. Allow to stand for 3 min, then add 5 mL of 1-mg/mL *N*-(1-naphthyl)ethylenediamine dihydrochloride solution. Allow to stand for 1 h, and dilute with water to volume. Use the reagent blank to set the instrument.

Calculate the percentage of anileridine ( $C_{22}H_{28}N_2O_2$ ) in the volume of Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Anileridine Hydrochloride RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of anileridine in the *Sample solution* ( $\mu$ g/mL)

$M_{r1}$  = molecular weight of anileridine, 352.48

$M_{r2}$  = molecular weight of anileridine hydrochloride, 425.40

**Acceptance criteria:** 90.0%–115.0%

**SPECIFIC TESTS**

• **pH** (791): 4.5–5.0

• **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 7.2 USP Endotoxin Units/mg of anileridine.

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.
- **USP REFERENCE STANDARDS (11)**  
USP Anileridine Hydrochloride RS  
USP Endotoxin RS

**Anileridine Hydrochloride**

$C_{22}H_{28}N_2O_2 \cdot 2HCl$  425.39  
4-Piperidinecarboxylic acid, 1-[2-(4-aminophenyl)ethyl]-4-phenyl-, ethyl ester, dihydrochloride;  
Ethyl 1-(*p*-aminophenethyl)-4-phenylisopropylate dihydrochloride [126-12-5].

**DEFINITION**

Anileridine Hydrochloride contains NLT 96.0% and NMT 102.0% of anileridine hydrochloride ( $C_{22}H_{28}N_2O_2 \cdot 2HCl$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**

• **B.**

**Buffer solution:** 5.68 g/L of anhydrous dibasic sodium phosphate and 3.63 g/L of monobasic potassium phosphate in water: the pH, determined potentiometrically, is  $7.0 \pm 0.05$ .

**Sample stock solution:** 0.5 mg/mL of anileridine hydrochloride in water

**Sample solution A:** *Sample stock solution*, pH 7.0 *buffer solution*, and water (4:25:71)

**Sample solution B:** *Sample stock solution*, pH 7.0 *buffer solution*, and water (20:25:55)

**Acceptance criteria:** The UV absorption spectrum of *Sample solution A* exhibits a maximum at  $234 \pm 1$  nm, and the UV absorption spectrum of *Sample solution B* exhibits a maximum at  $285 \pm 2$  nm.

• **C.**

**Sample solution:** 0.2 mg/mL of Anileridine Hydrochloride

**Analysis:** To 5 mL of the *Sample solution* add 2 mL of a solution of 10 mg/mL of *p*-dimethylaminobenzaldehyde in alcohol.

**Acceptance criteria:** A yellow color develops immediately.

- **D. IDENTIFICATION TESTS—GENERAL, Chloride (191)**

**Sample:** 10-mg/mL solution of Anileridine Hydrochloride

**Acceptance criteria:** Meets the requirements

**ASSAY**• **PROCEDURE**

**Sample:** 200 mg of Anileridine Hydrochloride  
**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in 10 mL of glacial acetic acid by heating it on a steam bath. Cool immediately in a cold water bath, add 5 mL of mercuric acetate TS, 20 mL of acetone, and 0.5 mL of indicator solution (70 mg of  $\alpha$ -naphtholbenzein, 10 mg of crystal violet, and 40 mg of quinaldine red in 100 mL of glacial acetic acid). Titrate with *Titrant* to a gray-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 21.27 mg of anileridine hydrochloride ( $C_{22}H_{28}N_2O_2 \cdot 2HCl$ ).

**Acceptance criteria:** 96.0%–102.0% on the dried basis

**OTHER COMPONENTS**• **CONTENT OF CHLORIDE**

**Sample:** 200 mg

**Analysis:** Dissolve the *Sample* in 50 mL of water in a glass-stoppered flask. Add 25.0 mL of 0.1 N silver nitrate VS, then add 5 mL of 2 N nitric acid and 5 mL of nitrobenzene, shake vigorously, and add 2 mL of ferric ammonium sulfate TS. Titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl.

**Acceptance criteria:** 16.0%–17.2%

**IMPURITIES**

- **RESIDUE ON IGNITION (281):** NMT 0.1%

**SPECIFIC TESTS**• **PH (791)**

**Sample solution:** 50 mg/mL

**Acceptance criteria:** 2.5–3.0

• **LOSS ON DRYING (731)**

**Analysis:** Dry a sample at a pressure below 5 mm of mercury at 100° for 2 h.

**Acceptance criteria:** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Anileridine Hydrochloride RS

**Anileridine Hydrochloride Tablets****DEFINITION**

Anileridine Hydrochloride Tablets contain an amount of anileridine hydrochloride ( $C_{22}H_{28}N_2O_2 \cdot 2HCl$ ) equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of anileridine ( $C_{22}H_{28}N_2O_2$ ).

**IDENTIFICATION**• **A.**

**Sample solution:** Transfer an equivalent to 50 mg of anileridine, from finely powdered Tablets, to a 250-mL volumetric flask. Add 100 mL of water, and heat on a steam bath. Cool, dilute to volume, and filter.

**Analysis:** To 5 mL of the *Sample solution* add 2 mL of a 10-mg/mL solution of *p*-dimethylaminobenzaldehyde in alcohol.

**Acceptance criteria:** A yellow color develops immediately.

• **B.**

**Buffer solution:** 5.68 g/L of anhydrous dibasic sodium phosphate and 3.63 g/L of monobasic potassium phosphate in water: the pH, determined potentiometrically, is  $7.0 \pm 0.05$ .

**Sample stock solution:** Transfer an equivalent to 50 mg of anileridine, from finely powdered Tablets, to a 100-mL volumetric flask. Add 30 mL of water, and heat on a steam bath. Cool, dilute with water to volume, and filter.

**Sample solution A:** *Sample stock solution*, *Buffer solution*, and water (4:25:71)

**Sample solution B:** *Sample stock solution*, *Buffer solution*, and water (20:25:55)

**Acceptance criteria:** The UV absorption spectrum of *Sample solution A* exhibits a maximum at  $234 \pm 1$  nm, and the UV absorption spectrum of *Sample solution B* exhibits a maximum at  $285 \pm 2$  nm.

**ASSAY****• PROCEDURE**

**Standard solution:** 250 µg/mL of USP Anileridine Hydrochloride RS in 0.1 N hydrochloric acid. (Each mg of anileridine hydrochloride is equivalent to 0.8286 mg of anileridine.) Prepare on the day of the assay.

**Sample solution:** Transfer an equivalent to 50 mg of anileridine, from finely powdered Tablets (NLT 20), to a 250-mL volumetric flask. Add 25 mL of 1 N hydrochloric acid and 100 mL of water, and heat on a water bath. Cool, and dilute with water to volume. Filter the solution, discarding the first 25 mL of the filtrate.

**Blank:** 0.1 N hydrochloric acid

**Instrumental conditions**

**Analytical wavelength:** 560 nm

**Cell:** 1 cm

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Blank* Transfer 5.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* to separate 200-mL volumetric flasks. To each flask add 25 mL of water, 5 mL of 1 N hydrochloric acid, and 5 mL of 1-mg/mL sodium nitrite solution. Allow to stand for 2 min, then add to each flask 5 mL of 5-mg/mL ammonium sulfamate solution. Allow to stand for 3 min, then add 5 mL of 1-mg/mL *N*-(1-naphthyl)ethylenediamine dihydrochloride solution. Allow to stand for 1 h, and dilute with water to volume. Use the reagent blank to set the instrument.

Calculate the percentage of anileridine ( $C_{22}H_{28}N_2O_2$ ) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$	= absorbance of the solution from the <i>Sample solution</i>
$A_S$	= absorbance of the solution from the <i>Standard solution</i>
$C_S$	= concentration of USP Anileridine Hydrochloride RS in the <i>Standard solution</i> (µg/mL)
$C_U$	= nominal concentration of anileridine in the <i>Sample solution</i> (µg/mL)
$M_{r1}$	= molecular weight of anileridine, 352.48
$M_{r2}$	= molecular weight of anileridine hydrochloride, 425.40

**Acceptance criteria:** 95.0%–105.0%

**PERFORMANCE TESTS****• DISSOLUTION (711)**

**Medium:** 0.01 N hydrochloric acid; 900 mL

1,8-Dihydroxy-9-anthrone [1143-38-0].

## DEFINITION

Anthralin contains NLT 97.0% and NMT 102.0% of anthralin (C<sub>14</sub>H<sub>10</sub>O<sub>3</sub>), calculated on the dried basis.

## IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

• **B. ULTRAVIOLET ABSORPTION (197U)**

**Sample solution:** 10 µg/mL in chloroform

**Acceptance criteria:** Meets the requirements

## ASSAY

### • PROCEDURE

[NOTE—Use low-actinic glassware.]

**Mobile phase:** *n*-Hexane, dichloromethane, and glacial acetic acid (82:12:6)

**Internal standard solution:** 0.5 mg/mL of *o*-nitroaniline in *n*-hexane prepared as follows. First dissolve *o*-nitroaniline in a small quantity of dichloromethane, and then dilute with *n*-hexane.

**System suitability stock solution:** 0.1 mg/mL of USP Anthralin RS and 0.2 mg/mL of danthron in dichloromethane

**System suitability solution:** Transfer 5 mL of the *System suitability stock solution* into a 25-mL volumetric flask, add 5 mL of *n*-hexane, and dilute with *Mobile phase* to volume.

**Solvent blank solution:** *Mobile phase*, *n*-hexane, and dichloromethane (3:1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anthralin RS in dichloromethane

**Standard solution:** Transfer 5 mL each of *Standard stock solution* and *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample stock solution:** 0.25 mg/mL of Anthralin in dichloromethane

**Sample solution:** Transfer 5 mL each of *Sample stock solution* and *Internal standard solution* into a 25-mL volumetric flask, dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 354 nm

**Column:** 4.6-mm × 25-cm; packing L3

**Flow rate:** 2 mL/min

**Injection volume:** 10 µL

#### System suitability

**Samples:** *System suitability solution*, *Solvent blank solution*, and *Standard solution*

[NOTE—The relative retention times for anthralin, danthron, dianthrone, and o-nitroaniline are 1.0, 1.2, 1.7, and 2.3, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.3 between anthralin and danthron, *System suitability solution*

**Tailing factor:** NMT 1.5, *System suitability solution*

**Relative standard deviation:** NMT 2.0% of the ratio of the peak responses, *Standard solution*

**Interference:** No discernible signal is observed at the retention time of anthralin, *Solvent blank solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of anthralin ( $C_{14}H_{10}O_3$ ) in the portion of Anthralin taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of anthralin to o-nitroaniline from the *Sample solution*

$R_S$  = peak response ratio of anthralin to o-nitroaniline from the *Standard solution*

$C_S$  = concentration of USP Anthralin RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Anthralin in the *Sample solution* (µg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

#### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **CHLORIDE AND SULFATE, Chloride** (221)

**Sample:** 1 g

**Analysis:** To 15 mL of water add the *Sample*, mix, and filter. Acidify 5 mL of the filtrate with nitric acid, and add a few drops of silver nitrate TS.

**Acceptance criteria:** No more opalescence is produced immediately than is present in a 5-mL portion of the filtrate to which nothing has been added.

• **CHLORIDE AND SULFATE, Sulfate** (221)

**Sample:** 5 mL of the untreated filtrate obtained in the test for *Chloride*

**Analysis:** To the *Sample* add 3 drops of 3 N hydrochloric acid and 5 drops of barium chloride TS.

**Acceptance criteria:** No more turbidity is produced than is present in a 5-mL portion of the filtrate to which nothing has been added.

#### SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE, Class I** (741): 178°–181°

• **LOSS ON DRYING** (731)

**Analysis:** Dry a sample over silica gel for 4 h.

**Acceptance criteria:** NMT 0.5%

• **ACIDITY OR ALKALINITY**

**Analysis:** Suspend a sample in water, and filter.

**Acceptance criteria:** The filtrate is neutral to litmus.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers in a cool place. Protect from light.

• **USP REFERENCE STANDARDS** (11)

USP Anthralin RS

## Anthralin Cream

#### DEFINITION

Anthralin Cream is Anthralin in an aqueous (oil-in-water) or oily (water-in-oil) cream vehicle. Cream labeled to contain more than 0.1% of anthralin contains NLT 90.0% and NMT 115.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ), and Cream labeled to contain 0.1% or less of anthralin contains NLT 90.0% and NMT 130.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ).

#### ASSAY

##### • PROCEDURE

[NOTE—Use low-actinic glassware.]

**Mobile phase:** *n*-Hexane, dichloromethane, and glacial acetic acid (82:12:6)

**Internal standard solution:** 0.5 mg/mL of o-nitroaniline in *n*-hexane prepared as follows. First dissolve o-nitroaniline in a small quantity of dichloromethane, and then dilute with *n*-hexane.

**System suitability stock solution:** 0.1 mg/mL of USP Anthralin RS and 0.2 mg/mL of danthron in dichloromethane

**System suitability solution:** Transfer 5 mL of the *System suitability stock solution* into a 25-mL volumetric flask, add 5 mL of *n*-hexane, and dilute with *Mobile phase* to volume.

**Solvent blank solution:** *Mobile phase*, *n*-hexane, and dichloromethane (3:1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anthralin RS in dichloromethane

**Standard solution:** Transfer 2 mL each of *Standard stock solution* and *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample stock solution:** Weigh 5 g of Cream into a 100-mL beaker. Add 20 mL of dichloromethane and 10 mL of glacial acetic acid, and stir to disperse the Cream. Transfer the contents of the beaker to a filter paper (Whatman No. 4, or equivalent) with the aid of dichloromethane, and filter into a 100-mL volumetric flask. Thoroughly wash the precipitate with dichloromethane, and allow the washings to drain into the flask. Dilute with dichloromethane to volume.

**Sample solution:** Transfer a volume of *Sample stock solution* equivalent to 0.5 mg of anthralin and 2 mL of *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 354 nm

**Column:** 4.6-mm × 25-cm; packing L3

**Flow rate:** 2 mL/min

**Injection volume:** 10 µL

#### System suitability

**Samples:** *System suitability solution*, *Solvent blank solution*, and *Standard solution*

[NOTE—The relative retention times for anthralin, danthron, dianthrone, and *o*-nitroaniline are 1.0, 1.2, 1.7, and 2.3, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.3 between anthralin and danthron, *System suitability solution*

**Tailing factor:** NMT 1.5, *System suitability solution*

**Relative standard deviation:** NMT 2.0% of the ratio of the peak responses, *Standard solution*

**Interference:** No discernible signal is observed at the retention time of anthralin, *Solvent blank solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of anthralin ( $C_{14}H_{10}O_3$ ) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of anthralin to *o*-nitroaniline from the *Sample solution*

$R_S$  = peak response ratio of anthralin to *o*-nitroaniline peak from the *Standard solution*

$C_S$  = concentration of USP Anthralin RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of anthralin in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–115.0% for Cream labeled to contain more than 0.1% of anthralin;  
90.0%–130.0% for Cream labeled to contain 0.1% or less of anthralin

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, in a cool place. Protect from light.
- **LABELING:** Label it to indicate whether the cream vehicle is aqueous or oily.
- **USP REFERENCE STANDARDS** <11>  
USP Anthralin RS

### Anthralin Ointment

#### DEFINITION

Anthralin Ointment is Anthralin in a petrolatum or other oleaginous vehicle. Ointment labeled to contain more than 0.1% of anthralin contains NLT 90.0% and NMT 115.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ), and Ointment labeled to contain 0.1% or less of anthralin contains NLT 90.0% and NMT 130.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ).

#### ASSAY

##### • PROCEDURE

[NOTE—Use low-actinic glassware.]

**Mobile phase:** *n*-Hexane, dichloromethane, and glacial acetic acid (82:12:6)

**Internal standard solution:** 0.5 mg/mL of *o*-nitroaniline in *n*-hexane prepared as follows. First dissolve *o*-nitroaniline in a small quantity of dichloromethane, and then dilute with *n*-hexane.

**System suitability stock solution:** 0.1 mg/mL of USP Anthralin RS and 0.2 mg/mL of danthron in dichloromethane

**System suitability solution:** Transfer 5 mL of the *System suitability stock solution* into a 25-mL volumetric flask, add 5 mL of *n*-hexane, and dilute with *Mobile phase* to volume.

**Solvent blank solution:** *Mobile phase*, *n*-hexane, and dichloromethane (3:1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anthralin RS in dichloromethane

**Standard solution:** Transfer 2 mL each of *Standard stock solution* and *Internal standard solution* into a

25-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample stock solution:** Weigh 5 g of Ointment into a 100-mL beaker. Add 20 mL of dichloromethane and 10 mL of glacial acetic acid, and stir to disperse the Ointment. Transfer the contents of the beaker to a filter paper (Whatman No. 4, or equivalent) with the aid of dichloromethane, and filter into a 100-mL volumetric flask. Thoroughly wash the precipitate with dichloromethane, and allow the washings to drain into the flask. Dilute with dichloromethane to volume.

**Sample solution:** Transfer a volume of *Sample stock solution* equivalent to 0.5 mg of anthralin and 2 mL of *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

USP Anthralin RS

### Anthrax Vaccine Adsorbed

#### DEFINITION

Anthrax Vaccine Adsorbed is a sterile, milky-white suspension made from cell-free filtrates of microaerophilic cultures of an avirulent, nonencapsulated strain of *Bacillus anthracis*. The final product contains no dead or live bacteria. The production cultures are grown in a chemically defined protein-free medium containing amino acids, vitamins, inorganic salts, and sugars. The sterile filtrate is ad-

sorbed on sterile aluminum hydroxide, concentrated 10-fold, and resuspended in sterile physiological saline containing formaldehyde with benzethonium chloride as a preservative. Sublots may be combined to produce final lots. The product meets potency requirements when tested against the U.S. Reference Standard Anthrax Vaccine, in accordance with approved procedures (guinea pig intracutaneous challenge models).

## IDENTIFICATION

### • A.

[NOTE—Perform analysis on the filtrate.]

**Trichloroacetic acid solution:** Prepare a solution of trichloroacetic acid (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water containing 100 g of trichloroacetic acid per 100 mL of the solution.

**Sample buffer:** Prepare a solution containing 141 mM tris(hydroxymethyl)aminomethane, 106 mM tris(hydroxymethyl)aminomethane hydrochloride, 0.51 mM edetate disodium, 2% (w/v) dodecyl lithium sulfate, 10% (v/v) glycerol, 0.22 mM Coomassie blue G-250, and 0.175 mM phenolsulfonphthalein. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.5.

**Running buffer:** Prepare a solution containing 25 mM tris(hydroxymethyl)aminomethane, 192 mM glycine, and 0.1% (w/v) dodecyl sodium sulfate (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.5.

**Transblotting buffer:** Prepare a solution containing 12.5 mM tris(hydroxymethyl)aminomethane, 96 mM glycine, and 10% (v/v) methanol. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.0.

**Blocking buffer:** Prepare a solution containing 10 mM monobasic sodium phosphate, 150 mM sodium chloride, 5% (w/v) nonfat dry milk, and 0.05% (w/v) polysorbate 20. Adjust with sodium hydroxide to a pH of 7.4.

**Primary antibody solutions:** Prepare suitable monoclonal antibodies raised against the protective antigen (PA), the lethal factor (LF), and the edema factor (EF), respectively, of *Bacillus anthracis* in murine ascites cells, harvested, and used without further purification. Immediately before use, dilute each of the murine ascites fluids containing the monoclonal antibodies (1:1000) with the *Blocking buffer*.

**Secondary antibody solution:** Immediately before use, dissolve according to the manufacturer's instructions, if necessary, and dilute the stock horseradish peroxidase conjugated to goat anti-mouse IgG solution (1:1000) with *Blocking buffer*.

**Chromogenic visualization solution:** 150 mg/mL of 4-chloro-1-naphthol in water

**Sample solution:** Use anthrax vaccine filtrate as is.

**Analysis:** In a suitable centrifuge tube transfer (30/c) mL of the *Sample solution*, where *c* is the total protein concentration, in  $\mu\text{g/mL}$ , of the solution as determined in the test for *Total Protein*. Add  $16.5/c$  mL of *Trichloroacetic acid solution*, and incubate for at least 10 min. Centrifuge at  $9000 \times g$  for about 10 min, decant off the supernatant, and hold the tube inverted to drain on a filter paper. Dissolve the pellet in 60  $\mu\text{L}$  of *Sample buffer*, and transfer the solution to a polypropylene microfuge tube that has a lid. Close the lid tightly, secure with a lid-lock, and heat at  $100^\circ$  for 5 min. Allow the solution to cool to room temperature, and centrifuge at  $10,000 \times g$  for 15 s to collect the liquids. In a suitable device for polyacrylamide-gel electrophoresis (see *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* (1056)), add appropriate volumes of the *Running buffer* in the upper and the lower buffer chambers. Attach a 4%–20% gradient tris-glycine polyacrylamide slab gel sandwiched between two glass plates,

such that the wells for sample application are exposed to the *Running buffer* in the upper buffer chamber. Apply about 20- $\mu\text{L}$  aliquots of the treated *Sample solution* in three alternate lanes. [NOTE—Do not apply any solution in the outside lanes.] Connect the lower buffer chamber electrode to the positive terminal and the upper buffer chamber electrode to the negative terminal of a suitable power supply unit, and carry out the electrophoresis at a constant current of about 40 mA. When the dye-front is about 1 cm from the bottom of the gel (about 40 min), stop the current, and remove the gel from the gel assembly. [NOTE—Do not touch the gel with bare hands. Use gloves.]

Place three to four filter papers, cut to the size of the gel and soaked in the *Transblotting buffer*, on the anode plate of a suitable semidry electroblotter. Cut a nitrocellulose membrane to the same size as the gel plus 1–2 mm on each side, and "wet" the membrane by immersing it into the *Transblotting buffer* for about 15 s, such that there is no air bubble between the buffer and the membrane. Place the "wet" membrane immediately on the stack of filter papers, and remove all air bubbles between the membrane and filter paper by rolling a pipet, or equivalent, gently over the surface of the membrane. Place a few drops of the *Transblotting buffer* on the membrane, and then carefully place the gel on it. Gently roll a pipet, or equivalent, over the surface of the gel to ensure intimate contact between the gel and the membrane, making sure that there are no air bubbles in between. Place a filter paper cut to the size of the gel and soaked in the *Transblotting buffer*, such that there is no air bubble between the filter paper and the gel. Place two to three additional filter papers, prepared in a similar manner, on the top, and complete the transfer stack by placing the cathode plate on the top. Apply a current of about 250 mA, and continue transfer for 90 min.

Remove the membrane, and wash it quickly by immersing into water for 15 s. [NOTE—Do not touch the membrane with bare hands. Use gloves.] Cut the membrane into three strips such that each strip contains a lane containing the *Sample solution*, and mark the strips as PA, LF, and EF at the top. Place each strip in a heat-sealable bag, add 5 mL of *Blocking buffer*, and seal the bag. Incubate for 30 min with constant agitation. Open each bag, and pour out the *Blocking buffer*. Add 9 mL of the diluted *Primary antibody solution* against PA to the bag containing the strip marked PA. Similarly, add 9 mL of the diluted *Primary antibody solution* against LF and EF to the bags containing strips labeled LF and EF, respectively. Seal the bags, and incubate under agitation for 2 h at room temperature or overnight at  $2^\circ$ – $8^\circ$ . Remove the strips from the plastic bags, and place in separate plastic boxes. Add sufficient *Blocking buffer* so that each strip is completely immersed. Agitate for at least 30 min at room temperature with two changes of *Blocking buffer*. Remove the strips, and place each strip in a new heat-sealable plastic bag. Add 9 mL of the *Secondary antibody solution* to each plastic bag. Seal the bags, and incubate for 1 h at room temperature under agitation. Remove the strips from the plastic bags, and place in separate plastic boxes. Add sufficient *Blocking buffer* so that each strip is completely immersed. Agitate for at least 30 min at room temperature with two changes of the *Blocking buffer*. Transfer each strip into a new heat-sealable plastic bag, add 9 mL of *Chromogenic visualization solution* and 10  $\mu\text{L}$  of 30% (v/v) hydrogen peroxide, and seal the bags. Incubate for 30 min under agitation. Transfer the strips into separate plastic boxes, and remove the excess 4-chloro-1-naphthol by incubating with water under agitation for 10 min.

**Acceptance criteria:** Visual observation indicates a strong positive band on the strip labeled PA, a faintly

detectable band on the strip labeled LF, and no detectable band on the strip labeled EF.

## ASSAY

### • RELATIVE POTENCY

[NOTE—Perform analysis on the final product.]

**Standard solutions:** Dilute approved U.S. Reference Standard Anthrax Vaccine 1:1.6, 1:4, 1:10, and 1:25 aseptically with a sterile 0.9% sodium chloride solution.

**Sample solutions:** Dilute Anthrax Vaccine Adsorbed, final product 1:1.6, 1:4, 1:10, and 1:25 aseptically with a sterile 0.9% sodium chloride solution.

#### Analysis

**Samples:** *Standard solutions* and *Sample solutions*

Assign each dilution to a set of 12 randomly selected guinea pigs, strain Mdh:S(RA), 6 males and 6 females, each weighing 315–385 g on the day of vaccination. Inject the animals subcutaneously in the ventral abdomen with 0.5 mL of the assigned dilutions. On the 14th day post-vaccination, challenge the animals with approximately 1000 spores of *Bacillus anthracis* strain Vollum 1B, and record the deaths daily for a 10-day observation period. Record the numbers of surviving animals for each of the *Standard solutions* and the *Sample solutions* at the end of the test. Perform calculations by estimating best-fit lines for the *Standard solutions* and the *Sample solutions* using a logistic regression model that utilizes the number of animals that survived at the end of the test and the time to death for the animals that died. Evaluate statistically the lines corresponding to the *Standard solutions* and the *Sample solutions* for parallelism. Determine the common slope, and draw the parallel lines using the common slope. The relative potency of Anthrax Vaccine Adsorbed with respect to the corresponding U.S. Reference Standard Anthrax Vaccine is the antilog of the horizontal distance between the two parallel lines.

**Acceptance criteria:** The relative potency of Anthrax Vaccine Adsorbed is acceptable if it is between 0.53 and 1.79, both values inclusive.

## OTHER COMPONENTS

### • ALUMINUM (206)

[NOTE—Perform analysis on the final product.]

**Standard solutions:** Prepare as directed for *Standard Preparations* in the chapter, except to prepare solutions containing 10, 20, 30, 40, and 50 µg/mL of aluminum.

**Sample solution:** Mix Anthrax Vaccine Adsorbed, final product well, and transfer 0.2 mL to a 10-mL volumetric flask. Add 0.5 mL of concentrated sulfuric acid and 0.5 mL of concentrated nitric acid, and mix gently. Incubate at room temperature for 30 min or until the solution becomes essentially clear. Dilute with water to volume.

**Analysis:** Proceed as directed for *Procedure* in the chapter. Plot the absorbances versus the content of aluminum, in µg/mL, for the *Standard solutions*, and draw a best-fit straight line through the points using a linear regression model. Calculate the amount of aluminum in Anthrax Vaccine Adsorbed, in mg/mL.

**Acceptance criteria:** The aluminum concentration is between 0.8 and 1.5 mg/mL.

### • FORMALDEHYDE

[NOTE—Perform analysis on the final product.]

**Potassium ferricyanide solution:** Dissolve 2.5 g of potassium ferricyanide in about 100 mL of water, and mix.

**Phenylhydrazine hydrochloride solution:** Dissolve 4 g of phenylhydrazine hydrochloride in 100 mL of absolute alcohol, add 2 mL of water and mix.

**Standard stock solution:** Into a 100-mL volumetric flask containing 2.5 mL of water and 1 mL of sodium hydroxide TS 2, add 1.0 g of the formaldehyde solution to be examined, shake, and dilute with water to 100.0 mL. Determine the concentration of formaldehyde in percent (w/v) as follows. To 10.0 mL of the

solution add 30.0 mL of 0.1 N iodine VS. Mix, and add 10 mL of sodium hydroxide TS 2. After 15 min, add 25 mL of diluted sulfuric acid and 4 mL of starch TS. Titrate with 0.1 N sodium thiosulphate VS. Each 1 mL of 0.05 M iodine is equivalent to 1.501 mg of formaldehyde (CH<sub>2</sub>O).

**Standard solutions:** Dilute the *Standard stock solution* in water to obtain solutions having concentrations of 0.005%, 0.01%, and 0.02% (w/v).

**Sample solution:** Use Anthrax Vaccine Adsorbed, final product as is.

**Analysis:** To suitable glass centrifuge tubes transfer 1.0 mL each of water, the *Standard solutions*, and the *Sample solution*. To each tube, add 1.0 mL of *Potassium ferricyanide solution*, 4.0 mL of 18% (w/v) hydrochloric acid and 2.0 mL of *Phenylhydrazine hydrochloride solution*. Mix after each addition. Incubate for 50–60 min at room temperature. Centrifuge the solutions at 10,000 × g for at least 10 min, and measure absorbances of the supernatants at 540 nm using a suitable spectrophotometer (see *Ultraviolet-Visible Spectroscopy* (857)). Plot the absorbances versus concentrations of formaldehyde, in mg/mL, in the *Standard solutions*, and draw the best-fit straight line through the points.

Calculate the percentage (w/v) of formaldehyde in the sample.

**Acceptance criteria:** The concentration of formaldehyde in Anthrax Vaccine Adsorbed is less than 0.02% (w/v).

### • BENZETHONIUM CHLORIDE

[NOTE—Perform analysis on the final product.]

**Citrate buffer:** 25 g of citric acid monohydrate in about 60 mL of water, and adjust with a solution of sodium hydroxide to a pH of 4.5. Transfer the solution to a 100-mL volumetric flask. Dilute with water to volume and mix.

**Dye solution:** 50 mg of 2',4',5',7'-tetrabromofluorescein in about 100 mL of water, and mix. Dilute 1 mL of this solution with water to 100 mL.

**Docusate sodium solution:** 50 µg/mL of docusate sodium

**Standard solution A:** 0.5 g of benzethonium chloride in a 100-mL volumetric flask, dissolve in 60 mL of water, dilute with water to volume, and mix.

**Standard solutions B, C, D, and E:** Dilute *Standard solution A* with water to obtain solutions having concentrations of 0.001%, 0.002%, 0.003%, and 0.004% (w/v), respectively.

**Sample solution:** Use Anthrax Vaccine Adsorbed, final product as is.

#### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** *Docusate sodium solution*

**Endpoint detection:** Visual

**Analysis:** Transfer 4.0 mL each of *Standard solutions B, C, D, and E* and the *Sample solution* to suitable glass centrifuge tubes. Add 1.0 mL of *Citrate buffer* and 0.4 mL of the *Dye solution* to each tube. Add 4.0 mL of 1,1,2,2-tetrachloroethane to each tube, and vigorously mix on a vortex mixer for 1 min. Centrifuge at about 1000 × g for at least 15 min to separate the organic layer from the aqueous layer. Transfer 2.0 mL of the organic layer from the tubes to another set of glass tubes. Add 4.0 mL of water and 0.5 mL of *Citrate buffer* to each tube, and mix on a vortex mixer for about 1 min. Titrate the benzethonium chloride-dye complex in each tube with the *Titrant* to the colorimetric endpoint indicated by the disappearance of the pink color of the organic layer. [NOTE—Vigorously mix the solution on a vortex mixer after each addition of the *Docusate sodium solution*.] Plot the volumes of *Docusate sodium solution* required versus the concentrations of benzethonium chloride in *Standard solutions B, C, D, and E*, and draw a best-fit straight line through the points. Determine the

concentration of benzethonium chloride in the *Sample solution* from the volume of *Titrant* required to titrate the *Sample solution*.

**Acceptance criteria:** The concentration of benzethonium chloride in Anthrax Vaccine Adsorbed is between 0.0015% and 0.0030% (w/v).

## SPECIFIC TESTS

### • 83 kDa PROTEIN

[NOTE—Perform tests on the filtrate.]

**Trichloroacetic acid solution, Sample buffer, Running buffer, and Sample solution:** Prepare as directed in Identification test A.

**Staining solution:** Prepare a solution of Coomassie blue G-250 having a concentration of 1.25 g/L in a mixture of methanol, acetic acid, and water (4:1:5, v/v).

**Protein molecular weight standard solution:** Reconstitute a vial of protein molecular weight standard mixture containing proteins of molecular weights at least in the range of 14–200 kDa, according to manufacturer's instruction. Dilute the solution with *Sample buffer* such that the concentration of each protein in the solution is about 0.5 µg/µL.

**Analysis:** In a suitable centrifuge tube transfer (10/c) mL of the *Sample solution*, where *c* is the total protein concentration, in µg/mL, of the solution as determined by the test for *Total Protein*. Add 5.5/c mL of *Trichloroacetic acid solution*, and incubate for at least 10 min. Centrifuge at 9000 × *g* for about 10 min, decant off the supernatant, and hold the tube inverted to drain on a filter paper. Dissolve the pellet in 20 µL of *Sample buffer*, and transfer the solution to a polypropylene microfuge tube with a lid. Transfer 20 µL of *Protein molecular weight standard solution* to another polypropylene microfuge tube with a lid. Close the lids tightly, secure with lid-locks, and heat both solutions at 100° for 5 min. Allow the solutions to cool to room temperature, and centrifuge at 10,000 × *g* for 15 s to collect the liquids. Apply the solutions to two consecutive lanes of a 4%–20% gradient tris-glycine polyacrylamide slab gel [NOTE—Do not apply any solution in the outside lanes.], and electrophorese as directed in *Identification* (see *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* (1056)). When the dye-front is about 1 cm from the bottom of the gel (about 40 min), stop the current, and remove the gel from the gel assembly. Soak the gel in a suitable volume of the *Staining solution* for at least 1 h, such that the gel is completely immersed in the *Staining solution* during staining. [NOTE—Do not touch the gel with bare hands. Use disposable gloves.] Destain the gel with a large volume of water under constant agitation with repeated changes of water until the background of the gel is completely color free. Using the molecular weights of the proteins in *Protein molecular weight standard solution*, identify the band corresponding to the PA (MW about 83 kDa) in the *Sample solution* lane. [NOTE—This band is also the predominant band in the lane of the *Sample solution*.] Scan the gel, and determine the relative amount (by peak area) of the 83 kDa band by densitometry in the lane of the *Sample solution*.

**Acceptance criteria:** The content of 83 kDa band is NLT 35% of the total peak area.

### • TOTAL PROTEIN

[NOTE—Perform tests on the filtrate.]

**Standard solution A:** Prepare a solution of albumin bovine serum (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a known concentration of 2.0 mg/mL.

**Standard solutions B, C, D, and E:** Dilute *Standard solution A* with water to obtain solutions having protein concentrations of 4, 8, 16, and 24 µg/mL, respectively.

**Sample solution:** Use anthrax vaccine filtrate as is.

### Analysis

(See *Biotechnology-Derived Articles—Total Protein Assay* (1057), Method 3.)

To a series of test tubes transfer 800 µL each of *Standard solutions B, C, D, and E* and the *Sample solution*. Also transfer 800 µL of water to be used as the blank. Add 200 µL of Coomassie blue G-250 dye solution (see *Reagents, Indicators, and Solutions—Reagent Specifications*) to each tube, and mix without foaming. Determine absorbances of the solutions at 595 nm using a suitable spectrophotometer (see *Ultraviolet-Visible Spectroscopy* (857)), using the blank to set the instrument to zero.

[NOTE—Do not use quartz (silica) spectrophotometer cells; the dye binds to silica.]

Construct a standard curve by plotting the absorbances versus protein concentrations, in µg/mL, of *Standard solutions B, C, D, and E* and by drawing a best-fit straight line using the linear regression method. From the standard curve, determine the total protein concentration of the *Sample solution* using the absorbance value.

**Acceptance criteria:** The protein concentration is between 5 and 20 µg/mL.

- **SAFETY:** It meets the requirements when tested as directed in *Biological Reactivity Tests, In Vivo* (88), *Safety Tests—Biologicals*.

[NOTE—Perform tests on final product.]

- **STERILITY TESTS (71):** It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Direct Inoculation of the Culture Medium*.

[NOTE—Perform tests on final product.]

- **pH (791):** 7.5–8.5

### • SODIUM CHLORIDE

[NOTE—Perform tests on the final product.]

**Standard solutions A and B:** Prepare two solutions of sodium chloride in water having concentrations of 0.2 mM and 2.0 mM, respectively.

**Sample solution:** Transfer 0.5 mL of Anthrax Vaccine Adsorbed, final product to a 50-mL volumetric flask. Dilute with water to volume.

**Analysis:** Determine the voltage readings of *Standard solutions A and B* and the *Sample solution* using an ion-specific electrode specific for the chloride ion electrically coupled with a standard silver-silver chloride reference electrode. Plot the voltage readings versus concentration of chloride, in mg/mL, for *Standard solutions A and B*, and draw a straight line joining the points.

Calculate the concentration of chloride ion in the *Sample solution* from the voltage reading. Assuming that the chloride ion comes entirely from sodium chloride, calculate the concentrations of sodium chloride in the *Sample solution*.

**Acceptance criteria:** The concentration of sodium chloride in Anthrax Vaccine Adsorbed is between 0.75% and 0.95% (w/v).

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in multiple-dose tight Type I glass containers. Store at a temperature between 2° and 8°. Do not freeze.
- **LABELING:** Label it to state that it is to be well shaken before use and that it is not to be frozen.
- **EXPIRATION DATE:** The expiration date is 18 months from the date of manufacture.

## Anticoagulant Citrate Dextrose Solution

### DEFINITION

Anticoagulant Citrate Dextrose Solution is a sterile solution of Citric Acid, Sodium Citrate, and Dextrose in Water for Injection. It contains no antimicrobial agents, and in each 1000 mL it contains:

	Solution A	Solution B
Total Citrate, expressed as anhydrous citric acid ( $C_6H_8O_7$ )	NLT 20.59 g NMT 22.75 g	NLT 12.37 g NMT 13.67 g
Dextrose ( $C_6H_{12}O_6 \cdot H_2O$ )	NLT 23.28 g NMT 25.73 g	NLT 13.96 g NMT 15.44 g
Sodium (Na)	NLT 4.90 g NMT 5.42 g	NLT 2.94 g NMT 3.25 g

Prepare Anticoagulant Citrate Dextrose Solution as follows.

	Solution A	Solution B
Citric Acid (anhydrous)	7.3 g	4.4 g
Sodium Citrate (dihydrate)	22.0 g	13.2 g
Dextrose (monohydrate)	24.5 g	14.7 g
Water for Injection, a sufficient quantity to make	1000 mL	1000 mL

Dissolve the ingredients, and mix. Filter the solution until clear, place immediately in suitable containers, and sterilize.

If desired, 8 g and 4.8 g of monohydrated citric acid may be used instead of the indicated, respective amounts of anhydrous citric acid; 19.3 g and 11.6 g of anhydrous sodium citrate may be used instead of the indicated, respective amounts of dihydrated sodium citrate; and 22.3 g and 13.4 g of anhydrous dextrose may be used instead of the indicated, respective amounts of monohydrated dextrose.

### IDENTIFICATION

#### A. DEXTROSE

**Analysis:** Add a few drops of solution (1 in 20) to 5 mL of hot alkaline cupric tartrate TS.

**Acceptance criteria:** A copious red precipitate of cuprous oxide is formed.

#### B. IDENTIFICATION TESTS—GENERAL, Citrate (191):

Meets the requirements when concentrated to one-half its volume

#### C. IDENTIFICATION TESTS—GENERAL, Sodium (191):

Meets the requirements when concentrated to one-half its volume

### ASSAY

#### TOTAL CITRATE

Mobile phase, Standard preparation 1, and Chromatographic system: Proceed as directed in Assay for Citric Acid/Citrate and Phosphate (345).

**Sample solution:** Pipet 5 mL of Solution into a suitable volumetric flask, and proceed as directed in Assay for Citric Acid/Citrate and Phosphate (345), Assay Preparation for Citric Acid/Citrate Assay.

#### Analysis

**Samples:** Standard preparation 1 and Sample solution Proceed as directed in Assay for Citric Acid/Citrate and Phosphate (345), Procedure.

Calculate the quantity, in g, of anhydrous citric acid ( $C_6H_8O_7$ ) in the volume of Solution taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times F \times D$$

$r_U$  = peak area of citrate from the Sample solution  
 $r_S$  = peak area of citrate from Standard preparation 1

$C_S$  = concentration of citrate in Standard preparation 1 ( $\mu\text{g/mL}$ )

$M_{r1}$  = molecular weight of anhydrous citric acid, 192.12

$M_{r2}$  = molecular weight of citrate ( $C_6H_5O_7$ ), 189.10

$F$  = conversion factor, 0.000001 g/ $\mu\text{g}$

$D$  = dilution factor

**Acceptance criteria:** Each 1000 mL should contain 20.59–22.75 g in Solution A and 12.37–13.67 g in Solution B of total citrate expressed as anhydrous citric acid.

#### SODIUM

**Solution A:** Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, add water to volume, and mix. This solution contains 15 mEq/1000 mL of lithium.

**Standard solution:** Transfer 8.18 g of sodium chloride, previously dried at 105° for 2 h to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains 140 mEq/1000 mL of sodium. Transfer 50  $\mu\text{L}$  of this solution to a 10-mL volumetric flask, dilute with Solution A to volume, and mix.

**Sample solution:** Transfer 25 mL of Solution to a 50-mL volumetric flask, and dilute with water to volume.

Transfer 50  $\mu\text{L}$  of this solution to a 10-mL volumetric flask, dilute with Solution A to volume, and mix.

#### Analysis

**Samples:** Standard solution and Sample solution

Using a suitable flame photometer, adjusted to read zero with Solution A, concomitantly determine the sodium flame emission readings for the Standard solution and the Sample solution at the wavelength of maximum emission at 589 nm.

Calculate the quantity, in g, of sodium (Na) in 1000 mL of Solution taken:

$$\text{Result} = (r_U/r_S) \times (A_r/M_r) \times W \times F$$

$r_U$  = sodium emission readings from the Sample solution

$r_S$  = sodium emission readings from the Standard solution

$A_r$  = atomic weight of sodium, 22.99

$M_r$  = molecular weight of sodium chloride, 58.44

$W$  = weight of sodium chloride taken to make the Standard solution, 8.18 g

$F$  = conversion factor, 2

**Acceptance criteria:** Each 1000 mL should contain 4.90–5.42 g in Solution A and 2.94–3.25 g in Solution B of sodium.

#### DEXTROSE

**Analysis:** Determine the angular rotation of Solution in a suitable polarimeter tube (see Optical Rotation (781)). Where Solution is labeled to contain anhydrous dextrose, calculate the percentage, in g/100 mL, of anhydrous dextrose ( $C_6H_{12}O_6$ ) in the portion of Solution taken:

$$\text{Result} = (100/F) \times A \times R$$

$F$  = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

$A$  = 100 mm divided by the length of the polarimeter tube (mm)

$R$  = observed rotation (°)

Where Solution is labeled to contain dextrose monohydrate, calculate the percentage, in g/100 mL, of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Solution taken:

$$\text{Result} = (100/F) \times (M_{r1}/M_{r2}) \times A \times R$$

$F$  = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

$M_{r1}$  = molecular weight for dextrose monohydrate, 198.17

- $M_{r2}$  = molecular weight for anhydrous dextrose, 180.16  
 $A$  = 100 mm divided by the length of the polarimeter tube (mm)  
 $R$  = observed rotation (°)  
**Acceptance criteria:** Each 1000 mL should contain 23.28–25.73 g in Solution A and 13.96–15.44 g in Solution B of dextrose monohydrate.

**IMPURITIES**

- **CHLORIDE AND SULFATE, Chloride (221):** A 10-mL portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.0035%).

**SPECIFIC TESTS**

- **PH (791):** 4.5–5.5
- **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products (1)*
- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 5.56 USP Endotoxin Units/mL.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose containers of colorless, transparent Type I or Type II glass or of a suitable plastic material (see *Transfusion and Infusion Assemblies and Similar Medical Devices (161)*).
- **LABELING:** Label to indicate the number of mL of Solution required per 100 mL of whole blood or the number of mL of Solution required per volume of whole blood to be collected.
- **USP REFERENCE STANDARDS (11)**  
 USP Citric Acid RS  
 USP Endotoxin RS

## Anticoagulant Citrate Phosphate Dextrose Solution

**DEFINITION**

Anticoagulant Citrate Phosphate Dextrose Solution is a sterile solution of Citric Acid, Sodium Citrate, Monobasic Sodium Phosphate, and Dextrose in Water for Injection. It contains, in each 1000 mL, NLT 2.11 g and NMT 2.33 g of monobasic sodium phosphate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ); NLT 24.22 g and NMT 26.78 g of dextrose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ ); NLT 19.16 g and NMT 21.18 g of total citrate, expressed as anhydrous citric acid ( $\text{C}_6\text{H}_8\text{O}_7$ ); and NLT 6.21 g and NMT 6.86 g of Sodium (Na). It contains no antimicrobial agents.

Prepare Anticoagulant Citrate Phosphate Dextrose Solution as follows.

Citric Acid (anhydrous)	2.99 g
Sodium Citrate (dihydrate)	26.3 g
Monobasic Sodium Phosphate (monohydrate; $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ )	2.22 g
Dextrose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ )	25.5 g
Water for Injection, a sufficient quantity to make	1000 mL

Dissolve the ingredients, and mix. Filter the solution until clear, place immediately in suitable containers, and sterilize.

If desired, 3.27 g of monohydrated citric acid may be used instead of the indicated amount of anhydrous citric acid; 23.06 g of anhydrous sodium citrate may be used instead of the indicated amount of dihydrated sodium citrate; 1.93 g of anhydrous monobasic sodium phosphate may be used instead of the indicated amount of monohydrated monobasic sodium phosphate; and 23.2 g of anhydrous dextrose may be used instead of the indicated amount of monohydrated dextrose.

**IDENTIFICATION**

- **A. DEXTROSE**  
**Analysis:** Add a few drops of solution (1 in 20) to 5 mL of hot alkaline cupric tartrate TS.  
**Acceptance criteria:** A copious red precipitate of cuprous oxide is formed.
- **B. IDENTIFICATION TESTS—GENERAL, Phosphate (191):** Meets the requirements
- **C. IDENTIFICATION TESTS—GENERAL, Citrate (191):** Meets the requirements when concentrated to one-half its volume
- **D. IDENTIFICATION TESTS—GENERAL, Sodium (191):** Meets the requirements when concentrated to one-half its volume

**ASSAY****• TOTAL CITRATE AND TOTAL PHOSPHATE**

**Mobile phase, Standard preparation 2, and Chromatographic system:** Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*.

**Sample solution for total citrate:** Pipet 10 mL of Solution into a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*, *Assay Preparation for Citric Acid/Citrate Assay*.

**Sample solution for total phosphate:** Pipet 5 mL of Solution into a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*, *Assay Preparation for Phosphate Assay*.

**Analysis:** Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*, *Procedure*.

Calculate the quantity, in g, of anhydrous citric acid ( $\text{C}_6\text{H}_8\text{O}_7$ ) in the volume of Solution taken:

$$\text{Result} = (r_u/r_s) \times C_s \times (M_{r1}/M_{r2}) \times F \times D$$

$r_u$  = peak area of citrate from the *Sample solution for total citrate*

$r_s$  = peak area of citrate from *Standard preparation 2*

$C_s$  = concentration of citrate in *Standard preparation 2* ( $\mu\text{g/mL}$ )

$M_{r1}$  = molecular weight of anhydrous citric acid ( $\text{C}_6\text{H}_8\text{O}_7$ ), 192.12

$M_{r2}$  = molecular weight of citrate ( $\text{C}_6\text{H}_5\text{O}_7$ ), 189.10

$F$  = conversion factor, 0.000001 g/ $\mu\text{g}$

$D$  = dilution factor

**Acceptance criteria:** Each 1000 mL of Solution should contain 19.16 g–21.18 g of total citrate expressed as anhydrous citric acid.

**Analysis:** Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*, *Procedure*.

Calculate the quantity of phosphate, in g, expressed as monobasic sodium phosphate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ), in the volume of Solution taken:

$$\text{Result} = (r_u/r_s) \times C_s \times (M_{r1}/M_{r2}) \times F \times D$$

$r_u$  = peak area of phosphate from the *Sample solution for total phosphate*

$r_s$  = peak area of phosphate from *Standard preparation 2*

$C_s$  = concentration of phosphate in *Standard preparation 2* ( $\mu\text{g/mL}$ )

$M_{r1}$  = molecular weight of monobasic sodium phosphate monohydrate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ), 137.99

$M_{r2}$  = molecular weight of phosphate ( $\text{PO}_4$ ), 94.97

$F$  = conversion factor, 0.000001 g/ $\mu\text{g}$

$D$  = dilution factor

**Acceptance criteria:** Each 1000 mL of Solution should contain 2.11–2.33 g of monobasic sodium phosphate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ).

**• DEXTROSE**

**Sample:** 5.0 mL of Solution

**Analysis:** Tare a clean, medium-porosity filtering crucible containing several carborundum boiling chips or glass beads. Pipet 50 mL of freshly mixed alkaline cupric tartrate TS into a 400-mL beaker. Add the boiling chips or glass beads from the tared crucible, 45 mL of water, and 5.0 mL of Solution to the beaker. Heat the beaker and contents over a burner that has been adjusted to cause boiling of the solution to start in 3.5–4 min. Boil the solution for 2 min, accurately timed, and filter immediately through the tared crucible, taking care to transfer all of the boiling chips or glass beads to the crucible. Wash the precipitate with hot water and 10 mL of alcohol. Dry the crucible and contents at 110° to constant weight. Perform a blank determination, and correct the weight of the precipitate from the sample for any precipitate obtained in the blank.

Each mg of cuprous oxide precipitate of the substance under assay is equivalent to 0.496 mg of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ).

**Acceptance criteria:** Each 1000 mL of Solution should contain 24.22–26.78 g of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ).

**• SODIUM**

**Solution A:** Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, add water to volume, and mix. This solution contains 15 mEq/1000 mL of lithium.

**Standard solution:** Transfer 8.18 g of sodium chloride, previously dried at 105° for 2 h to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains 140 mEq/1000 mL of sodium. Transfer 50  $\mu$ L of this solution to a 10-mL volumetric flask, dilute with Solution A to volume, and mix.

**Sample solution:** Transfer 25 mL of Solution to a 50-mL volumetric flask, and dilute with water to volume. Transfer 50  $\mu$ L of this solution to a 10-mL volumetric flask, dilute with Solution A to volume, and mix.

**Analysis**

**Samples:** Standard solution and Sample solution

Using a suitable flame photometer, adjusted to read zero with Solution A, concomitantly determine the sodium flame emission readings for the Standard solution and the Sample solution at the wavelength of maximum emission at 589 nm.

Calculate the quantity, in g, of sodium (Na) in 1000 mL of Solution taken:

$$\text{Result} = (r_u/r_s) \times (A_r/M_r) \times W \times F$$

- $r_u$  = sodium emission readings from the Sample solution  
 $r_s$  = sodium emission readings from the Standard solution  
 $A_r$  = atomic weight of sodium, 22.99  
 $M_r$  = molecular weight of sodium chloride, 58.44  
 $W$  = weight of sodium chloride taken to make the Standard solution, 8.18 g  
 $F$  = conversion factor, 2

**Acceptance criteria:** Each 1000 mL of Solution should contain 6.21–6.86 g of sodium.

**IMPURITIES**

- CHLORIDE AND SULFATE, Chloride (221):** A 10-mL portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.0035%).

## Anticoagulant Citrate Phosphate Dextrose Adenine Solution

**DEFINITION**

Anticoagulant Citrate Phosphate Dextrose Adenine Solution is a sterile solution of Citric Acid, Sodium Citrate, Monobasic Sodium Phosphate, Dextrose, and Adenine in Water for Injection. It contains, in each 1000 mL, NLT 2.11 g and NMT 2.33 g of monobasic sodium phosphate ( $NaH_2PO_4 \cdot H_2O$ ); NLT 30.30 g and NMT 33.50 g of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ); NLT 19.16 g and NMT 21.18 g of total citrate, expressed as citric acid, anhydrous ( $C_6H_8O_7$ ); NLT 6.21 g and NMT 6.86 g of sodium (Na); and NLT 0.247 g and NMT 0.303 g of adenine ( $C_5H_5N_5$ ). It contains no antimicrobial agents.

Prepare Anticoagulant Citrate Phosphate Dextrose Adenine Solution as follows.

Citric Acid (anhydrous)	2.99 g
Sodium Citrate (dihydrate)	26.3 g
Monobasic Sodium Phosphate (monohydrate; $NaH_2PO_4 \cdot H_2O$ )	2.22 g
Dextrose (monohydrate)	31.9 g
Adenine ( $C_5H_5N_5$ )	0.275 g
Water for Injection, a sufficient quantity to make	1000 mL

Dissolve the ingredients, and mix. Filter the solution until clear, place immediately in suitable containers, and sterilize.

If desired, 3.27 g of monohydrated citric acid may be used instead of the indicated amount of anhydrous citric acid; 23.06 g of anhydrous sodium citrate may be used instead of the indicated amount of dihydrated sodium citrate; 1.93 g of anhydrous monobasic sodium phosphate may be used instead of the indicated amount of monohydrated monobasic sodium phosphate; and 29.0 g of anhydrous dextrose may be used instead of the indicated amount of monohydrated dextrose.

**ASSAY****• TOTAL CITRATE AND TOTAL PHOSPHATE**

**Mobile phase, Standard preparation 2, and Chromatographic system:** Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345).

**Sample solution for total citrate:** Pipet 10 mL of Solution into a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Assay Preparation for Citric Acid/Citrate Assay*.

**Sample solution for total phosphate:** Pipet 5 mL of Solution into a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Assay Preparation for Phosphate Assay*.

**Analysis**

**Samples:** Standard preparation 2 and Sample solution for total citrate

Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Procedure*.

Calculate the quantity, in g, of anhydrous citric acid ( $C_6H_8O_7$ ) in the volume of Solution taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times F \times D$$

- $r_U$  = peak area of citrate from the *Sample solution* for total citrate  
 $r_S$  = peak area of citrate from *Standard preparation 2*  
 $C_S$  = concentration of citrate in *Standard preparation 2* ( $\mu\text{g/mL}$ )  
 $M_{r1}$  = molecular weight of anhydrous citric acid, 192.12  
 $M_{r2}$  = molecular weight of citrate ( $C_6H_5O_7$ ), 189.10  
 $F$  = conversion factor, 0.000001 g/ $\mu\text{g}$   
 $D$  = dilution factor

**Acceptance criteria:** Each 1000 mL of Solution should contain NLT 19.16 g and NMT 21.18 g of total citrate expressed as anhydrous citric acid ( $C_6H_8O_7$ ).

#### Analysis

**Samples:** *Standard preparation 2* and *Sample solution* for total phosphate

Calculate the quantity of phosphate, in g, expressed as monobasic sodium phosphate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ), in the volume of Solution taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times F \times D$$

- $r_U$  = peak area of phosphate from the *Sample solution* for total phosphate  
 $r_S$  = peak area of phosphate from *Standard preparation 2*  
 $C_S$  = concentration of phosphate in *Standard preparation 2* ( $\mu\text{g/mL}$ )  
 $M_{r1}$  = molecular weight of monobasic sodium phosphate monohydrate, 137.99  
 $M_{r2}$  = molecular weight of phosphate ( $\text{PO}_4$ ), 94.97  
 $F$  = conversion factor, 0.000001 g/ $\mu\text{g}$   
 $D$  = dilution factor

**Acceptance criteria:** Each 1000 mL of Solution should contain 2.11–2.33 g of monobasic sodium phosphate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ).

#### • SODIUM

**Solution A:** Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, add water to volume, and mix. This solution contains 15 mEq/1000 mL of lithium.

**Standard solution:** Transfer 8.18 g of sodium chloride, previously dried at  $105^\circ$  for 2 h to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains 140 mEq/1000 mL of sodium. Transfer 50  $\mu\text{L}$  of this solution to a 10-mL volumetric flask, dilute with *Solution A* to volume, and mix.

**Sample solution:** Transfer 25 mL of Solution to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 50  $\mu\text{L}$  of this solution to a 10-mL volumetric flask, dilute with *Solution A* to volume, and mix.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Using a suitable flame photometer, adjusted to read zero with *Solution A*, concomitantly determine the sodium flame emission readings for the *Standard solution* and the *Sample solution* at the wavelength of maximum emission at 589 nm.

Calculate the quantity, in g, of sodium (Na) in 1000 mL of Solution taken:

$$\text{Result} = (r_U/r_S) \times (A_r/M_r) \times W \times F$$

- $r_U$  = sodium emission readings from the *Sample solution*  
 $r_S$  = sodium emission readings from the *Standard solution*  
 $A_r$  = atomic weight of sodium, 22.99

- $M_r$  = molecular weight of sodium chloride, 58.44  
 $W$  = weight of sodium chloride taken to make the *Standard solution*, 8.18 g  
 $F$  = conversion factor, 2

**Acceptance criteria:** Each 1000 mL of Solution should contain 6.21 g–6.86 g of sodium.

#### • DEXTROSE

**Sample:** 5 mL of Solution

**Analysis:** Tare a clean, medium-porosity filtering crucible containing several carborundum boiling chips or glass beads. Pipet 50 mL of freshly mixed alkaline cupric tartrate TS into a 400-mL beaker. Add the boiling chips or glass beads from the tared crucible, 45 mL of water, and 5.0 mL of Solution to the beaker. Heat the beaker and contents over a burner that has been adjusted to cause boiling of the solution to start in 3.5–4 min. Boil the solution for 2 min, accurately timed, and filter immediately through the tared crucible, taking care to transfer all of the boiling chips or glass beads to the crucible. Wash the precipitate with hot water and 10 mL of alcohol. Dry the crucible and contents at  $110^\circ$  to constant weight. Perform a blank determination, and make any necessary correction.

Each mg of cuprous oxide precipitate obtained is equivalent to 0.496 mg of dextrose ( $C_6H_{12}O_6 \cdot \text{H}_2\text{O}$ ).

**Acceptance criteria:** Each 1000 mL of Solution should contain 30.30–33.50 g of dextrose ( $C_6H_{12}O_6 \cdot \text{H}_2\text{O}$ ).

#### • ADENINE

**Mobile phase:** Dissolve 3.45 g of ammonium dihydrogen phosphate in 950 mL of water, add 10 mL of glacial acetic acid, dilute with water to 1000 mL, and mix. Pass the solution through a membrane filter with a 1- $\mu\text{m}$  or finer pore size, and degas.

**System suitability solution:** 0.275 mg/mL of each USP Adenine RS and purine in dilute hydrochloric acid (1 in 120)

**Standard solutions:** Place quantities of USP Adenine RS in dilute hydrochloric acid (1 in 120) in three separate volumetric flasks, and dilute with the dilute hydrochloric acid solution to volume to obtain *Standard solutions* having known concentrations of 0.25, 0.275, and 0.30 mg of adenine per mL, respectively. Protect from light.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm  $\times$  30-cm stainless steel; packing L9

**Flow rate:** 2.0 mL/min

**Injection volume:** 20  $\mu\text{L}$

#### System suitability

**Sample:** *System suitability solution* (NLT four injections)

#### Suitability requirements

**Resolution:** NLT 3.0 between adenine and purine

**Relative standard deviation:** NMT 2.5% for adenine peak and NMT 2.0% for the retention time of adenine peak

#### Analysis

**Samples:** *Standard solutions* and *Solution*  
 Plot the responses against the concentrations, in mg, of USP Adenine RS per mL of the *Standard solutions*. Calculate the quantity, in mg, of adenine ( $C_5H_5N_5$ ) in each mL of the Solution taken as the value read directly from the Standard curve corresponding to the response obtained from the portion of the Solution chromatographed.

**Acceptance criteria:** Each 1000 mL of Solution should contain 0.247–0.303 g of adenine ( $C_5H_5N_5$ ).

#### IMPURITIES

- **CHLORIDE AND SULFATE, Chloride (221):** A 10-mL portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.0035%).

**SPECIFIC TESTS**

- **PH (791):** 5.0–6.0
- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 5.56 USP Endotoxin Units/mL.
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, of colorless, transparent, Type I or Type II glass, or of a suitable plastic material (see *Transfusion and Infusion Assemblies and Similar Medical Devices* (161)).
- **LABELING:** Label to indicate the number of mL of solution required per 100 mL of whole blood or the number of mL of solution required per volume of whole blood to be collected.
- **USP REFERENCE STANDARDS (11)**  
USP Adenine RS  
USP Citric Acid RS  
USP Endotoxin RS

**Anticoagulant Sodium Citrate Solution****DEFINITION**

Anticoagulant Sodium Citrate Solution is a sterile solution of Sodium Citrate in Water for Injection. It contains, in each 100 mL, NLT 3.80 g and NMT 4.20 g of sodium citrate dihydrate ( $C_6H_5Na_3O_7 \cdot 2H_2O$ ). It contains no antimicrobial agents.

Prepare Anticoagulant Sodium Citrate Solution as follows.

Sodium Citrate (dihydrate)	40 g
Water for Injection, a sufficient quantity to make	1000 mL

[NOTE—Anhydrous sodium citrate (35.1 g) may be used instead of the dihydrate.]

Dissolve the *Sodium Citrate* in sufficient *Water for Injection* to make 1000 mL, and filter until clear. Place the solution in suitable containers, and sterilize.

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL, Citrate (191):** Meets the requirements when evaporated to a concentration of 1 in 20
- **B. IDENTIFICATION TESTS—GENERAL, Sodium (191):** Meets the requirements when evaporated to a concentration of 1 in 20

**ASSAY****PROCEDURE**

**Mobile phase, Standard preparation 1, and Chromatographic system:** Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345).

**Sample solution:** Pipet 10 mL of Solution into a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Assay Preparation for Citric Acid/Citrate Assay*.

**Analysis**

**Samples:** *Standard preparation 1* and *Sample solution*  
Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Procedure*.

Calculate the quantity, in g, of sodium citrate dihydrate ( $C_6H_5Na_3O_7 \cdot 2H_2O$ ) in the volume of Solution taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times D \times F$$

- $r_U$  = peak area of citrate from the *Sample solution*  
 $r_S$  = peak area of citrate from *Standard preparation 1*  
 $C_S$  = concentration of citrate in *Standard preparation 1* ( $\mu\text{g/mL}$ )

$M_{r1}$  = molecular weight of sodium citrate dihydrate, 294.10

$M_{r2}$  = molecular weight of citrate ( $C_6H_5O_7$ ), 189.10

$D$  = dilution factor

$F$  = conversion factor, 0.000001 g/ $\mu\text{g}$

**Acceptance criteria:** In each 100 mL, 3.80–4.20 g of sodium citrate dihydrate ( $C_6H_5Na_3O_7 \cdot 2H_2O$ )

**SPECIFIC TESTS**

- **PH (791):** 6.4–7.5
- **BACTERIAL ENDOTOXINS TEST (85):** Contains NMT 5.56 USP Endotoxin Units/mL
- **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products* (1)

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I or Type II glass.
- **USP REFERENCE STANDARDS (11)**  
USP Citric Acid RS  
USP Endotoxin RS

**Antimony Potassium Tartrate**

$C_8H_4K_2O_{12}Sb_2 \cdot 3H_2O$  667.87

$C_8H_4K_2O_{12}Sb_2$  613.82

Antimonate(2-), bis[ $\mu$ -[2,3-dihydroxybutanedioato(4-)- $O^1, O^2: O^3, O^4$ ]-di-, dipotassium, trihydrate, stereoisomer; Dipotassium bis[ $\mu$ -L-(+)-tartrato(4-)]diantimonate(2-) trihydrate [28300-74-5].  
Anhydrous [11071-15-1].

**DEFINITION**

Antimony Potassium Tartrate contains NLT 99.0% and NMT 103.0% of antimony potassium tartrate ( $C_8H_4K_2O_{12}Sb_2 \cdot 3H_2O$ ).

**IDENTIFICATION****A.**

**Sample:** An appropriate quantity

**Analysis:** Heat the *Sample* to redness.

**Acceptance criteria:** It chars, emits an odor resembling that of burning sugar, and leaves a blackened residue. This residue has an alkaline reaction, and when a small fragment of it is held in a nonluminous flame, the flame is tinted violet.

**B.**

**Sample solution:** Antimony Potassium Tartrate (1 in 20) in water acidified with hydrochloric acid

**Analysis:** Add hydrogen sulfide TS to the *Sample solution*.

**Acceptance criteria:** It yields an orange-red precipitate, which is soluble in ammonium sulfide TS and in 1 N sodium hydroxide.

- **C. IDENTIFICATION TESTS—GENERAL, Tartrate (191):** Meets the requirements

**ASSAY****PROCEDURE**

**Sample:** 500 mg

**Analysis:** Dissolve the *Sample* in 50 mL of water, add 5 g of potassium sodium tartrate, 2 g of sodium borate, and 3 mL of starch TS, and immediately titrate with 0.1 N iodine VS to the production of a persistent blue

color. Each mL of 0.1 N iodine is equivalent to 16.70 mg of antimony potassium tartrate ( $C_8H_4K_2O_{12}Sb_2 \cdot 3H_2O$ ).

Acceptance criteria: 99.0%–103.0%

### IMPURITIES

#### • ARSENIC

**Sample solution:** Dissolve 100 mg in 5 mL of hydrochloric acid. Add 10 mL of a recently prepared solution of 20 g of stannous chloride in 30 mL of hydrochloric acid.

**Blank:** Add 5 mL of hydrochloric acid to 10 mL of a recently prepared solution of 20 g of stannous chloride in 30 mL of hydrochloric acid.

**Analysis:** Transfer the *Sample solution* to a color-comparison tube, and allow to stand for 30 min.

**Acceptance criteria:** NMT 0.015%; viewed downward over a white surface, the color of the solution appears no deeper than that of the *Blank* to which has been added 15 µg of arsenic.

#### • LEAD (251): NMT 20 ppm

### SPECIFIC TESTS

#### • COMPLETENESS OF SOLUTION (641)

**Sample:** 750 mg

**Solvent:** Water

**Acceptance criteria:** Meets the requirements

#### • LOSS ON DRYING (731)

**Analysis:** Dry at 105° to constant weight.

**Acceptance criteria:** NMT 2.7%

#### • ACIDITY OR ALKALINITY

**Sample solution:** Dissolve 1.0 g in 50 mL of carbon dioxide-free water.

**Analysis:** Titrate the *Sample solution* with 0.010 N hydrochloric acid or 0.010 N sodium hydroxide to a pH of 4.5.

**Acceptance criteria:** NMT 2.0 mL

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

## Antimony Sodium Tartrate

$C_8H_4Na_2O_{12}Sb_2$

581.61

Antimonate(2-), bis[μ-[2,3-dihydroxybutanedioato(4-)-O<sup>1</sup>,O<sup>2</sup>:O<sup>3</sup>,O<sup>4</sup>]]di-, disodium, stereoisomer;

Disodium bis[μ-[L-(+)-tartrato(4-)]diantimonate(2-)] [34521-09-0].

### DEFINITION

Antimony Sodium Tartrate contains NLT 98.0% and NMT 101.0% of antimony sodium tartrate ( $C_8H_4Na_2O_{12}Sb_2$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL,** *Antimony* (191), *Sodium* (191), and *Tartrate* (191)

### ASSAY

#### • PROCEDURE

**Sample:** 500 mg

**Analysis:** Dissolve the *Sample* in 50 mL of water, add 5 g of potassium sodium tartrate, 2 g of sodium borate,

and 3 mL of starch TS, and immediately titrate with 0.1 N iodine VS to the production of a persistent blue color. Each mL of 0.1 N iodine is equivalent to 14.54 mg of antimony sodium tartrate ( $C_8H_4Na_2O_{12}Sb_2$ ).  
Acceptance criteria: 98.0%–101.0% on the dried basis

### IMPURITIES

- **ARSENIC, Method II (211):** NMT 8 ppm

- **LEAD (251):** NMT 20 ppm

### SPECIFIC TESTS

#### • LOSS ON DRYING (731)

**Analysis:** Dry at 105° to constant weight.

**Acceptance criteria:** NMT 6.0%

#### • ACIDITY OR ALKALINITY

**Sample solution:** Dissolve 1.0 g in 50 mL of carbon dioxide-free water.

**Analysis:** Titrate the *Sample solution* with 0.010 N hydrochloric acid or 0.010 N sodium hydroxide to a pH of 4.5.

**Acceptance criteria:** NMT 2.0 mL

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

## Antipyrine

$C_{11}H_{12}N_2O$

188.23

1,2-Dihydro-1,5-dimethyl-2-phenyl-3H-pyrazol-3-one;  
2,3-Dimethyl-1-phenyl-3-pyrazolin-5-one [60-80-0].

### DEFINITION

Antipyrine contains NLT 98.0% and NMT 102.0% of antipyrine ( $C_{11}H_{12}N_2O$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** 0.77 g/L of ammonium acetate in water. Adjust with diluted ammonium hydroxide to a pH of 7.0 and pass through a filter of 0.2-µm pore size.

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
1.0	75	25
5.0	20	80
5.01	75	25
8.0	75	25

**System suitability solution:** 0.12 mg/mL of USP Antipyrine RS and 0.12 µg/mL of USP Antipyrine Related Compound A RS in water

**Standard solution:** 0.12 mg/mL of USP Antipyrine RS in water

**Sample solution:** 0.12 mg/mL of Antipyrine in water

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 2.1-mm × 10-cm; 1.8-μm packing L1

**Column temperature:** 35°

**Flow rate:** 0.4 mL/min

**Injection volume:** 1 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between antipyrine and antipyrine related compound A, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 0.73%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of antipyrine (C<sub>11</sub>H<sub>12</sub>N<sub>2</sub>O) in the portion of Antipyrine taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Antipyrine RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Antipyrine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** <281>: NMT 0.15%

**Delete the following:**

- **HEAVY METALS** <231>

**Test preparation:** Dissolve 1 g in 2 mL of 1 N acetic acid, and add water to make 25 mL.

**Acceptance criteria:** NMT 20 ppm (Official 1-Jan-2018)

- **ORGANIC IMPURITIES**

**Buffer:** Dissolve 6.8 g of monobasic potassium phosphate in 1 L of water, add 2 mL of triethylamine, and adjust with 5 N sodium hydroxide solution to a pH of 7.0.

**Mobile phase:** Methanol and *Buffer* (43:100)

**System suitability solution:** 5 μg/mL each of USP Antipyrine RS and USP Antipyrine Related Compound A RS in *Mobile phase*

**Standard solution:** 0.5 μg/mL of USP Antipyrine RS and 0.25 μg/mL of USP Antipyrine Related Compound A RS in *Mobile phase*

**Sample solution:** 500 μg/mL of Antipyrine in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 6.0-mm × 15-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10 μL

**Run time:** 3 times the retention time of antipyrine

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 3.0 between antipyrine related compound A and antipyrine

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of antipyrine related compound A in the portion of Antipyrine taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response of antipyrine related compound A from the *Sample solution*

$r_s$  = peak response of antipyrine related compound A from the *Standard solution*

$C_s$  = concentration of USP Antipyrine Related Compound A RS in the *Standard solution* (μg/mL)

$C_u$  = concentration of the *Sample solution* (μg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Antipyrine taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response of any individual unspecified impurity from the *Sample solution*

$r_s$  = peak response of antipyrine from the *Standard solution*

$C_s$  = concentration of USP Antipyrine RS in the *Standard solution* (μg/mL)

$C_u$  = concentration of the *Sample solution* (μg/mL)

**Acceptance criteria:** See *Table 2*. Disregard any impurity peak less than 0.03%.

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Antipyrine related compound A	0.8	0.05
Antipyrine	1.0	—
Individual unspecified impurity	—	0.05
Total impurities	—	0.1

**SPECIFIC TESTS**

- **LOSS ON DRYING** <731>

**Analysis:** Dry at 60° for 2 h.

**Acceptance criteria:** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** <11>

USP Antipyrine RS

USP Antipyrine Related Compound A RS

3-Methyl-1-phenyl-1H-pyrazol-5(4H)-one.

C<sub>10</sub>H<sub>10</sub>N<sub>2</sub>O 174.20

## Antipyrine and Benzocaine Otic Solution

» Antipyrine and Benzocaine Otic Solution is a solution of Antipyrine and Benzocaine in Glycerin. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of antipyrine (C<sub>11</sub>H<sub>12</sub>N<sub>2</sub>O) and benzocaine (C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>). [NOTE—In the preparation of this Otic Solution, use Glycerin that has a low water content, in order that the Otic Solution may comply with the *Water* limit. This may be ensured by using Glycerin having a specific gravity of not less than 1.2607, corresponding to a concentration of 99.5 percent.]

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Antipyrine RS

USP Benzocaine RS

**Identification—**

A: Transfer 5 mL to a separator containing 25 mL of water, and extract the solution with two 25-mL portions of a mixture of equal volumes of ether and solvent hexane. Combine the extracts, and retain the water solution for *Identification* test B. Extract the ether-hexane solution with 50 mL of water, and discard the water layer. Evaporate the ether-hexane solution to dryness, dry the residue in vacuum at 40° to 50° for 1 hour, and dissolve the residue in 1 mL of chloroform: the IR absorption spectrum of this solution exhibits maxima at the same wavelengths as that of a similar solution of USP Benzocaine RS, concomitantly measured.

B: Add 5 mL of 1 N sodium hydroxide solution to the water solution retained from *Identification* test A, and extract with two 25-mL portions of chloroform. Evaporate the combined extracts to dryness, dry the residue in vacuum at 40° to 50° for 1 hour, and dissolve the residue in 3 mL of chloroform: the IR absorption spectrum of this solution exhibits maxima at the same wavelengths as that of a similar solution of USP Antipyrine RS, concomitantly measured.

C: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water Determination, Method I** (921): not more than 1.0% is found.

**Assay—**

*Ammonium acetate solution*—Dissolve 7.7 g of ammonium acetate in water, dilute with water to 1000 mL, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of *Ammonium acetate solution* and acetonitrile (3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer about 15 mg of USP Benzocaine RS, accurately weighed, to a 100-mL volumetric flask, add 15/ *J* mg of USP Antipyrine RS, accurately weighed, *J* being the ratio of the labeled amount, in mg, of antipyrine to the labeled amount, in mg, of benzocaine per mL of Otic Solution. Add 50 mL of methanol, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Otic Solution, equivalent to about 15 mg of benzocaine, to a 100-mL volumetric flask. Dissolve in 50 mL of methanol, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 15-cm column that contains 5-μm packing L15. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the benzocaine peak is not more than 2.5, the column efficiency for the benzocaine peaks is not less than 1500 theoretical plates, and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.35 for antipyrine, and 1.0 for benzocaine. Calculate the quantity, in mg, of benzocaine (C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>) in each mL of the Otic Solution taken by the formula:

$$1000(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Benzocaine RS in the *Standard preparation*; *V* is the volume, in mL, of Otic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses due to benzocaine in the *Assay preparation* and the

*Standard preparation*, respectively. Calculate the quantity, in mg, of antipyrine (C<sub>11</sub>H<sub>12</sub>N<sub>2</sub>O) in each mL of the Otic Solution taken by the same formula, changing the terms to refer to antipyrine instead of benzocaine.

## Antipyrine, Benzocaine, and Phenylephrine Hydrochloride Otic Solution

» Antipyrine, Benzocaine, and Phenylephrine Hydrochloride Otic Solution is a solution of Antipyrine, Benzocaine, and Phenylephrine Hydrochloride in a suitable nonaqueous solvent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of antipyrine (C<sub>11</sub>H<sub>12</sub>N<sub>2</sub>O), benzocaine (C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>), and phenylephrine hydrochloride (C<sub>9</sub>H<sub>13</sub>NO<sub>2</sub> · HCl).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Antipyrine RS

USP Benzocaine RS

USP Phenylephrine Hydrochloride RS

**Identification**—The retention times of the major peaks in the chromatograms of the *Assay preparations* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Assay—**

*Mobile phase*—Mix 480 mL of acetonitrile, 3520 mL of a 0.005 M solution of sodium 1-heptanesulfonate in water, and 4 mL of phosphoric acid.

*Standard preparation*—Accurately weigh about 25 mg of USP Antipyrine RS, about 25 mg of USP Benzocaine RS, and about 25 mg of USP Phenylephrine Hydrochloride RS into a 250-mL volumetric flask. Add 5 mL of a 0.5 mg per mL solution of *p*-aminobenzoic acid in *Mobile phase*. Add 150 mL of *Mobile phase*, and mix to effect solution, sonicating if necessary. Dilute with *Mobile phase* to volume, and mix.

*Assay preparation A*—Transfer an accurately measured volume of Otic Solution, equivalent to about 100 mg of antipyrine, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation B*—Transfer an accurately measured volume of Otic Solution, equivalent to about 100 mg of benzocaine, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation P*—Transfer an accurately measured volume of Otic Solution, equivalent to about 5 mg of phenylephrine hydrochloride, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm × 30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.19 for *p*-aminobenzoic acid, 0.26 for phenylephrine, 0.64 for antipyrine, and 1.0 for benzocaine; the resolution, *R*, between phenylephrine and aminobenzoic acid is not less than 1.5, and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20 or 25  $\mu$ L) of the *Standard preparation* and each of the *Assay preparations* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of antipyrine ( $C_{11}H_{12}N_2O$ ) in each mL of the Otic Solution taken by the formula:

$$(C/V)(r_U/r_S)$$

in which *C* is the concentration, in  $\mu$ g per mL of USP Antipyrine RS in the *Standard preparation*; *V* is the volume, in mL, of Otic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the antipyrine peak responses obtained from *Assay preparation A* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of benzocaine ( $C_9H_{11}NO_2$ ) in each mL of the Otic Solution taken by the formula:

$$(C/V)(r_U/r_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Benzocaine RS in the *Standard preparation*; *V* is the volume, in mL, of Otic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the benzocaine peak responses obtained from *Assay preparation B* and the *Standard preparation*, respectively. Calculate the quantity, in  $\mu$ g of phenylephrine hydrochloride ( $C_9H_{13}NO_2 \cdot HCl$ ) in each mL of the Otic Solution taken by the formula:

$$50(C/V)(r_U/r_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Phenylephrine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of Otic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the phenylephrine peak responses obtained from *Assay preparation P* and the *Standard preparation*, respectively.

## Antithrombin III Human

[9000-94-6].

### DEFINITION

Antithrombin III Human is a glycoprotein, which is the major inhibitor of thrombin and other activated clotting factors, including factors IX, X, XI, and XII. It is obtained from human plasma of healthy donors who have been tested and shown to be free from detectable agents of infection transmissible by transfusion of blood or blood derivatives. The manufacturing steps are shown to remove or inactivate known agents of infection. If substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to an acceptable level and that any residues are such as not to compromise the safety of the preparation for patients. When reconstituted in the recommended volume of diluent, the potency is NLT 25 International Units (IU)/mL. It contains 80%–120% of the potency stated on the label.

### IDENTIFICATION

- **A.** Meets the requirements of the *Assay*

### ASSAY

#### PROCEDURE

**Solution A:** Dissolve tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water to obtain a solution having concentrations of 0.050, 0.0075, and 0.175 M, respectively. Adjust with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

**Solution B:** 0.05% (w/v) of albumin human in *Solution A*

**Solution C:** 10 mg/mL of polybrene in *Solution B*

**Solution D:** Reconstitute thrombin bovine (factor IIa), and dilute with *Solution B* to obtain a solution having a concentration of 4 Thrombin IU/mL.

**Solution E:** Prepare a solution of chromogenic substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) for thrombin (factor IIa) in *Solution C* to obtain a solution having a concentration of about 40.0 mM.

**Solution F:** Resuspend USP Heparin Sodium for Assays RS according to the USP Certificate and dilute to 3 USP Heparin Units/mL in *Solution A*.

**Standard solutions:** Prepare seven dilutions from USP Antithrombin III Human RS within the linear range of the assay in *Solution F* (for example, 1.7, 1.5, 1.2, 1.0, 0.8, 0.6, and 0.4 IU/mL).

**Sample solutions:** Prepare three or more dilutions in *Solution F* within the linear range of the assay.

**Blank:** *Solution A*

**Analysis:** [NOTE—The procedure also can be performed using alternative platforms.]

For each dilution of the *Standard solution* and *Sample solution*, at least duplicates should be tested. Label a suitable number of tubes depending on the number of replicates that will be tested. For example, if five blanks will be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, and T3 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, S4, S5, S6, and S7 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, S5, S6, S7, B2, T1, T2, T3, B3, T1, T2, T3, B4, S1, S2, S3, S4, S5, S6, S7, B5.]

Prewarm *Solution D* and *Solution E* at 37°. Pipet 50  $\mu$ L each of the *Standard solutions*, *Sample solutions*, and *Blank* into suitable tubes placed in a water bath set at 37°. Add 350  $\mu$ L of prewarmed *Solution D* to each tube, mix, and incubate for 1 min. Add 100  $\mu$ L of prewarmed *Solution E* to each tube in the same order and mix. Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Ultraviolet-Visible Spectroscopy* (857)). Calculate the change in absorbance/min. Plot standard concentrations against resulting absorbance values and determine potency by interpolating from the standard curve using mean sample absorbances.

#### System suitability

**Samples:** *Standard solutions* and *Sample solutions*

The *R<sup>2</sup>* value of the standard curve is NLT 0.99. The initial and final blanks differ by NMT 10%. The absorbances of the three dilutions of the *Sample solution* must fall within the range of absorbances of the standard curve. The three dilutions of the *Sample solution* give potency estimates that differ by NMT 10%.

**Acceptance criteria:** 80%–120% of the potency stated on the label.

### IMPURITIES

#### HEPARIN CONTENT

**Solution A:** 9 g/L of sodium chloride

**Sheep plasma substrate:** Use sheep plasma suitable for the test procedure. If frozen, thaw at 37°.

**APTT reagent:** Use a suitable activated partial thromboplastin time (APTT) reagent containing phospholipid and a contact activator at a dilution giving a suitable blank recalcification time not exceeding 60 s.

**Calcium chloride solution:** 3.7 g/L of calcium chloride

**System suitability solution:** 5 IU/mL of heparin sodium for assays in USP Antithrombin III Human RS

**Standard solutions:** Make three or more dilutions of USP Heparin Sodium for Assays RS to known concentrations in USP Heparin Units/mL that are in the expected

range of the sample (for example, 0.5–1.5 USP Heparin Units/mL).

**Sample solutions:** Make three or more dilutions of Antithrombin III Human in the range of the *Standard solution* dilutions.

**Blank:** *Solution A*

**Analysis:** [NOTE—The procedure also can be performed using alternative platforms.]

For each *System suitability solution*, *Standard solution*, and *Sample solution*, at least duplicates should be tested. Label a suitable number of tubes depending on the number of replicates that will be tested. For example, if five blanks will be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, and T3 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, and S3 each at least in duplicate for the dilutions of the *Standard solutions* and SS for the *System suitability solution*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, B2, SS, T1, T2, T3, B3, T1, T2, T3, SS, B4, S1, S2, S3, B5.] In the following order add 1.0 mL of thawed *Sheep plasma substrate* to 1.0 mL of the *Standard solution* dilutions or the *Sample solution* dilutions or the *System suitability solution*. After each addition, mix but do not allow bubbles to form. Transfer each tube to a water bath at 37°, allow to equilibrate at 37° for about 15 min, and add to each tube 1 mL of *APTT reagent* previously heated to 37°. After an appropriate time for the *APTT reagent* used, usually 2–5 min, add 1 mL of *Calcium chloride solution* previously heated to 37° and determine the clotting time. Plot standard concentrations against resulting clotting times and determine heparin content by interpolating from the standard curve using mean sample clotting times. For samples with clotting times longer than the lowest standard dilution, report the result as NMT the lowest *Standard solution* concentration.

#### System suitability

**Samples:** *Standard solutions* and *Sample solutions*  
The  $R^2$  value of the standard curve is NLT 0.99. The three dilutions of the *Sample solution* give heparin content estimates that differ by NMT 10%. The heparin content in the *System suitability solution* is in the range of 4.0–7.5 IU/mL.

**Acceptance criteria:** NMT 0.1 USP Heparin Unit/Antithrombin III IU

#### SPECIFIC TESTS

- **STERILITY TESTS** (71), *Test for Sterility of the Product to Be Examined, Direct Inoculation of the Culture Medium*: Meets the requirements
- **WATER DETERMINATION** (921), *Method I*: NMT 3.0%
- **PYROGEN TEST** (151): Inject 50 USP Antithrombin III Units per kg of the rabbit's weight, calculated from the activity stated on the label: meets the requirements.
- **GENERAL SAFETY**: Meets the requirements for biologics in *Biological Reactivity Tests, In Vivo* (88), *Safety Tests—Biologicals*
- **OSMOLALITY AND OSMOLARITY** (785), *Osmolality*: Reconstitute with the diluent according to the manufacturer's instruction: NLT 240 mOsmol/kg for the solution.
- **pH** (791): Reconstitute with the diluent according to the manufacturer's instruction: 6.0–7.5.
- **MOLECULAR WEIGHT DISTRIBUTION**

**Mobile phase:** 0.05 M sodium phosphate (dibasic), 0.05 M sodium phosphate (monobasic), 0.4 M arginine monohydrochloride, and 0.05% sodium azide. Adjust with 1 N sodium hydroxide to a pH of 6. Degas and filter.

**Solution A:** 4–5 mg/mL of thyroglobulin in *Mobile phase*

**Sample solution:** 8–10 mg/mL of Antithrombin III Human

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Columns**

**Guard:** 7.5 mm × 7.5 cm guard column containing packing L59

**Analytical:** 7.5 mm × 30 cm analytical column containing packing L59

#### Temperatures

**Autosampler:** 7°

**Column:** Ambient

**Flow rate:** 0.5 mL/min maintained constant to ±1%

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Sample solution*

#### Suitability requirements

**Column efficiency:** NLT 2000 theoretical plates

**Tailing factor:** 0.9–1.3

#### Analysis

**Samples:** *Solution A* and *Sample solution*

**Acceptance criteria:** Note the retention times of the major peak in the *Solution A* chromatogram. The relative peak area of the high-molecular weight peak eluting at about the same retention time as the major peak in the *Solution A* chromatogram, or earlier, is NMT 13%.

#### • TOTAL PROTEIN CONTENT

**Solution A:** 1000 mg/mL of trichloroacetic acid in water

**Sample solution:** 7.5 mg/mL of Antithrombin III Human in 0.15 M sodium chloride solution

**Blank:** 0.15 M solution of sodium chloride

**Analysis:** To each of 2.0 mL of the *Sample solution* and the *Blank* in suitable centrifuge tubes, add 1.5 mL of *Solution A*. Mix, allow to stand for at least 10 min, centrifuge for 5 min, and decant the supernatant. Resuspend the precipitates in 1.5 mL of *Solution A*, centrifuge for 5 min, decant the supernatant, and hold the tubes inverted on a filter paper to drain. Quantitatively transfer the residues with a minimum quantity of water to a micro-Kjeldahl flask, and determine the nitrogen content (see *Nitrogen Determination* (461), *Method II*). Multiply the result, corrected for the *Blank*, by 6.25 to calculate the quantity of protein.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Use a Type I glass container with an appropriate stopper and seal. Store protected from light between 2° and 8°, excursions permitted up to 25°.
- **LABELING:** The labeling should state the content of antithrombin III in USP Antithrombin III Units. The diluent and the volume to be used to reconstitute the preparation are indicated.
- **USP REFERENCE STANDARDS** (11)  
USP Antithrombin III Human RS  
USP Heparin Sodium for Assays RS

### Apomorphine Hydrochloride

$\text{C}_{17}\text{H}_{17}\text{NO}_2 \cdot \text{HCl} \cdot \frac{1}{2}\text{H}_2\text{O}$

312.79

$\text{C}_{17}\text{H}_{17}\text{NO}_2 \cdot \text{HCl}$

303.79

4*H*-Dibenzo[*de,g*]quinoline-10,11-diol, 5,6,6a,7-tetrahydro-6-methyl-, hydrochloride, hemihydrate, (*R*)-;  
6a $\beta$ -Apomorphine-10,11-diol hydrochloride hemihydrate  
[41372-20-7].  
Anhydrous [314-19-2].

**DEFINITION**

Apomorphine Hydrochloride contains NLT 98.5% and NMT 101.5% of apomorphine hydrochloride ( $C_{17}H_{17}NO_2 \cdot HCl$ ), calculated on the dried basis.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197K)• **B. IDENTIFICATION TESTS—GENERAL**, Chloride (191)

**Sample solution:** 10 mg/mL of Apomorphine Hydrochloride in carbon dioxide-free water

**Analysis:** To 2 mL of the *Sample solution* add 0.1 mL of nitric acid. Mix, filter, and use the filtrate.

**Acceptance criteria:** Meets the requirements

**ASSAY**• **PROCEDURE**

**Sample solution:** Dissolve 250 mg of Apomorphine Hydrochloride in a mixture of 5.0 mL of 0.01 N hydrochloric acid and 50 mL of alcohol.

**Analysis:** Titrate the *Sample solution* with 0.1 N sodium hydroxide VS. Read the volume added between the first two points of inflexion. Each mL of 0.1 N sodium hydroxide is equivalent to 30.38 mg of apomorphine hydrochloride ( $C_{17}H_{17}NO_2 \cdot HCl$ ).

**Acceptance criteria:** 98.5%–101.5% on the dried basis

**IMPURITIES**• **RESIDUE ON IGNITION** (281): NMT 0.1%• **ORGANIC IMPURITIES**

**Diluent:** Glacial acetic acid and water (1:99)

**Solution A:** 1.1-g/L solution of sodium octanesulfonate, adjusted with diluted phosphoric acid (1:1) to a pH of 2.2

**Solution B:** Acetonitrile

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
2	85	15
32	68	32
37	68	32

Return to original conditions and re-equilibrate the system.

**System suitability solution:** 0.25 mg/mL each of USP Apomorphine Hydrochloride RS and boldine in *Diluent*.

[NOTE—Boldine is 2,9-dihydroxy-1,10-dimethoxyapomorphine.]

**Standard solution:** 2.5  $\mu$ g/mL of USP Apomorphine Hydrochloride RS in *Diluent*

**Sensitivity solution:** 0.14  $\mu$ g/mL of USP Apomorphine Hydrochloride RS in *Diluent* from the *Standard solution*. [NOTE—The peak response of this solution is equivalent to that of a solution containing 1.25  $\mu$ g/mL of morphine hydrochloride, taking into account the relative response factor of this impurity (see Table 2).]

**Sample solution:** 2.5 mg/mL of Apomorphine Hydrochloride in *Diluent*

**Chromatographic system**

(See Chromatography (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m end-capped packing  
L1

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Sensitivity solution*

[NOTE—The typical relative retention times for boldine and apomorphine are about 0.9 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.5 between boldine and apomorphine, *System suitability solution*

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Apomorphine Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

$r_u$  = peak response of each impurity from the *Sample solution*

$r_s$  = peak response of apomorphine from the *Standard solution*

$C_s$  = concentration of USP Apomorphine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Apomorphine Hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor (see Table 2)

**Acceptance criteria:** See Table 2. Disregard any peak below 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Morphine	0.4	0.11	0.15
Apomorphine	1.0	—	—
Any other individual impurity	—	1.0	0.10
Total impurities	—	—	0.5

**SPECIFIC TESTS**• **OPTICAL ROTATION**, *Specific Rotation* (781S)

**Sample solution:** 10 mg/mL in *Diluent*

**Diluent:** 2.06-g/L solution of hydrochloric acid in water

**Acceptance criteria:**  $-48^\circ$  to  $-52^\circ$ , determined at 20°

• **LOSS ON DRYING** (731)

**Analysis:** Dry a sample at 105° for 2 h.

**Acceptance criteria:** 2.0%–4.2%

• **COLOR OF SOLUTION**

**Sample solution:** Place 100 mg of Apomorphine Hydrochloride in a suitable test tube, add 10 mL of cold, oxygen-free water, and agitate gently until dissolved.

**Standard solution:** Dissolve 5 mg of Apomorphine Hydrochloride in 100.0 mL of water. Transfer 1.0 mL of this solution to a test tube of the same size as that used for the *Sample solution*. Dilute with 6 mL of water, add 1 mL of a 50-mg/mL sodium bicarbonate solution, and then add 0.50 mL of iodine TS. Allow to stand for 30 s, add 0.60 mL of a 25-mg/mL sodium thiosulfate solution, and dilute with water to 10 mL.

**Acceptance criteria:** The color of the *Sample solution*, observed promptly after the Apomorphine Hydrochloride has dissolved, is not more intense than that of a color of the *Standard solution*.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **USP REFERENCE STANDARDS** (11)  
USP Apomorphine Hydrochloride RS

## Apomorphine Hydrochloride Tablets

» Apomorphine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Apomorphine Hydrochloride RS

**Color of solution**—Dissolve a quantity of powdered Tablets, equivalent to 5 mg of apomorphine hydrochloride, in water to make 100.0 mL. Transfer 1.0 mL of the solution to a test tube, dilute with 6 mL of water, and, if necessary, filter through a small pledget of cotton. Add 1 mL of sodium bicarbonate solution (1 in 20), then add 0.50 mL of iodine TS. Allow to stand for 30 seconds, then add 0.60 mL of sodium thiosulfate solution (1 in 40), and dilute with water to 10 mL. This solution represents the color standard.

Place a quantity of powdered Tablets, equivalent to about 50 mg of apomorphine hydrochloride, in a test tube of suitably small size, add 10.0 mL of cold, oxygen-free water, insert the stopper in the test tube, and agitate gently until no more dissolves; if necessary, filter immediately through a small pledget of cotton. The color of the solution, observed promptly after preparation, is not more intense than that of the color standard. Use closely matched test tubes for the comparison.

**Identification**—To 5 mL of a filtered solution of Tablets, containing about 10 mg of apomorphine hydrochloride, add a slight excess of sodium bicarbonate solution (1 in 20): a white or greenish-white precipitate is formed. Add 3 drops of iodine TS, and shake vigorously: an emerald-green color is produced. Add 5 mL of ether, and, after vigorous shaking, allow the layers to separate: the ether is colored deep ruby-red while the water layer retains its green color.

**Disintegration** (701): 15 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Place 1 Tablet in a 500-mL volumetric flask containing 100 mL of 0.1 N hydrochloric acid, and shake for 15 minutes. Dilute with 0.1 N hydrochloric acid to volume, mix, and filter, discarding the first 20 mL of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.1 N hydrochloric acid to provide a solution containing approximately 12  $\mu$ g of apomorphine hydrochloride per mL. Concomitantly determine the absorbances of this solution and of a solution of USP Apomorphine Hydrochloride RS in the same medium having a known concentration of about 12  $\mu$ g of anhydrous apomorphine hydrochloride per mL, in 1-cm cells at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$  in the Tablet taken by the formula:

$$(312.80 / 303.79)(TC / D)(A_U / A_S)$$

in which 312.80 and 303.79 are the molecular weights of apomorphine hydrochloride hemihydrate and anhydrous apomorphine hydrochloride, respectively;  $T$  is the labeled quantity, in mg, of apomorphine hydrochloride in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of anhydrous apo-

morphine hydrochloride in the Standard solution;  $D$  is the concentration, in  $\mu$ g per mL, of apomorphine hydrochloride in the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Dissolve an accurately weighed portion of the powder, equivalent to about 50 mg of apomorphine hydrochloride, in 25 mL of water in a separator, add 500 mg of sodium bicarbonate, and completely extract with successive small portions of ether. Combine the ether extracts in a separator, and wash them with three 5-mL portions of water. Shake the combined water washings with 10 mL of ether, and add this ether to the combined ether extracts. Extract the ether solutions with 20.0 mL of 0.02 N sulfuric acid VS, and wash with three 5-mL portions of water. Combine the acid extract and washings in a beaker, and warm on a steam bath to expel any residual ether. Cool, add methyl red TS, and titrate the excess acid with 0.02 N sodium hydroxide VS (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.02 N sulfuric acid is equivalent to 6.256 mg of  $C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$ .

## Apraclonidine Hydrochloride

$C_9H_{10}Cl_2N_4 \cdot HCl$  281.57

1,4-Benzenediamine, 2,6-dichloro-N'-2-imidazolidinylidene-, monohydrochloride.

2-[(4-Amino-2,6-dichlorophenyl)imino]imidazolidine monohydrochloride [73218-79-8].

» Apraclonidine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_9H_{10}Cl_2N_4 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Apraclonidine Hydrochloride RS

**Identification**—

A: *Infrared Absorption* (197K).

B: It responds to the tests for *Chloride* (191).

**pH** (791): between 5.0 and 6.6 in a solution (1 in 100).

**Loss on drying** (731)—Dry it in vacuum at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Delete the following:**

• **Heavy metals, Method II** (231): 0.002%. • (Official 1-Jan-2018)

**Chromatographic purity**—

**Phosphate buffer**—Transfer 6.8 mL of phosphoric acid to a 2000-mL volumetric flask, add about 1900 mL of water, and mix. Adjust with sodium hydroxide solution (1 in 2) to a pH of 3.0, dilute with water to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, *Phosphate buffer*, and methanol (56:40:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Prepare a solution in *Mobile phase* containing about 0.8 mg of USP Apraclonidine Hydrochloride RS per mL.

**Test solution**—Transfer about 20 mg of Apraclonidine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and an 8-mm × 100-mm column that contains packing L7. The flow rate is about 3 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the tailing factor for the apraclonidine peak is not more than 2.2, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. [NOTE—Allow about five times the elution time of apraclonidine before making the next injection.] Calculate the percentage of each peak, other than the solvent peak and the apraclonidine peak, in the specimen of Apraclonidine Hydrochloride taken by the same formula:

$$100r_i / r_t$$

in which  $r_i$  is the response of each peak other than the principal peak, and  $r_t$  is the sum of the responses of all of the peaks, excluding that of the solvent peak: not more than 1.0% for any individual impurity and not more than 2.0% total impurities are found.

**Assay**—Dissolve about 125 mg of Apraclonidine Hydrochloride, accurately weighed, in 40 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically from the second inflection point, using a calomel-glass electrode system (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 14.08 mg of  $C_9H_{10}Cl_2N_4 \cdot HCl$ .

## Apraclonidine Ophthalmic Solution

» Apraclonidine Ophthalmic Solution is a sterile, aqueous solution of Apraclonidine Hydrochloride. It contains an amount of apraclonidine hydrochloride ( $C_9H_{10}Cl_2N_4 \cdot HCl$ ) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of apraclonidine ( $C_9H_{10}Cl_2N_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Apraclonidine Hydrochloride RS

### Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: Apply 2 µL of Apraclonidine Ophthalmic Solution and 2 µL of a Standard solution of USP Apraclonidine Hydrochloride RS in methanol containing about 11.5 mg per mL to a suitable high performance thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.2-mm layer of chromatographic silica gel mixture, or equivalent. Allow the

applications to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (74:22:4) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light. [NOTE—The apraclonidine spot should appear as a blue spot.] Spray the plate with fluorescamine solution, prepared by dissolving about 25 mg of fluorescamine in 25 mL of acetone. [NOTE—Avoid prolonged or repeated breathing of the aerosol from the fluorescamine spray. Also avoid prolonged or repeated contact with skin. Fluorescamine solution should be sprayed only in a hood.] Examine the plate under normal light and long-wavelength UV light. [NOTE—The apraclonidine spot should appear as a yellow spot under normal light and as a white spot under long-wavelength UV light.] The  $R_f$  value and appearance of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Sterility Tests** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.4 and 7.8.

### Assay—

**Phosphate buffer**—Prepare as directed in the test for *Chromatographic purity* under *Apraclonidine Hydrochloride*.

**Mobile phase**—Prepare a filtered and degassed mixture of *Phosphate buffer*, acetonitrile, and methanol (68:30:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Apraclonidine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a *Stock standard solution* having a known concentration of about 0.23 mg per mL. Transfer 2.5 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 11.5 µg of USP Apraclonidine Hydrochloride RS per mL (equivalent to about 10 µg of apraclonidine per mL).

**Resolution solution**—Transfer about 1 mL of propiophenone to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 3.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 1.0 mL of this solution and 5.0 mL of the *Stock standard solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 20 mg of apraclonidine, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.5 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and an 8-mm × 100-mm column that contains packing L7. The flow rate is about 3 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for apraclonidine and 1.0 for propiophenone; the column efficiency determined from the analyte peak is not less than 1000 theoretical plates; the tailing factor for the analyte peak is not more than 2.2; the resolution,  $R$ , between the analyte and propiophenone peaks is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in

mg, of apraclonidine ( $C_9H_{10}Cl_2N_4$ ) in each mL of the Ophthalmic Solution taken by the formula:

$$(245.11 / 281.57)(2C / V)(r_U / r_S)$$

in which 245.11 and 281.57 are the molecular weights of apraclonidine and apraclonidine hydrochloride, respectively; C is the concentration, in  $\mu\text{g}$  per mL, of USP Apraclonidine Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Ophthalmic Solution taken; and  $r_U$  and  $r_S$  are the apraclonidine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aprepitant

$C_{23}H_{21}F_7N_4O_3$

534.43

3H-1,2,4-Triazol-3-one, 5-[[[(2R,3S)-2-[(1R)-1-[3,5-bis(trifluoromethyl)phenyl]ethoxy]-3-(4-fluorophenyl)-4-morpholinyl]methyl]-1,2-dihydro-3-[[[(2R,3S)-3-(p-Fluorophenyl)-2-[( $\alpha$ R)- $\alpha$ -methyl-3,5-bis(trifluoromethyl)benzyl]oxy]morpholino]methyl]- $\Delta^2$ -1,2,4-triazolin-5-one; 3-[[[(2R,3S)-2-[(R)-1-[3,5-Bis(trifluoromethyl)phenyl]ethoxy]-3-(4-fluorophenyl)morpholino]methyl]-1H-1,2,4-triazol-5(4H)-one; 5-[[[(2R,3S)-2-[(R)-1-[3,5-Bis(trifluoromethyl)phenyl]ethoxy]-3-(4-fluorophenyl)-4-morpholinyl]methyl]-1,2-dihydro-3H-1,2,4-triazol-3-one [170729-80-3].

### DEFINITION

Aprepitant contains NLT 98.0% and NMT 102.0% of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ), calculated on the anhydrous and solvent-free basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION (197)**  
[NOTE—Methods described under *Infrared Absorption* (197K), (197M), or (197A) may be used.]
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Dilute phosphoric acid:** Dilute 1 mL of phosphoric acid with water to 1 L.

**Mobile phase:** Acetonitrile and *Dilute phosphoric acid* (48:52)

**Diluent:** Acetonitrile and *Dilute phosphoric acid* (50:50)  
**Standard solution:** 0.2 mg/mL of USP Aprepitant RS in *Diluent*; sonicate as needed

**Sample solution:** 0.2 mg/mL of Aprepitant in *Diluent*; sonicate as needed

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu\text{m}$  packing L1

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu\text{L}$

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 0.73%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ) in the portion of Aprepitant taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0%, on the anhydrous and solvent-free basis

### IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

#### • ORGANIC IMPURITIES

**Dilute phosphoric acid and Diluent:** Proceed as directed in the *Assay*.

**Solution A:** *Dilute phosphoric acid*

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	58	42
25	58	42
45	30	70
50	30	70

Return to original conditions and re-equilibrate the system.

**System suitability solution:** 2.0 mg/mL of USP Aprepitant RS and 0.003 mg/mL of USP Desfluoro Aprepitant RS in *Diluent*, using sonication as necessary to dissolve

**Sensitivity solution:** 0.001 mg/mL of USP Aprepitant RS in *Diluent*

**Standard solution:** 0.003 mg/mL of USP Aprepitant RS in *Diluent*, using sonication as necessary to dissolve

**Sample solution:** 2.0 mg/mL of Aprepitant in *Diluent*, using sonication as necessary to dissolve

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu\text{m}$  packing L1

**Column temperature:** 35°

**Flow rate:** 1.0 mL/min

**Injection volume:** 10  $\mu\text{L}$

#### System suitability

**Samples:** *System suitability solution*, *Sensitivity solution*, and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between the desfluoro aprepitant and aprepitant peaks, *System suitability solution*

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each individual impurity in the portion of Aprepitant taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response for aprepitant from the *Standard solution*

$C_S$  = concentration of USP Aprepitant RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aprepitant in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 2. Disregard any peak below 0.05%.

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Desfluoro aprepitant	0.85	0.15
Aprepitant	1.0	—
Any individual unspecified impurity	—	0.10
Total impurities	—	0.30

• **LIMIT OF *S,R,S*-ENANTIOMER** (if present)

[NOTE—Perform this test if this impurity is possible from the manufacturing process.]

**Mobile phase:** Hexane and dehydrated alcohol (90:10)

**System suitability solution:** 0.08 mg/mL of USP Aprepitant RS and 0.08 mg/mL of USP Aprepitant Related Compound B RS in *Mobile phase*

**Sample solution:** 0.5 mg/mL of Aprepitant in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; packing L51

**Column temperature:** 30°

**Flow rate:** 0.5 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** Greater than 2.0 between the enantiomer peaks. [NOTE—The elution order is the *S,R,S*-enantiomer followed by the aprepitant peak, which is the *R,S,R*-enantiomer.]

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of the *S,R,S*-enantiomer in the portion of Aprepitant taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of the *S,R,S*-enantiomer

$r_T$  = sum of the peak responses of aprepitant and the *S,R,S*-enantiomer

**Acceptance criteria:** NMT 0.10% of the *S,R,S*-enantiomer

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method Ia or Ic (921):** NMT 0.5%

• **OPTICAL ROTATION, Specific Rotation (781S)**

**Sample solution:** 10 mg/mL in methanol

**Acceptance criteria:** +66.0° to +71.0°

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at room temperature.

• **USP REFERENCE STANDARDS (11)**

USP Aprepitant RS

USP Aprepitant Related Compound B RS

*S,R,S*-Enantiomer: 3-[[[(2*S*,3*R*)-2-[(*S*)-1-[3,5-Bis(trifluoromethyl)phenyl]ethoxy]-3-(4-fluorophenyl)morpholino]methyl]-1*H*-1,2,4-triazol-5(4*H*)-one.

USP Desfluoro Aprepitant RS

5-[[[(2*R*,3*S*)-2-[(*R*)-1-[3,5-Bis(trifluoromethyl)phenyl]ethoxy]-3-phenylmorpholino]methyl]-2*H*-1,2,4-triazol-3(4*H*)-one.

$C_{23}H_{22}F_6N_4O_3$  516.44

**Aprepitant Capsules****DEFINITION**

Aprepitant Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ).

**IDENTIFICATION**

• **A. ULTRAVIOLET ABSORPTION (197U)**

**Wavelength range:** 200–400 nm

**Standard solution:** 0.1 mg/mL of USP Aprepitant RS in methanol. Use sonication to dissolve.

**Sample solution:** Transfer the contents of Capsules, equivalent to 100 mg of aprepitant, to a 100-mL volumetric flask, add about 75 mL of methanol, and sonicate for about 5 min with intermittent shaking. Cool, dilute with methanol to volume, further dilute with methanol to obtain a solution containing 0.1 mg/mL of aprepitant, and pass through a nylon filter of 0.45-µm pore size.

**Acceptance criteria:** Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**

• **PROCEDURE**

**Dilute phosphoric acid:** Dilute 1 mL of phosphoric acid with water to 1 L.

**Mobile phase:** Acetonitrile and *Dilute phosphoric acid* (45:55)

**Standard solution:** 0.05 mg/mL of USP Aprepitant RS in *Mobile phase*. Use sonication as necessary to dissolve.

**Sample solution:** Nominally 0.05 mg/mL of aprepitant in *Mobile phase*, prepared as follows. Mix the contents of NLT 20 Capsules, and transfer a portion of the contents, equivalent to 100 mg of aprepitant, to a 100-mL volumetric flask. Add about 75 mL of *Mobile phase* and sonicate for about 10 min with intermittent shaking. Cool, dilute to volume with *Mobile phase*, further dilute with *Mobile phase* to obtain a solution containing 0.05 mg/mL of aprepitant, and pass through a nylon filter of 0.45-µm pore size.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Aprepitant RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aprepitant in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

Test 1

Medium: 2.2% Sodium dodecyl sulfate in water; 900 mL

Apparatus 2: 100 rpm, with sinkers. [NOTE—A suitable sinker is available from VanKel, www.chem.agilent.com, catalog number 12-3050. Proper placement of the Capsules is in the sinkers with the cap facing the fixed prong end.]

Time: 20 min

Dilute phosphoric acid: Dilute 1 mL of phosphoric acid with water to 1 L.

Mobile phase: Acetonitrile and *Dilute phosphoric acid* (50:50)

Standard solution: ( $L/900$ ) mg/mL of USP Aprepitant RS in *Medium*, where  $L$  is the label claim in mg/Capsule. Dissolve first in a minimal amount of methanol (using NMT 2% of the final volume) prior to diluting with *Medium*.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 50 μL for Capsules containing 40 mg/Capsule; 10 μL for all other strengths

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Aprepitant RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Capsule)

Tolerances: NLT 80% ( $Q$ ) of the labeled amount of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ) is dissolved.

Test 2

Medium: 2.2% Sodium dodecyl sulfate in water; 900 mL

Apparatus 2: 100 rpm, with wire helix sinkers or other suitable sinkers

Time: 30 min

Dilute phosphoric acid and Mobile phase: Proceed as directed in the *Assay*.

Standard solution: ( $L/900$ ) mg/mL of USP Aprepitant RS in *Medium*, where  $L$  is the label claim in mg/Capsule. Dissolve first in a minimal amount of methanol (using NMT 2% of the final volume) prior to diluting with *Medium*.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

Chromatographic system: Proceed as directed in the *Assay*, except use an autosampler temperature of 15°.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Aprepitant RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Capsule)

Tolerances: NLT 80% ( $Q$ ) of the labeled amount of aprepitant ( $C_{23}H_{21}F_7N_4O_3$ ) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

## IMPURITIES

### • ORGANIC IMPURITIES

Dilute phosphoric acid: Dilute 1 mL of phosphoric acid with water to 1 L.

Solution A: Acetonitrile and *Dilute phosphoric acid* (5:95)

Solution B: Acetonitrile and *Dilute phosphoric acid* (95:5)

Diluent: Acetonitrile and *Dilute phosphoric acid* (50:50)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
20	58	42
25	35	65
33	35	65

Return to original conditions and re-equilibrate the system for 10 min.

System suitability solution: 0.6 mg/mL of USP Aprepitant RS and 0.0012 mg/mL each of USP Desfluoro Aprepitant RS and USP Aprepitant Related Compound A RS in *Diluent*

Standard solution: 0.0012 mg/mL of USP Aprepitant RS in *Diluent*

Sample solution: Nominally 0.6 mg/mL of aprepitant, prepared as follows. Transfer the contents of Capsules, equivalent to 120 mg of aprepitant, to a 200-mL volumetric flask, add about 150 mL of *Diluent*, and sonicate for about 10 min with intermittent shaking. Cool, dilute

with Diluent to volume, and pass through a nylon filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

Column temperature: 35°

Flow rate: 1.0 mL/min

Injection volume: 10  $\mu$ L

#### System suitability

Samples: System suitability solution and Standard solution

#### Suitability requirements

Resolution: NLT 3.0 between the desfluoro aprepitant and aprepitant peaks, System suitability solution

Relative standard deviation: NMT 5.0%, Standard solution

#### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of any individual impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of each impurity from the Sample solution  
 $r_S$  = peak response of aprepitant from the Standard solution  
 $C_S$  = concentration of USP Aprepitant RS in the Standard solution (mg/mL)  
 $C_U$  = nominal concentration of aprepitant in the Sample solution (mg/mL)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Desfluoro aprepitant	0.85	— <sup>a</sup>
Aprepitant	1.0	—
Aprepitant diastereomers (R,R,R and R,S,S) <sup>b</sup>	1.3	— <sup>a</sup>
Any other individual impurity	—	0.2
Total impurities	—	0.2

<sup>a</sup> Process impurity included in the table for identification only. Process impurities are controlled in the drug substance, and are not to be reported or included in the total impurities for the drug product.

<sup>b</sup> The diastereomers are not separated by this procedure and should be identified based on the retention time of aprepitant related compound A (R,R,R-diastereomer), which is a component of the System suitability solution.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **LABELING:** When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**
  - USP Aprepitant RS
  - USP Aprepitant Related Compound A RS
  - R,R,R-Diastereomer: 3-[[[(2R,3R)-2-[(R)-1-[3,5-Bis(trifluoromethyl)phenyl]ethoxy]-3-(4-fluorophenyl)morpholino]methyl]-1H-1,2,4-triazol-5(4H)-one. C<sub>23</sub>H<sub>21</sub>F<sub>7</sub>N<sub>4</sub>O<sub>3</sub> 534.43

Trypsin inhibitor, pancreatic basic;

L-Arginyl-L-prolyl-L-aspartyl-L-phenylalanyl-L-cysteinyll-L-leucyl-L-glutamyl-L-prolyl-L-prolyl-L-tyrosyl-L-threonylglycyl-L-prolyl-L-cysteinyll-L-lysyl-L-alanyl-L-arginyl-L-isoleucyl-L-isoleucyl-L-arginyl-L-tyrosyl-L-phenylalanyl-L-tyrosyl-L-asparaginyll-L-alanyl-L-lysyl-L-alanylglycyl-L-leucyl-L-cysteinyll-L-glutaminyll-L-threonyll-L-phenylalanyl-L-valyl-L-tyrosylglycylglycyl-L-cysteinyll-L-arginyl-L-alanyl-L-lysyl-L-arginyl-L-asparaginyll-L-asparaginyll-L-phenylalanyl-L-lysyl-L-seryl-L-alanyl-L-glutamyl-L-aspartyl-L-cysteinyll-L-methionyl-L-arginyl-L-threonyll-L-cysteinyllglycylglycyl-L-alanine cyclic (5→55), (14→38), (30→51) tris(disulfide) [9087-70-1].

#### DEFINITION

Aprotinin is a polypeptide consisting of a chain of 58 amino acid residues, which inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin, and trypsin. Aprotinin is obtained from bovine tissues and purified by a suitable process, and is stored as a bulk solution or lyophilized powder. Its potency, calculated on the dried basis, is NLT 3 USP Aprotinin Units/mg. In addition, the method of manufacture is validated to result in NMT 0.2  $\mu$ g of histamine per 3 USP Aprotinin Units using validated methods. The origin and sourcing of bovine material must be specified in compliance with FDA requirements. The manufacturing process is validated to demonstrate the clearance of potential infectious agents (i.e., viruses, TSE agents). One USP Aprotinin Unit is equivalent to 1800 Kallikrein Inhibition Units (K.I.U.).

#### IDENTIFICATION

##### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Cupric chloride solution: 10 mg/mL of cupric chloride

Sample solution: A solution of Aprotinin in water containing about 15 USP Aprotinin Units/mL

##### Chromatographic system

Developing solvent system: To a mixture of glacial acetic acid and water (5:4) add 100 g/L of sodium acetate.

Spray reagent: Dissolve 0.1 g of ninhydrin in a mixture containing 6 mL of Cupric chloride solution, 21 mL of glacial acetic acid, and 70 mL of alcohol.

Analysis: Proceed as directed in the chapter, except spray the plate with the Spray reagent, and heat at 60° to visualize the spots.

- **B.** The retention time of the major peak of the Sample solution corresponds to that of the System suitability solution, as obtained in Limit of N-Pyroglutamyl-Aprotinin and Related Compounds.

#### ASSAY

##### • PROCEDURE

Buffer: Transfer about 0.93 g of boric acid into a 1000-mL volumetric flask, dissolve in 900 mL of water, adjust with 5 N sodium hydroxide to a pH of 8.0, and dilute with water to volume. Transfer 100 mL of this solution into a 1000-mL volumetric flask, and dilute with water to volume.

Sample solution: A solution of Aprotinin in Buffer containing about 1.67 USP Aprotinin Units/mL (about 0.6 mg/mL)

Trypsin solution: 4300 USP Trypsin Units/mL of USP Trypsin Crystallized RS in 0.001 N hydrochloric acid. Use a freshly prepared solution, and store in ice water.

**Trypsin and aprotinin solution:** To 4.0 mL of the *Trypsin solution* add 1.0 mL of the *Sample solution*. Dilute immediately with *Buffer* to 40.0 mL. Allow to stand at room temperature for 10 min, then keep in ice water. Use within 6 h of preparation.

**Dilute trypsin solution:** Dilute 0.5 mL of the *Trypsin solution* with *Buffer* to 10.0 mL. Allow to stand at room temperature for 10 min, then store in ice water.

**Substrate solution:** 6.9 mg/mL of *N*-benzoyl-L-arginine ethyl ester hydrochloride in water. Use within 2 h.

**Analysis:** Mix 9.0 mL of *Buffer* and 1.0 mL of *Substrate solution* in a jacketed glass vessel with a capacity of about 30 mL and containing a stirring device. The lid of the reaction vessel should contain five holes to accommodate the electrodes, the tip of a buret, a tube for the admission of nitrogen, and the introduction of reactants. An automated or manual titration apparatus may be used. Adjust with 0.1 N sodium hydroxide VS to a pH of 8.0. Maintain an atmosphere of nitrogen within the vessel, and stir continuously. When the temperature has reached equilibrium at  $25 \pm 0.1^\circ$ , add 1.0 mL of *Trypsin and aprotinin solution*, and start a timer. Maintain at a pH of 8.0 by the addition of 0.1 N sodium hydroxide VS, and record the volume added every 30 s. Continue the reaction for 6 min. Carry out a similar titration using 1.0 mL of the *Dilute trypsin solution*.

For the lyophilized powder, calculate the aprotinin activity in USP Aprotinin Units/mg:

$$\text{Result} = F_1 \times [(F_2 \times n_2 - n_1)/m]$$

$F_1$  = conversion factor, 4000

$F_2$  = difference in the amount of trypsin used in *Trypsin and aprotinin solution* and *Dilute trypsin solution*, 2

$n_2$  = volume of 0.1 N sodium hydroxide added per second, after adding *Dilute trypsin solution* (mL/s)

$n_1$  = volume of 0.1 N sodium hydroxide added per second, after adding *Trypsin and aprotinin solution* (mL/s)

$m$  = quantity of Aprotinin used to prepare 1 mL of the *Sample solution* (mg)

For the concentrated solution, calculate the USP Aprotinin Units/mL:

$$\text{Result} = F_1 \times (F_2 \times n_2 - n_1) \times D$$

$F_1$  = conversion factor, 4000

$F_2$  = difference in the amount of trypsin used in *Trypsin and aprotinin solution* and *Dilute trypsin solution*, 2

$n_2$  = volume of 0.1 N sodium hydroxide added per second, after adding *Dilute trypsin solution* (mL/s)

$n_1$  = volume of 0.1 N sodium hydroxide added per second, after adding *Trypsin and aprotinin solution* (mL/s)

$D$  = dilution factor of the concentrated solution used to prepare the *Sample solution*

**Acceptance criteria:** NLT 3 USP Aprotinin Units/mg on the dried basis

## IMPURITIES

### • LIMIT OF des-ALA-APROTIMIN AND des-ALA-des-GLY-APROTIMIN

**Buffer:** Dissolve 8.21 g of monobasic potassium phosphate in 400 mL of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 500 mL.

**System suitability solution:** Dilute USP Aprotinin RS with water to obtain a solution containing about 4–7 USP Aprotinin Units/mL.

**Sample solution:** Dilute a concentrated solution of Aprotinin with water, or weigh out Aprotinin and dis-

solve in water to obtain about 4–7 USP Aprotinin Units/mL of Aprotinin.

**Capillary rinse procedure:** Rinse the capillary for NLT 1 min with NLT 10 total capillary volumes of 0.1 N sodium hydroxide, followed by at least 10 total capillary volumes of water and by at least 20 capillary volumes of *Buffer* between injections.

### Electrophoretic system

**Mode:** CE

**Detector:** UV 214 nm

**Capillary:** 75- $\mu$ m  $\times$  45- to 60-cm uncoated fused silica. Use *Buffer* as the electrolyte in both buffer reservoirs.

**Capillary temperature:**  $25^\circ$

**Injection procedure:** Transfer a volume of the *Sample solution*, approximately 15 nL, into the anodic end of the capillary. Apply differential pressure of 3.5 kPa for 3 s either by vacuum or pressure.

**Applied voltage:** 0.2 kV/cm

**Run time:** 30 min

**System suitability:** The baseline is stable and shows little drift.

**Sample:** *System suitability solution*

### Suitability requirements

**Migration time:** 19–25 min for aprotinin

**Relative migration times:** About 0.98 for des-Ala-des-Gly-aprotinin, 0.99 for des-Ala-aprotinin, and 1 for aprotinin

**Resolution:** NLT 0.8 between the des-Ala-des-Gly-aprotinin and des-Ala-aprotinin peaks, and NLT 0.5 between the des-Ala-aprotinin and aprotinin peaks

**Tailing factor:** NMT 3 for aprotinin (see *Chromatography* (621) for calculation)

### Analysis

**Sample:** *Sample solution*

Calculate the percentage of des-Ala-des-Gly-aprotinin and des-Ala-aprotinin:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of des-Ala-des-Gly-aprotinin or des-Ala-aprotinin

$r_T$  = sum of the peak responses of des-Ala-des-Gly-aprotinin, des-Ala-aprotinin, and aprotinin

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Migration Time	Acceptance Criteria, NMT (%)
des-Ala-des-Gly- aprotinin	0.98	8.0
des-Ala-aprotinin	0.99	7.5
Aprotinin	1	—

### • LIMIT OF N-PYROGLUTAMYL-APROTIMIN AND RELATED COMPOUNDS

**Solution A:** 3.52 g/L of monobasic potassium phosphate and 7.26 g/L of dibasic sodium phosphate. Filter, and degas.

**Solution B:** 3.52 g/L of monobasic potassium phosphate, 7.26 g/L of dibasic sodium phosphate, and 66.07 g/L of ammonium sulfate. Filter, and degas.

**Mobile phase:** See *Table 2*.

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	92	8
21	64	36
30	0	100

Table 2 (Continued)

Time (min)	Solution A (%)	Solution B (%)
31	92	8
40	92	8

**System suitability solution:** USP Aprotinin System Suitability RS in Solution A, with 5 USP Aprotinin Units/mL

**Sample solution:** Aprotinin in Solution A, with 5 USP Aprotinin Units/mL

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 7.5-mm × 7.5-cm; packing L52

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection volume:** 40 µL

#### System suitability

**Sample:** System suitability solution

#### Suitability requirements

**Retention time:** 17–20 min for aprotinin

**Relative retention times:** 0.9 and 1.0 for N-pyroglutamyl-protinin and aprotinin, respectively

**Resolution:** NLT 1.0 between N-pyroglutamyl-protinin and aprotinin

**Tailing factor:** NMT 2.0 for aprotinin

#### Analysis

**Sample:** Sample solution

Calculate the percentage of each impurity peak:

$$\text{Result} = (r_u/r_T) \times 100$$

$r_u$  = peak response of each impurity

$r_T$  = sum of all the peak responses from the Sample solution

**Acceptance criteria:** See Table 3.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
N-Pyroglutamyl-protinin	0.9	1.0
Aprotinin	1.0	—
Any other impurity	—	0.5
Sum of all unknown impurities	—	1.0

#### • LIMIT OF HIGH MOLECULAR WEIGHT PROTEINS

**Mobile phase:** Acetonitrile, glacial acetic acid, and water (1:1:3). Filter and degas.

**System suitability solution:** Aprotinin solution that contains about 5 USP Aprotinin Units/mL with about 2% aprotinin oligomers. [NOTE—This solution can be obtained by heating lyophilized aprotinin at 112° for about 2 h and dissolving the solid at the specified concentration in water.]

**Sample solution:** Aprotinin in water, with about 5 USP Aprotinin Units/mL

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 280 nm

**Columns:** Series of three 7.8-mm × 30-cm columns; packing L33

**Flow rate:** 1.0 mL/min

**Injection volume:** 100 µL

#### System suitability

**Sample:** System suitability solution

#### Suitability requirements

**Retention time:** 24.5–25.5 min for aprotinin

**Relative retention times:** 0.9 and 1.0 for the dimer and aprotinin, respectively

**Resolution:** NLT 1.3 between the dimer and aprotinin peaks

**Tailing factor:** NMT 2.5 for aprotinin

#### Analysis

**Sample:** Sample solution

Calculate the percentage of each oligomer peak:

$$\text{Result} = (r_u/r_T) \times 100$$

$r_u$  = response of each peak with a retention time less than that of the aprotinin monomer

$r_T$  = sum of all the peak responses

**Acceptance criteria:** Sum of all the oligomer peak responses is NMT 1.0%.

#### SPECIFIC TESTS

##### • ABSORBANCE

(See Ultraviolet-Visible Spectroscopy (857).)

**Sample solution:** 3.0 USP Aprotinin Units/mL

**Acceptance criteria:** The Sample solution exhibits an absorption maximum at 277 nm. The absorbance at the maximum is NMT 0.80.

##### • BIOLOGICAL REACTIVITY TESTS, IN VIVO, Safety Tests—Biologicals (88)

**Sample solution:** Prepare a solution of Aprotinin that contains 4 USP Aprotinin Units/mL using a sufficient quantity of Water for Injection.

**Acceptance criteria:** Meets the requirements

##### • SPECIFIC ACTIVITY OF THE DRY RESIDUE

This test should only be performed when product is a concentrated solution.

**Sample solution:** 25.0 mL of Aprotinin concentrated solution

**Analysis:** Evaporate the Sample solution to dryness in a water bath, dry the residue at 110° for 15 h, and weigh. From the weight of the residue and the activity determined in the Assay, calculate the number of USP Aprotinin Units/mg of dry residue.

**Acceptance criteria:** NLT 3.0 USP Aprotinin Units/mg of dried residue

##### • LOSS ON DRYING (731)

This test should only be performed on the lyophilized powder.

**Sample:** 100 mg

**Analysis:** Dry the Sample in a capillary-stoppered bottle under vacuum at a pressure of NMT 5 mm of mercury at 60° for 3 h.

**Acceptance criteria:** NMT 6.0%

##### • BACTERIAL ENDOTOXINS TEST (85)

**Sample solution:** 6 USP Aprotinin Units/mL

**Acceptance criteria:** NMT 0.14 USP Endotoxin Unit per USP Aprotinin Unit

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** For lyophilized powder, preserve in tight containers, and store in a cold place. Protect from light. For bulk solution, preserve in tight containers at a temperature not exceeding 25°. Avoid freezing.

• **LABELING:** The labeling states the source of the material and the number of Kallikrein Inhibition Units/mg or the number of Kallikrein Inhibition Units/mL.

- **USP REFERENCE STANDARDS (11)**
  - USP Aprotinin RS
  - USP Aprotinin System Suitability RS
  - USP Endotoxin RS
  - USP Trypsin Crystallized RS

## Aprotinin Injection

### DEFINITION

Aprotinin Injection is a sterile solution of Aprotinin in Water for Injection that also contains sodium chloride. One USP Aprotinin Unit is equivalent to 1800 Kallikrein Inhibition Units (K.I.U.). It contains NLT 90.0% and NMT 110.0% of the potency stated on the label, expressed in K.I.U./mL.

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the test for *Limit of N-Pyroglutamyl-Aprotinin and Related Compounds*.
- **B.** It meets the requirements in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** Transfer about 0.93 g of boric acid into a 1000-mL volumetric flask, dissolve in 900 mL of water, adjust with 5 N sodium hydroxide to a pH of 8.0, and dilute with water to volume. Transfer 100 mL of this solution into a 1000-mL volumetric flask, and dilute with water to volume.

**Sample solution:** A solution of aprotinin in *Buffer* containing about 1.67 USP Aprotinin Units/mL (about 0.6 mg/mL).

**Trypsin solution:** 4300 USP Trypsin Units/mL of USP Trypsin Crystallized RS in 0.001 N hydrochloric acid. Use a freshly prepared solution, and store in ice water.

**Trypsin and aprotinin solution:** To 4.0 mL of the *Trypsin solution*, add 1.0 mL of the *Sample solution*. Dilute immediately with *Buffer* to 40.0 mL. Allow to stand at room temperature for 10 min, then keep in ice water. Use within 6 h of preparation.

**Dilute trypsin solution:** Dilute 0.5 mL of the *Trypsin solution* with *Buffer* to 10.0 mL. Allow to stand at room temperature for 10 min, then store in ice water.

**Substrate solution:** 6.9 mg/mL of *N*-benzoyl-L-arginine ethyl ester hydrochloride. Use within 2 h.

**Analysis:** Mix 9.0 mL of *Buffer* and 1.0 mL of *Substrate solution* in a jacketed-glass vessel with a capacity of about 30 mL and containing a stirring device. The lid of the reaction vessel should contain five holes to accommodate the electrodes, the tip of a buret, a tube for the admission of nitrogen, and the introduction of reactants. An automated or manual titration apparatus may be used. Adjust with 0.1 N sodium hydroxide VS to a pH of 8.0. Maintain an atmosphere of nitrogen within the vessel, and stir continuously. When the temperature has reached equilibrium at  $25 \pm 0.1^\circ$ , add 1.0 mL of *Trypsin and aprotinin solution*, and start a timer. Maintain at a pH of 8.0 by the addition of 0.1 N sodium hydroxide VS, and record the volume added every 30 s. Continue the reaction for 6 min. Carry out a similar titration using 1.0 mL of the *Dilute trypsin solution*. Calculate the potency in USP Aprotinin Units/mL:

$$\text{Result} = F_1 \times (F_2 \times n_2 - n_1) \times D$$

$F_1$  = conversion factor, 4000

$F_2$  = difference in the amount of trypsin used in *Trypsin and aprotinin solution* and *Dilute trypsin solution*, 2

$n_2$  = volume of 0.1 N sodium hydroxide added per second, after adding *Dilute trypsin solution* (mL/s)

$n_1$  = volume of 0.1 N sodium hydroxide added per second, after adding *Trypsin and aprotinin solution* (mL/s)

$D$  = dilution factor used to prepare the *Sample solution*

**Acceptance criteria:** 90.0%–110.0% of the potency stated on the label, expressed in K.I.U./mL

### OTHER COMPONENTS

#### CONTENT OF SODIUM CHLORIDE

**Sample:** 5.0 mL of Injection

**Analysis:** Pipet the *Sample* into a beaker containing 50 mL of water. Add 10 mL of 25% nitric acid. Titrate with 0.1 N silver nitrate VS to a potentiometric endpoint, using a silver combination electrode. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride.

**Acceptance criteria:** 42.5–47.5 mg

### IMPURITIES

#### LIMIT OF N-PYROGLUTAMYL-APROTIMIN AND RELATED COMPOUNDS

**Solution A:** 3.52 g/L of monobasic potassium phosphate and 7.26 g/L of dibasic sodium phosphate. Filter, and degas.

**Solution B:** 3.52 g/L of monobasic potassium phosphate, 7.26 g/L of dibasic sodium phosphate, and 66.07 g/L of ammonium sulfate. Filter, and degas.

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	92	8
21	64	36
30	0	100
31	92	8
40	92	8

**System suitability solution:** USP Aprotinin System Suitability RS in *Solution A* with 5 USP Aprotinin Units/mL

**Sample solution:** Aprotinin in *Solution A*, with 5 USP Aprotinin Units/mL

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 7.5-mm × 7.5-cm; packing L52

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection volume:** 40 µL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Retention time:** 17–20 min for aprotinin

**Relative retention times:** 0.9 and 1.0 for *N*-pyroglutamyl-aprotinin and aprotinin, respectively

**Resolution:** NLT 1.0 between *N*-pyroglutamyl-aprotinin and aprotinin

**Tailing factor:** NMT 2.0 for the aprotinin peak

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity peak:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity

$r_T$  = sum of all the peak responses from the *Sample solution*

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
N-Pyroglutamyl- aprotinin	0.9	1.0
Aprotinin	1.0	—
Any other impurity	—	0.5
Sum of all unknown impurities	—	1.0

• **LIMIT OF HIGH MOLECULAR WEIGHT PROTEINS**

**Mobile phase:** Acetonitrile, glacial acetic acid, and water (1:1:3). Filter, and degas.

**System suitability solution:** Aprotinin solution that contains about 5 USP Aprotinin Units/mL with about 2% aprotinin oligomers. [NOTE—This solution can be obtained by heating lyophilized aprotinin at 112° for about 2 h and dissolving the solid at the specified concentration in water.]

**Sample solution:** Aprotinin in water, with 5 USP Aprotinin Units/mL

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** Series of three 7.8-mm × 30-cm columns; packing L33

**Flow rate:** 1.0 mL/min

**Injection volume:** 100 μL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Retention time:** 24.5–25.5 min for aprotinin

**Relative retention times:** 0.9 and 1.0 for the dimer and aprotinin, respectively

**Resolution:** NLT 1.3 between the dimer and aprotinin peaks

**Tailing factor:** NMT 2.5 for the aprotinin peak

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each oligomer peak:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = response of each peak with a retention time less than that of the aprotinin monomer

$r_T$  = sum of all the peak responses

**Acceptance criteria:** Sum of all the oligomer peak responses is NMT 1.5%.

**SPECIFIC TESTS**

• **STERILITY TESTS** <71>: It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined*, *Membrane Filtration*.

• **PARTICULATE MATTER IN INJECTIONS** <788>: Meets the requirements

• **PH** <791>: 4.5–6.5

• **INJECTIONS AND IMPLANTED DRUG PRODUCTS** <1>: Meets the requirements

• **BACTERIAL ENDOTOXINS TEST** <85>: It contains NMT 0.14 USP Endotoxin Units per USP Aprotinin Unit.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in single-dose containers. Store at up to 25°, and avoid freezing.

## Argatroban

$C_{23}H_{36}N_6O_5S \cdot H_2O$  526.65

2-Piperidinecarboxylic acid, 1-[(S)-5-[(aminoiminomethyl)amino]-1-oxo-2-[[[1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]amino]pentyl]-4-methyl-, (2R,4R)-monohydrate;

(2R,4R)-4-Methyl-1-{N<sup>2</sup>-[(1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]-L-arginyl}pipecolic acid, monohydrate [141396-28-3].

**DEFINITION**

Argatroban contains NLT 98.0% and NMT 102.0% of argatroban ( $C_{23}H_{36}N_6O_5S$ ), calculated on the anhydrous and solvent-free basis.

**IDENTIFICATION**

• **A. INFRARED ABSORPTION** <197K>

• **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

• **PROCEDURE**

[NOTE—It is recommended to keep all solutions containing argatroban at about 4°.]

**Solution A:** 10 mM ammonium acetate and 5 mM sodium 1-heptanesulfonate

**Solution B:** Acetonitrile and methanol (500:300)

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
20	60	40
35	50	50
50	20	80
60	20	80
60.1	60	40
72.1	60	40

**Standard solution:** 4 mg/mL of USP Argatroban RS in methanol

**Sample solution:** 4 mg/mL of Argatroban in methanol

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC  
 Detector: UV 259 nm  
 Column: 4.6-mm × 25-cm; 3-μm packing L1  
 Temperatures  
 Column: 50°  
 Autosampler: 4°  
 Flow rate: 0.6 mL/min  
 Injection volume: 10 μL  
 System suitability  
 Sample: *Standard solution*  
 Suitability requirements  
 Tailing factor: NMT 1.5 for both peaks  
 Relative standard deviation: NMT 1.0% for the sum of the peak responses of (R)-argatroban and (S)-argatroban

#### Analysis

Samples: *Standard solution* and *Sample solution*  
 Calculate the percentage of argatroban (C<sub>23</sub>H<sub>36</sub>N<sub>6</sub>O<sub>5</sub>S) in the portion of Argatroban taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = sum of the peak responses of (R)-argatroban and (S)-argatroban from the *Sample solution*

$r_S$  = sum of the peak responses of (R)-argatroban and (S)-argatroban from the *Standard solution*

$C_S$  = concentration of USP Argatroban RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Argatroban in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

#### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

#### • ORGANIC IMPURITIES

[NOTE—It is recommended to keep all solutions containing argatroban at about 4°.]

Mobile phase, *Sample solution*, and *Chromatographic system*: Proceed as directed in the *Assay*.

Sensitivity solution: 2 μg/mL of USP Argatroban RS in methanol

Standard solution: 4 μg/mL each of USP Argatroban RS, USP Argatroban Related Compound A RS, and USP Argatroban Related Compound B RS in methanol

#### System suitability

Samples: *Sensitivity solution* and *Standard solution*

#### Suitability requirements

Resolution: NLT 1.2 between (R)-argatroban and (S)-argatroban, *Standard solution*

Signal-to-noise ratio: NLT 10 for (R)-argatroban, *Sensitivity solution*

Relative standard deviation: NMT 5% for all peaks. For argatroban, use the sum of the peak responses of (R)-argatroban and (S)-argatroban, *Standard solution*.

#### Analysis

Samples: *Standard solution* and *Sample solution*  
 Calculate the percentage of argatroban related compound A and argatroban related compound B in the portion of Argatroban taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of argatroban related compound A or argatroban related compound B from the *Sample solution*

$r_S$  = peak response of argatroban related compound A or argatroban related compound B from the *Standard solution*

$C_S$  = concentration of USP Argatroban Related Compound A RS or USP Argatroban Related Compound B RS in the *Standard solution*. (mg/mL)

$C_U$  = concentration of Argatroban in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Argatroban taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any unspecified impurity from the *Sample solution*

$r_S$  = sum of the peak responses of (R)-argatroban and (S)-argatroban from the *Standard solution*

$C_S$  = concentration of USP Argatroban RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Argatroban in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2. Disregard any peak below 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Argatroban related compound A <sup>a</sup>	0.23	0.15
Argatroban related compound B <sup>b</sup>	0.39	0.15
(R)-Argatroban <sup>c</sup>	1.00	—
(S)-Argatroban <sup>d</sup>	1.03	—
Any unspecified impurity	—	0.10
Total impurities <sup>e</sup>	—	0.5

<sup>a</sup> (2R,4R)-1-[N<sup>o</sup>-Nitro-N<sup>2</sup>-(3-methylquinoline-8-sulfonyl)-L-arginyl]-4-methylpiperidine-2-carboxylic acid.

<sup>b</sup> Ethyl (2R,4R)-1-[N<sup>o</sup>-nitro-L-arginyl]-4-methylpiperidine-2-carboxylate hydrochloride.

<sup>c</sup> (2R,4R)-4-Methyl-1-[N<sup>2</sup>-[[(R)-1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]-L-arginyl]pipecolic acid.

<sup>d</sup> (2R,4R)-4-Methyl-1-[N<sup>2</sup>-[[(S)-1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]-L-arginyl]pipecolic acid.

<sup>e</sup> Total impurities include specified and unspecified impurities and argatroban related compound C from the test for *Content of Argatroban Related Compound C*.

#### • CONTENT OF ARGATROBAN RELATED COMPOUND C

[NOTE—It is recommended to keep all solutions containing argatroban at about 4°.]

Buffer: 10 mM ammonium acetate and 5 mM sodium 1-heptanesulfonate

Solution A: Acetonitrile, dehydrated alcohol, and *Buffer* (80:240:680)

Mobile phase: See Table 3.

Table 3

Time (min)	Solution A (%)	Acetonitrile (%)
0	100	0
70	100	0
71	30	70
91	30	70
92	100	0
102	100	0

Sensitivity solution: 4 μg/mL of USP Argatroban Related Compound C RS in methanol

System suitability solution: 10 mg/mL of USP Argatroban RS and 0.1 mg/mL of USP Argatroban Related Compound C RS in methanol

Sample solution: 10 mg/mL of Argatroban in methanol  
 Chromatographic system: Proceed as directed in the *Assay*.

**System suitability**

**Samples:** Sensitivity solution and System suitability solution

**Suitability requirements**

**Resolution:** NLT 1.4 between argatroban related compound C and (R)-argatroban, *System suitability solution*

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Relative standard deviation:** NMT 2.5% for argatroban related compound C, *System suitability solution*

**Analysis**

**Sample:** Sample solution

Calculate the percentage of argatroban related compound C in the portion of Argatroban taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of argatroban related compound C from the *Sample solution*

$r_T$  = total of all peak responses from the *Sample solution*

**Acceptance criteria:** See Table 4.

**Table 4**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Argatroban related compound C <sup>a</sup>	0.94	0.15
(R)-Argatroban	1.00	—
(S)-Argatroban	1.07	—

<sup>a</sup> (2R,4R)-1-[N<sup>8</sup>-Amino-N<sup>2</sup>-(3-methyl-1,2,3,4-tetrahydroquinoline-8-sulfonyl)-L-arginyl]-4-methylpiperidine-2-carboxylic acid.

**• CONTENT OF STEREOISOMERS**

[NOTE—It is recommended to keep all solutions containing argatroban at about 4°.]

**Mobile phase:** Methanol and water (520:480)

**Standard solution:** 0.16 mg/mL of USP Argatroban RS in methanol

**Sample solution:** 0.16 mg/mL of Argatroban in methanol

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 259 nm

**Column:** 4.6-mm × 25-cm; 3-μm packing L1

**Column temperature:** 50°

**Flow rate:** 0.6 mL/min

**Injection volume:** 10 μL

**Run time:** NLT 1.4 times the retention time of (R)-argatroban

**System suitability**

**Sample:** Standard solution

**Suitability requirements**

**Resolution:** NLT 1.2 between (R)-argatroban and (S)-argatroban

**Relative standard deviation:** NMT 2.0% for (R)-argatroban and (S)-argatroban

**Analysis**

**Sample:** Sample solution

Calculate the percentage of (R)-argatroban and (S)-argatroban in the portion of Argatroban taken:

$$\text{Result} = [(r_U \text{ or } r_S)/(r_U + r_S)] \times 100$$

$r_U$  = peak response of (R)-argatroban from the *Sample solution*

$r_S$  = peak response of (S)-argatroban from the *Sample solution*

**Acceptance criteria:** See Table 5.

**Table 5**

Name	Relative Retention Time	Acceptance Criteria, (%)
(R)-Argatroban <sup>a</sup>	1.00	63–67
(S)-Argatroban <sup>b</sup>	1.06	33–37

<sup>a</sup> (2R,4R)-4-Methyl-1-[N<sup>2</sup>-{[(R)-1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]-L-arginyl}]pipercolic acid.

<sup>b</sup> (2R,4R)-4-Methyl-1-[N<sup>2</sup>-{[(S)-1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]-L-arginyl}]pipercolic acid.

**SPECIFIC TESTS**

- **WATER DETERMINATION** (921), *Method Ia*: 3.0%–6.0%
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 2.0 Endotoxin Units/mg of argatroban
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count is NMT 10<sup>2</sup> cfu/g, and the total combined molds and yeasts count is NMT 10<sup>2</sup> cfu/g.

**Arginine**

C<sub>6</sub>H<sub>14</sub>N<sub>4</sub>O<sub>2</sub>

L-Arginine [74-79-3].

174.20

**DEFINITION**

Arginine contains NLT 98.5% and NMT 101.5% of C<sub>6</sub>H<sub>14</sub>N<sub>4</sub>O<sub>2</sub>, as L-arginine, calculated on the dried basis.

**IDENTIFICATION**

- **INFRARED ABSORPTION** (197K)

**ASSAY**

- **PROCEDURE**

**Sample:** 80 mg of Arginine

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Blank:** 3 mL of formic acid and 50 mL of glacial acetic acid

**Analysis:** Dissolve the *Sample* in a mixture of 3 mL of formic acid and 50 mL of glacial acetic acid, and titrate

with Titrant. Calculate the percentage of  $C_6H_{14}N_4O_2$  in the portion taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

- V = Sample titrant volume (mL)  
 B = Blank titrant volume (mL)  
 N = titrant normality (mEq/mL)  
 F = equivalency factor: 87.10 mg/mEq  
 W = weight of Sample (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

## IMPURITIES

### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.3%
- **CHLORIDE AND SULFATE, Chloride** (221): A 1.0-g portion shows no more chloride than corresponds to 0.70 mL of 0.020 N hydrochloric acid (0.05%).
- **CHLORIDE AND SULFATE, Sulfate** (221): A 1.0-g portion shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (0.03%).
- **IRON** (241): NMT 30 ppm

### Delete the following:

- **HEAVY METALS, Method I** (231): NMT 15 ppm (Official 1: Jan-2018)

### Organic Impurities

#### PROCEDURE

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture  
**Standard solution:** 0.05 mg/mL of USP L-Arginine RS in 0.1 N hydrochloric acid. [NOTE—This solution has a concentration equivalent to 0.5% of that of the Sample solution.]  
**Sample solution:** 10 mg/mL of Arginine in 2 N hydrochloric acid  
**System suitability solution:** 0.4 mg/mL each of USP L-Arginine RS and USP L-Lysine Hydrochloride RS in 0.1 N hydrochloric acid  
**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)  
**Application volume:** 5  $\mu$ L  
**Developing solvent system:** Isopropyl alcohol and ammonium hydroxide (7:3)  
**Analysis**

**Samples:** Standard solution, Sample solution, and System suitability solution

Proceed as directed under *Chromatography* (621), *Thin-Layer Chromatography*. Dry the plate between 100° and 105° until the ammonia disappears completely. Spray with *Spray reagent*, and heat between 100° and 105° for about 15 min. Examine the plate under white light. The chromatogram obtained from the *System suitability solution* exhibits two clearly separated spots.

#### Acceptance criteria

**Individual impurities:** Any secondary spot from the *Sample solution* is not larger or more intense than the principal spot from the *Standard solution*, NMT 0.5%  
**Total impurities:** NMT 2.0%

### SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S): +26.3° to +27.7°  
**Sample solution:** 80 mg/mL in 6 N hydrochloric acid
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

## USP REFERENCE STANDARDS (11)

- USP L-Arginine RS
- USP L-Lysine Hydrochloride RS

## Arginine Hydrochloride

$C_6H_{14}N_4O_2 \cdot HCl$  210.66  
 L-Arginine monohydrochloride;  
 L-(+)-Arginine monohydrochloride [1119-34-2].

### DEFINITION

Arginine Hydrochloride contains NLT 98.5% and NMT 101.5% of arginine hydrochloride ( $C_6H_{14}N_4O_2 \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

- CHLORIDE CONTENT**

**Sample:** 350 mg of Arginine Hydrochloride**Titrimetric system**(See *Titrimetry* (541).)**Mode:** Direct titration**Titrant:** 0.1 N silver nitrate VS**Endpoint detection:** Colorimetric

(ERR 1-Apr-2016)

**Analysis:** Transfer the *Sample* to a porcelain casserole, and add 140 mL of water and 1 mL of dichlorofluorescein TS. Mix and titrate with the *Titrant* until the silver chloride flocculates and the mixture acquires a faint pink color.Calculate the percentage of chloride (Cl) in the *Sample* taken:

$$\text{Result} = (V \times N \times F \times 100) / W \quad (\text{ERR 1-Apr-2016})$$

 $V$  = *Sample* titrant volume (mL)

(ERR 1-Apr-2016)

 $N$  = titrant normality (mEq/mL) $F$  = equivalency factor, 35.45 mg/mEq $W$  = weight of *Sample* (mg)**Acceptance criteria:** 16.5%–17.1%**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in well-closed containers.
- USP REFERENCE STANDARDS** (11)  
USP Arginine Hydrochloride RS  
USP L-Lysine Hydrochloride RS

jection. It contains not less than 9.5 percent and not more than 10.5 percent of  $\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2 \cdot \text{HCl}$ . It contains no antimicrobial agents.

**NOTE**—The chloride ion content of Arginine Hydrochloride Injection is approximately 475 mEq per L.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type II glass.

**USP Reference standards** (11)—

USP Arginine Hydrochloride RS

USP Endotoxin RS

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**Identification**—

**A:** Transfer 1 mL of the Injection to a 200-mL volumetric flask, and dilute with water to volume. To 1 mL of this dilution add 2 mL of a solution of 0.02% 8-hydroxyquinoline in 3 N sodium hydroxide, and add 1 mL of 0.1% *N*-bromosuccinimide solution: an orange color is produced.

**B:** It meets the requirements of the tests for *Chloride* (191).

**Bacterial Endotoxins Test** (85)—It contains not more than 0.01 USP Endotoxin Unit per mg of arginine hydrochloride.

**pH** (791): between 5.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* and *Implanted Drug Products* (1).

**Assay**—

**Color reagent**—Dissolve 28.0 g of potassium hydroxide and 2.0 g of potassium sodium tartrate in 100 mL of water. Cool, and add, in the order named, 100 mg of 2,4-dichloro-1-naphthol, 180 mL of alcohol, and 20.0 mL of 0.475% sodium hypochlorite solution. Mix by swirling, and allow to stand at room temperature for 1 hour before using. This *Color reagent* may be stored in a glass-stoppered bottle, in a refrigerator, for 2 months.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Arginine Hydrochloride RS in water, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 40  $\mu$ g per mL.

**Assay preparation**—Pipet into a 100-mL volumetric flask a volume of Injection, equivalent to 200 mg of arginine hydrochloride, add water to volume, and mix. Pipet 5 mL of this solution into a 250-mL volumetric flask, add water to volume, and mix.

**Procedure**—Transfer 2.0-mL portions of the *Assay preparation* and the *Standard preparation*, respectively, to separate flasks, and treat each as follows. Add 2.0 mL of potassium iodide solution (3 in 1000), mix, and allow to stand for 15 minutes. Add 6.0 mL of *Color reagent*, mix, and allow to stand for 15 minutes. Add 2.0 mL of sodium hypochlorite solution (19 in 10,000), mix, and allow to stand for 15 minutes. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 520 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2 \cdot \text{HCl}$  in each mL of the Injection taken by the formula:

$$5(C/V)(A_U/A_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Arginine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the

**Arginine Hydrochloride Injection**

» Arginine Hydrochloride Injection is a sterile solution of Arginine Hydrochloride in Water for In-

absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Aripiprazole

$C_{23}H_{27}Cl_2N_3O_2$  448.39  
2(1*H*)-Quinolinone, 7-[4-[4-(2,3-dichlorophenyl)-1-piperazinyl]butoxy]-3,4-dihydro-;  
7-[4-[4-(2,3-Dichlorophenyl)-1-piperazinyl]butoxy]-3,4-dihydrocarbostyryl [129722-12-9].

### DEFINITION

Aripiprazole contains NLT 98.0% and NMT 102.0% of aripiprazole ( $C_{23}H_{27}Cl_2N_3O_2$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

Protect the solutions from light.

**Diluent:** Acetonitrile, methanol, water, and acetic acid (30:10:60:1)

**Solution A:** Acetonitrile and 0.05% trifluoroacetic acid (10:90)

**Solution B:** Acetonitrile and 0.05% trifluoroacetic acid (90:10)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	80	20
2	80	20
10	65	35
20	10	90
25	10	90
26	80	20
35	80	20

[NOTE—The gradient was established on an HPLC system with a dwell volume of approximately 650  $\mu$ L.]

**System suitability solution:** 1  $\mu$ g/mL each of USP Aripiprazole RS and USP Aripiprazole Related Compound F RS in *Diluent*

**Standard solution:** 0.1 mg/mL of USP Aripiprazole RS in *Diluent*

**Sample solution:** 0.1 mg/mL of Aripiprazole in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

## Aripiprazole Tablets

### DEFINITION

Aripiprazole Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of aripiprazole (C<sub>23</sub>H<sub>27</sub>Cl<sub>2</sub>N<sub>3</sub>O<sub>2</sub>).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Standard:** Add 30 mL of ethyl acetate to 30 mg of USP Aripiprazole RS. Shake for 10 min, centrifuge for NLT 5 min, and pass the supernatant through a suitable membrane filter. To the filtrate add 15 mL of water, shake for 5 min, and centrifuge for NLT 10 min. Transfer 20 mL of the upper layer to a container and add anhydrous magnesium sulfate, as needed. Shake well, pass through a suitable membrane filter, and evaporate the ethyl acetate on a water bath under reduced pressure. Use the residue. [NOTE—A centrifuge speed of 2000 rpm may be suitable.]

**Sample:** Grind a suitable number of Tablets and transfer a suitable portion of the ground Tablets, equivalent to 30 mg of aripiprazole, to an appropriate container. Add 30 mL of ethyl acetate, shake for 10 min, centrifuge for NLT 5 min, and pass the supernatant through a suitable membrane filter. To the filtrate add 15 mL of water, shake for 5 min, and centrifuge for NLT 10 min. Transfer 20 mL of the upper layer to a container and add a suitable amount of anhydrous magnesium sulfate. Shake well, pass through a suitable membrane filter, and evaporate the ethyl acetate on a water bath under reduced pressure. Use the residue. [NOTE—A centrifuge speed of 2000 rpm may be suitable.]

#### Analysis

Samples: *Standard* and *Sample*

Acceptance criteria: Meet the requirements

- **B.** The retention time of the aripiprazole peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### Change to read:

#### • PROCEDURE

**Solution A:** 2.8 g/L of anhydrous sodium sulfate (RB 1, Jun-2016) in water

**Mobile phase:** Acetonitrile, methanol, *Solution A*, and glacial acetic acid (33:11:56:1)

**Internal standard solution:** 0.33 mg/mL of USP Propylparaben RS in *Mobile phase*

**Standard stock solution:** 1 mg/mL of USP Aripiprazole RS in *Mobile phase*

**Standard solution:** 0.2 mg/mL of USP Aripiprazole RS prepared as follows. Transfer 10.0 mL of *Standard stock solution* and 10.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample solution:** Nominally 0.2 mg/mL of aripiprazole from Tablets prepared as follows. Powder NLT 20 Tablets and transfer a suitable portion of the powder to an appropriate volumetric flask. Add 40% of the final flask volume of *Mobile phase* and 20% of the final flask volume of *Internal standard solution*. Shake for 10 min, and dilute with *Mobile phase* to volume. Centrifuge, if necessary, and pass the supernatant through a suitable filter of NMT 0.5-μm pore size, discard the first 1 mL of filtrate, and use the subsequent filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10 μL

**Run time:** NLT 2 times the retention time of aripiprazole

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for aripiprazole and propylparaben are about 1.0 and 1.5, respectively.]

#### Suitability requirements

**Resolution:** NLT 8 between aripiprazole and propylparaben

**Tailing factor:** NMT 1.7 for aripiprazole and for propylparaben

**Relative standard deviation:** NMT 2.0% for the peak response ratio of aripiprazole to propylparaben

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole (C<sub>23</sub>H<sub>27</sub>Cl<sub>2</sub>N<sub>3</sub>O<sub>2</sub>) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of aripiprazole to propylparaben from the *Sample solution*

$R_S$  = peak response ratio of aripiprazole to propylparaben from the *Standard solution*

$C_S$  = concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aripiprazole in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

### PERFORMANCE TESTS

#### • DISSOLUTION (711)

**Medium:** pH 1.2 hydrochloric acid buffer (Transfer 250 mL of 14.9 g/L of potassium chloride in water to a 1-L volumetric flask, add 425 mL of 0.2 N hydrochloric acid.)

ric acid, (RB 1-Jun-2016) and dilute with water to volume. Degas the resulting solution or pass the resulting solution through a filter under vacuum., degassed; 900 mL

Apparatus 2: 60 rpm

Time: 30 min

**Procedure:** Determine the percentage of the labeled amount of aripiprazole ( $C_{23}H_{27}Cl_2N_3O_2$ ) dissolved by using either the *Spectrometric procedure* or the *Chromatographic procedure* described below.

#### Spectrometric procedure

**Standard stock solution:** 1 mg/mL of USP

Aripiprazole RS in alcohol

**Standard solution:** (L/900) mg/mL of USP

Aripiprazole RS from *Standard stock solution* in *Medium*, where L is the label claim, in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter, discarding the first 5 mL of filtrate.

#### Instrumental conditions

**Mode:** UV

**Analytical wavelengths:** 249 and 325 nm

**Cell length:** 1 cm

**Blank:** *Medium*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole ( $C_{23}H_{27}Cl_2N_3O_2$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

$A_U$  = absorbance at 249 nm minus the absorbance at 325 nm of the *Sample solution*

$A_S$  = absorbance at 249 nm minus the absorbance at 325 nm of the *Standard solution*

$C_S$  = concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

#### Chromatographic procedure

**Solution A:** 2.8 g/L of anhydrous sodium sulfate, (RB 1-Jun-2016)

**Solution B:** 13.9 g/L of glacial acetic acid and 23.9 g/L of sodium acetate, (RB 1-Jun-2016) in water

**Mobile phase:** Acetonitrile, methanol, *Solution A*, and glacial acetic acid (40:10:50:1)

**Diluent:** *Solution B* and methanol (50:50)

**Internal standard solution:** 0.67 µg/mL of USP Propylparaben RS in *Diluent*, (RB 1-Jun-2016)

**Standard stock solution A:** 1 mg/mL of USP Aripiprazole RS in *Mobile phase*

**Standard stock solution B:** 0.002 mg/mL of USP Aripiprazole RS from *Standard stock solution A* in *Medium* passed through a suitable filter of NMT 0.5-µm pore size, discarding the first 6 mL of filtrate

**Standard solution:** 0.001 mg/mL of USP Aripiprazole RS from *Standard stock solution B* prepared by combining 5 mL of *Standard stock solution B* and 5 mL of *Internal standard solution*

**Sample stock solution:** Pass a portion of the solution under test through a suitable filter of NMT 0.5-µm pore size, discarding NLT the first 6 mL of filtrate.

**Sample solution:** Combine 2 mL of *Sample stock solution* with 2 mL of *Internal standard solution*.

**Chromatographic system:** Proceed as directed in the Assay except as follows.

**Injection volume:** 100 µL

**Run time:** NLT 2 times the retention time of aripiprazole

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for aripiprazole and propylparaben are about 1.0 and 1.8, respectively.]

#### Suitability requirements

**Resolution:** NLT 10 between aripiprazole and propylparaben

**Relative standard deviation:** NMT 1.5% for the peak response ratio of aripiprazole to propylparaben

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole ( $C_{23}H_{27}Cl_2N_3O_2$ ) dissolved:

$$\text{Result} = (R_U/R_S) \times C_S \times V \times (1/L) \times 100$$

$R_U$  = peak response ratio of aripiprazole to propylparaben from the *Sample solution*

$R_S$  = peak response ratio of aripiprazole to propylparaben from the *Standard solution*

$C_S$  = concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of aripiprazole ( $C_{23}H_{27}Cl_2N_3O_2$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### Change to read:

#### • ORGANIC IMPURITIES

Protect solutions from light.

**Buffer:** 9.6 g/L of dibasic ammonium citrate, 1.6 g/L of citric acid, and 2.9 g/L of sodium dodecyl sulfate, (RB 1-Jun-2016) in water. Adjust with 11 g/L of dibasic ammonium citrate in water, (RB 1-Jun-2016) or 9.6 g/L of anhydrous citric acid in water, (RB 1-Jun-2016) to a pH of 4.7, if needed.

**Mobile phase:** Acetonitrile and *Buffer* (45:55)

**Diluent:** Acetonitrile, water, and glacial acetic acid (40:60:1)

**System suitability solution:** 0.5 mg/mL of USP Aripiprazole RS, and 0.0005 mg/mL each of USP Aripiprazole Related Compound F RS and USP Aripiprazole Related Compound G RS in *Diluent*

**Sample solution:** Nominally 0.5 mg/mL of aripiprazole from Tablets prepared as follows. Powder NLT 20 Tablets, transfer a suitable portion of the powder equivalent to NLT 4 mg of aripiprazole to an appropriate container, and add a suitable volume of *Diluent*. Shake for 10 min and centrifuge, if necessary. Pass the supernatant through a suitable filter of NMT 0.5-µm pore size, discard the first 1 mL of filtrate, and use the subsequent filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**Run time:** NLT 2 times the retention time of aripiprazole

#### System suitability

**Sample:** *System suitability solution*

[NOTE—See *Table 1* for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 3 between aripiprazole related compound G and aripiprazole

**Signal-to-noise ratio:** NLT 10 for aripiprazole related compound F and aripiprazole related compound G

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- $r_U$  = peak response of each degradation product from the *Sample solution*  
 $r_T$  = sum of all the peak responses from the *Sample solution*  
**Acceptance criteria:** See Table 1. • Disregard peaks that are less than 0.1% of the aripiprazole peak. • (RB 1-Jun-2016)

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Aripiprazole related compound F	0.54	0.3 • (RB 1-Jun-2016)
Aripiprazole related compound G	0.81	0.3 • (RB 1-Jun-2016)
Aripiprazole	1.0	—
Any individual unspecified degradation product	—	0.2 • (RB 1-Jun-2016)
Total degradation products	—	1.0

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
  - USP Aripiprazole RS
  - USP Aripiprazole Related Compound F RS
  - 4-(2,3-Dichlorophenyl)-1-[4-(2-oxo-1,2,3,4-tetrahydroquinolin-7-yloxy)butyl]piperazine 1-oxide.  
 $C_{23}H_{27}Cl_2N_3O_3$  464.38
  - USP Aripiprazole Related Compound G RS
  - 7-[4-[4-(2,3-Dichlorophenyl)piperazin-1-yl]butoxy]quinolin-2(1H)-one.  
 $C_{23}H_{25}Cl_2N_3O_2$  446.37
  - USP Propylparaben RS

## Aripiprazole Orally Disintegrating Tablets

**DEFINITION**

Aripiprazole Orally Disintegrating Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of aripiprazole ( $C_{23}H_{27}Cl_2N_3O_2$ ).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197A)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Solution A:** 2.84 g/L of sodium sulfate in water  
**Buffer:** 3.48 g/L of dibasic potassium phosphate adjusted with phosphoric acid to a pH of 8.2  
**Mobile phase:** Acetonitrile and *Buffer* (50:50)  
**Diluent A:** Acetonitrile, methanol, *Solution A*, and glacial acetic acid (33:11:56:1)  
**Diluent B:** Acetonitrile and 0.1 M hydrochloric acid (20:80)  
**System suitability solution:** 0.01 mg/mL each of USP Aripiprazole RS and USP Aripiprazole Related Compound G RS in *Diluent A*. Sonication and shaking may be used to aid in dissolution.  
**Standard solution:** 0.25 mg/mL of USP Aripiprazole RS in *Diluent B*. Sonication may be used to aid in dissolution.  
**Sample solution:** Nominally 0.2–0.3 mg/mL of aripiprazole from NLT 5 Orally Disintegrating Tablets

prepared as follows. Transfer NLT 5 Orally Disintegrating Tablets to a suitable volumetric flask and dilute with *Diluent B* to NMT 75% of the final flask volume. Sonicate for 5 min and shake for 15 min. Dilute with *Diluent B* to volume. Pass the resulting solution through a suitable filter and use the filtrate.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 252 nm

**Column:** 4.6-mm × 10-cm; 3.5-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10 μL

**Run time:** NLT 1.4 times the retention time of aripiprazole

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times of aripiprazole related compound G and aripiprazole are 0.74 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.0 between aripiprazole related compound G and aripiprazole, *System suitability solution*

**Tailing factor:** NMT 1.5, *Standard solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole ( $C_{23}H_{27}Cl_2N_3O_2$ ) in the portion of Orally Disintegrating Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aripiprazole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

• **DISINTEGRATION (701):** NMT 60 s

• **DISSOLUTION (711)**

**Medium:** pH 4.0 sodium acetate trihydrate buffer (3.0 g/L of sodium acetate prepared as follows. Transfer a suitable quantity of sodium acetate to a suitable container containing 90% of the final container volume of water. Adjust with glacial acetic acid to a pH of 4.0. Add water to the final volume.), degassed; 1000 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Mobile phase:** Acetonitrile and 0.025 M hydrochloric acid (40:60)

**Standard solution:** (L/1000) mg/mL of USP Aripiprazole RS in *Mobile phase* where L is the label claim in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter, discarding the first few mL.

**Chromatographic system**

Any individual unspecified degradation product	—	1.0	0.2
Total degradation products	—	—	1.0

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

- **USP REFERENCE STANDARDS (11)**

USP Aripiprazole RS

USP Aripiprazole Related Compound F RS

4-(2,3-Dichlorophenyl)-1-[4-(2-oxo-1,2,3,4-tetrahydroquinolin-7-yloxy)butyl]piperazine 1-oxide.

 $C_{23}H_{27}Cl_2N_3O_3$  464.38

USP Aripiprazole Related Compound G RS

7-[4-[4-(2,3-Dichlorophenyl)piperazin-1-yl]butoxy]quinolin-2(1H)-one.

 $C_{23}H_{25}Cl_2N_3O_2$  446.37**Arsanilic Acid** $C_6H_8AsNO_3$  217.05*p*-Aminobenzenearsonic acid [98-50-0].» Arsanilic Acid contains not less than 98.0 percent and not more than 102.0 percent of  $C_6H_8AsNO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Arsanilic Acid RS

**Identification**, *Infrared Absorption* (197K).

**Loss on drying** (731)—Dry it in vacuum at 80° for 4 hours; it loses not more than 0.5% of its weight.

**Limit of o-arsanilic acid**—

**Mobile phase**—Dissolve 4.04 g of monobasic potassium phosphate in 985 mL of water, add 2 mL of phosphoric acid, and mix. Add 10 mL of methanol, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer about 67 mg of o-arsanilic acid, accurately weighed, to a 100-mL volumetric flask, add about 65 mg of warm (about 70° to 80°) water, and shake or sonicate to dissolve. Allow to cool, dilute with water to volume, and mix. Dilute a portion of this solution quantitatively and stepwise with water to obtain a solution having a known concentration of about 0.0012 mg of o-arsanilic acid per mL.

**Test solution**—Transfer about 50 mg of Arsanilic Acid, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of warm water, and shake or sonicate to dissolve. Allow to cool, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 242-nm detector and a 4.6-mm × 15-cm column that contains 5-μm base-deactivated packing L1 and is maintained at a constant temperature of about 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor, *k'*, for the o-arsanilic acid peak is between 2.8 and 3.8; and the relative standard deviation for replicate injections is not more than 2.5%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the responses for the o-arsanilic acid peaks. Calculate the percentage of o-arsanilic acid in the portion of Arsanilic Acid taken by the formula:

$$5000(C/W)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of o-arsanilic acid in the *Standard solution*; *W* is the weight, in mg, of Arsanilic Acid taken to prepare the *Test solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the responses of the o-arsanilic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.12% is found.

**Limit of aniline**—

**Mobile phase**—Dissolve 7.76 g of monobasic potassium phosphate in 950 mL of water, add 50 mL of methanol, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer about 176 mg of aniline, accurately weighed, to a 25-mL volumetric flask, add about 1 mL of methanol, swirl, then add about 15 mL of water, and shake to dissolve. Dilute with water to volume, and mix. Dilute a portion of this solution quantitatively and stepwise with water to obtain a solution having a known concentration of about 0.00045 mg of aniline per mL.

**Test solution**—Transfer about 50 mg of Arsanilic Acid, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of warm (about 70° to 80°) water, and shake or sonicate to dissolve. Allow to cool, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 235-nm detector

and a 4.6-mm × 15-cm column that contains 5-μm base-deactivated packing L1 and is maintained at a constant temperature of about 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor, *k'*, for the aniline peak is between 2.3 and 3.3; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the responses for the aniline peaks. Calculate the percentage of aniline in the portion of Arsanilic Acid taken by the formula:

$$5000(C/W)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of aniline in the *Standard solution*; *W* is the weight, in mg, of Arsanilic Acid taken to prepare the *Test solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the responses of the aniline peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.045% is found.

**Assay**—Transfer about 125 mg of Arsanilic Acid, accurately weighed, to a 50-mL conical flask, and add 10.0 mL of a mixture of sulfuric acid, nitric acid, and perchloric acid (1000:50:50) and several glass beads. Digest on a hot plate for about 1 hour, increasing the temperature of the hot plate in steps until a ring of sulfuric acid rises into the neck of the flask. Allow to cool, to the colorless solution add about 400 mg of hydrazine sulfate, and heat the flask vigorously on a hot plate until a ring of sulfuric acid rises into the neck of the flask. Allow to cool, and wash down the rim, neck, and insides of the flask with about 1 mL of water. Heat the flask again until a ring of sulfuric acid rises into the neck of the flask. Allow to cool, and transfer the colorless solution, with the aid of about 80 mL of water, to a 125-mL conical flask. Add 10 mL of hydrochloric acid and several drops of 0.002 M potassium iodide, cool to between 0° and 5°, and titrate with 0.1 N potassium permanganate VS to a pale pink endpoint, maintaining the temperature between 0° and 5° during the titration. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N potassium permanganate is equivalent to 10.852 mg of C<sub>6</sub>H<sub>8</sub>AsNO<sub>3</sub>.

## Articaine Hydrochloride

C<sub>13</sub>H<sub>20</sub>N<sub>2</sub>O<sub>3</sub>S · HCl 320.84

2-Thiophenecarboxylic acid, 4-methyl-3-[[1-oxo-2-(propylamino)propyl]amino]-, methyl ester, monohydrochloride;

Methyl 4-methyl-3-[2-(propylamino)propionamido]-2-thiophenecarboxylate, monohydrochloride [23964-57-0].

### DEFINITION

Articaine Hydrochloride contains NLT 98.5% and NMT 101.0% of C<sub>13</sub>H<sub>20</sub>N<sub>2</sub>O<sub>3</sub>S · HCl, calculated on the dried basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197)

**Standard solution:** 12 mg/mL of USP Articaine RS in methylene chloride. Transfer 20 μL of this solution onto a 300-mg disk.

**Sample solution:** Dissolve 100 mg of Articaine Hydrochloride in 5 mL of water. Add 3 mL of a saturated solution of sodium bicarbonate, and shake twice with 2 mL of methylene chloride. Combine the methylene chloride layers, dilute with methylene chloride to 5.0 mL, and dry over anhydrous sodium sulphate. Transfer 20  $\mu$ L of this solution onto a 300-mg disk.

• **B. IDENTIFICATION TESTS—GENERAL, Chloride (191)**

**ASSAY**

• **PROCEDURE**

**Sample solution:** 250 mg of Articaine Hydrochloride to a 250-mL conical flask. Add 5.0 mL of 0.01 M hydrochloric acid and 50 mL of alcohol. Stir to dissolve.

**Analysis:** Titrate with 0.1 M sodium hydroxide VS, determining the endpoint potentiometrically, using a glass electrode. Calculate the volume of sodium hydroxide consumed by reading the volume added between the two points of inflection. Each mL of 0.1 M sodium hydroxide is equivalent to 32.08 mg of  $C_{13}H_{20}N_2O_3S \cdot HCl$ .  
Acceptance criteria: 98.5%–101.0% on the dried basis.

**IMPURITIES**

**Inorganic Impurities**

Delete the following:

• **HEAVY METALS, Method I (231)**

**Sample solution:** 200 mg/mL of Articaine Hydrochloride

Acceptance criteria: NMT 5 ppm (Official 1-Jan-2018)

• **RESIDUE ON IGNITION (281)**

**Sample:** 1 g

Acceptance criteria: NMT 0.1%

**Organic Impurities**

• **PROCEDURE**

**Buffer solution:** 2.02 g of sodium 1-heptanesulfonate and 4.08 g of potassium dihydrogen phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 2.0.

**Mobile phase:** Acetonitrile and Buffer solution (1:3)

**Standard solution:** 2  $\mu$ g/mL of USP Articaine Related Compound A, and 1  $\mu$ g/mL each of USP Articaine Related Compound E RS and USP Articaine Hydrochloride RS in Mobile phase. [NOTE—This solution is also used to determine the reporting threshold limit.]

**Sample solution:** 1.0 mg/mL of Articaine Hydrochloride in Mobile phase

**Chromatographic system**

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 276 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Sample:** Standard solution

**Suitability requirements**

**Resolution:** NLT 1.2 between articaine related compound A and articaine related compound E

**Analysis**

**Samples:** Standard solution and Sample solution.

[NOTE—Run time is 5 times the retention time of articaine.]

Calculate the percentage of any articaine related compound A in the portion of Articaine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of articaine related compound A from the Sample solution

$r_S$  = response of articaine related compound A from the Standard solution

$C_S$  = concentration of USP Articaine Related Compound A RS in the Standard solution (mg/mL)

$C_U$  = concentration of Articaine Hydrochloride in the Sample solution (mg/mL)

Calculate the percentage of each individual impurity in the portion of Articaine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of each individual impurity from the Sample solution

$r_S$  = response of articaine hydrochloride from the Standard solution

$C_S$  = concentration of USP Articaine Hydrochloride RS in the Standard solution (mg/mL)

$C_U$  = concentration of Articaine Hydrochloride in the Sample solution (mg/mL)

[NOTE—Disregard any peak below 0.05%.]

**Acceptance criteria**

**Individual impurities:** See Impurity Table 1.

**Total impurities:** NMT 0.5%. [NOTE—Excluding articaine related compound A.]

## Articaine Hydrochloride and Epinephrine Injection

### DEFINITION

Articaine Hydrochloride and Epinephrine Injection is a sterile solution of Articaine Hydrochloride and Epinephrine, in Water for Injection, and contains NLT 95.0% and NMT 105.0% of the labeled amount of articaine hydrochloride ( $C_{13}H_{20}N_2O_3S \cdot HCl$ ) and NLT 90.0% and NMT 115.0% of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ).

### IDENTIFICATION

- **A.** The retention times of the articaine and epinephrine peaks from the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assays for Articaine Hydrochloride and Epinephrine*, respectively.

### ASSAY

• **ARTICAINE HYDROCHLORIDE**

**Buffer:** Glacial acetic acid and water (50:930). Adjust with 2 N sodium hydroxide to a pH of 3.4.  
**Mobile phase:** Acetonitrile and *Buffer* (22:78)  
**Standard stock solution:** 40 mg/mL of USP Articaine Hydrochloride RS in water  
**Standard solution:** 0.8 mg/mL of USP Articaine Hydrochloride RS in *Mobile phase* from *Standard stock solution*  
**Sample solution:** Equivalent to 0.8 mg/mL of articaine hydrochloride in *Mobile phase* from a portion of Injection  
**Chromatographic system**  
 (See *Chromatography* (621), *System Suitability*).  
**Mode:** LC  
**Detector:** UV 270 nm  
**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1  
**Flow rate:** 1 mL/min  
**Injection size:** 10  $\mu$ L  
**Run time:** 2.5 times the retention time of articaine

#### System suitability

**Sample:** *Standard solution*  
**Suitability requirements**  
**Tailing factor:** NMT 2.2  
**Relative standard deviation:** NMT 1.0%, from six injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of articaine hydrochloride ( $C_{13}H_{20}N_2O_3S \cdot HCl$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Articaine Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of articaine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

• **EPINEPHRINE**

**Mobile phase:** Mix 50 mL of glacial acetic acid and 930 mL of water. Adjust with 2 N sodium hydroxide to a pH of 3.4. In this solution, dissolve 1.2 g of sodium 1-heptanesulfonate, and add 1.0 mL of 0.1 M edetate disodium and 0.298 g of potassium chloride. Add 150 mL of methanol.

**Diluent:** 0.5 mg/mL potassium metabisulfite in water  
**System suitability solution:** 22  $\mu$ g/mL of epinephrine from USP Epinephrine Bitartrate RS and 20  $\mu$ g/mL of norepinephrine from USP Norepinephrine Bitartrate RS in *Diluent*

**Standard stock solution:** 0.55 mg/mL of epinephrine from USP Epinephrine Bitartrate RS in *Diluent*

**Standard solution:** Dilute a suitable volume of the *Standard stock solution* with *Diluent* to obtain a final concentration of  $L$  mg/mL of epinephrine, where  $L$  is the label claim of epinephrine in the Injection.

**Sample solution:** Use the Injection directly.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical

**Reference electrode:** Silver/silver chloride

**Working electrode:** Glassy carbon

**Potential:** +650 mV

**Detector temperature:**  $28 \pm 2^\circ$

**Column:** 4.0-mm  $\times$  25-cm; 5- $\mu$ m packing L7

**Flow rate:** 1 mL/min

**Injection size:** 2  $\mu$ L

**Run time:** 1.7 times the retention time of epinephrine

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for norepinephrine and epinephrine are 0.90 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between the norepinephrine and epinephrine peaks

**Tailing factor:** NMT 2.0 for the epinephrine peak

**Relative standard deviation:** NMT 1.0% for the epinephrine peak, from six injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of epinephrine in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of epinephrine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–115.0%

### PERFORMANCE TESTS

• **DELIVERABLE VOLUME** (698)

For Articaine Hydrochloride and Epinephrine Injection packaged in single-dose containers: Meets the requirements

### IMPURITIES

• **ORGANIC IMPURITIES, LIMIT OF ARTICAINE RELATED COMPOUNDS**

**Mobile phase, Standard stock solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay for Articaine Hydrochloride*.

**Standard solution:** 0.8 mg/mL of USP Articaine Hydrochloride RS from *Standard stock solution* and 40  $\mu$ g/mL of USP Articaine Related Compound B RS in *Mobile phase*

**System suitability****Sample:** *Standard solution*[NOTE—See *Table 1* for relative retention times.]**Suitability requirements****Tailing factor:** NMT 2.2 for the articaïne peak**Resolution:** NLT 1.25 between the articaïne related compound B and articaïne peaks**Relative standard deviation:** NMT 1.0% for the articaïne peak**Analysis****Samples:** *Standard solution* and *Sample solution*

[NOTE—Articaïne related compounds elute at relative retention times of NMT 2.0 with respect to the articaïne peak.]

Calculate the percentage of articaïne related compounds and any other individual impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = response of each individual impurity from the *Sample solution* $r_S$  = response of articaïne from the *Standard solution* $C_S$  = concentration of articaïne in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of articaïne in the *Sample solution* (mg/mL)

[NOTE—Disregard any peak below 0.05%.]

**Acceptance criteria:** See *Table 1*.**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Articaïne related compound B	0.6	0.5
Articaïne	1.0	—
Any other individual impurity	—	0.2
Total impurities	—	0.5

**• ORGANIC IMPURITIES, LIMIT OF EPINEPHRINE RELATED COMPOUNDS**

Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay for Epinephrine.

**Analysis****Samples:** *Standard solution* and *Sample solution*

[NOTE—Epinephrine related compounds elute between relative retention times of 0.35 and 1.0, with respect to the epinephrine peak.]

Calculate the percentage of epinephrine related compounds and any other individual impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = response of each individual impurity from the *Sample solution* $r_S$  = response of epinephrine from the *Standard solution* $C_S$  = concentration of epinephrine in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of epinephrine in the *Sample solution* (mg/mL)**Acceptance criteria:** See *Table 2*.**Table 2**

**Sample solution:** 100 mg/mL in carbon dioxide-free water. Perform the test immediately after preparation of the *Sample solution*.  
**Acceptance criteria:** +20.5° to +21.5°

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Ascorbic Acid RS

## Ascorbic Acid Injection

#### DEFINITION

Ascorbic Acid Injection is a sterile solution, in Water for Injection, of Ascorbic Acid prepared with the aid of Sodium Hydroxide, Sodium Carbonate, or Sodium Bicarbonate. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ).

#### IDENTIFICATION

- **A.**  
**Analysis:** To a volume of Injection, equivalent to 40 mg of ascorbic acid, add 4 mL of 0.1 N hydrochloric acid, then add 4 drops of methylene blue TS, and warm to 40°. **Acceptance criteria:** The deep blue color becomes appreciably lighter or is completely discharged within 3 min.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, obtained as directed in the Assay.

#### Delete the following:

- **C. IDENTIFICATION TESTS—GENERAL, Sodium** (191): Meets the requirements ▲USP40

#### Add the following:

- **C.** The Injection imparts an intense yellow color to a nonluminous flame. ▲USP40

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Dissolve 15.6 g of dibasic sodium phosphate and 12.2 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of  $2.5 \pm 0.05$ .

**Standard solution:** 0.5 mg/mL of USP Ascorbic Acid RS in *Mobile phase*. [NOTE—Refrigerate and store protected from light until use. The solution is stable for at least 24 h. Inject within 3 h after removal from the refrigerator.]

**Sample solution:** Dilute the Injection, if necessary, with *Mobile phase* to obtain a solution with a concentration of about 0.5 mg/mL. [NOTE—Refrigerate and store protected from light until use. The solution is stable for at least 24 h. Inject within 3 h after removal from the refrigerator.]

##### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 245 nm

**Column:** 150-cm  $\times$  6-mm; packing L39

**Flow rate:** 0.6 mL/min

**Injection volume:** 4  $\mu$ L

##### System suitability

**Sample:** *Standard solution*

##### Suitability requirements

**Column efficiency:** NLT 3500 theoretical plates

**Tailing factor:** NMT 1.6

**Relative standard deviation:** NMT 1.5%

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Ascorbic Acid RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of ascorbic acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### IMPURITIES

##### • LIMIT OF OXALATE

**Analysis:** Dilute a volume of Injection, equivalent to 50 mg of ascorbic acid, with water to 5 mL. Add 0.2 mL of acetic acid and 0.5 mL of calcium chloride TS.

**Acceptance criteria:** No turbidity is produced in 1 min.

#### SPECIFIC TESTS

- **PH** (791): 5.5–7.0

- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

- **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 1.2 USP Endotoxin Units/mg of ascorbic acid.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light-resistant, single-dose containers, preferably of Type I or Type II glass.
- **LABELING:** In addition to meeting the requirements in *Labeling* (7), *Labels and Labeling for Injectable Products*, fused-seal containers of the Injection in concentrations of 250 mg/mL and greater are labeled to indicate that since pressure may develop on long storage, precautions should be taken to wrap the container in a protective covering while it is being opened.

USP Endotoxin RS

## Ascorbic Acid Oral Solution

### DEFINITION

Ascorbic Acid Oral Solution is a solution of Ascorbic Acid in a hydroxylic organic solvent or an aqueous mixture thereof. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ).

### IDENTIFICATION

• **A.**

**Sample solution:** A volume of Oral Solution equivalent to 40 mg of ascorbic acid

**Analysis:** To the *Sample solution* add 4 mL of 0.1 N hydrochloric acid, then 4 drops of methylene blue TS, and warm to 40°.

**Acceptance criteria:** The deep blue color becomes appreciably lighter or is completely discharged within 3 min.

• **B.**

**Sample solution:** A volume of Oral Solution equivalent to 20 mg of ascorbic acid

**Analysis:** To the *Sample solution* add 15 mL of trichloroacetic acid solution (1 in 20). Add 200 mg of activated charcoal, shake the mixture vigorously for 1 min, and pass through a small fluted filter, returning the filtrate, if necessary, until clear. To 5 mL of the filtrate add 1 drop of pyrrole, agitate gently until dissolved, then heat in a bath at 50°.

**Acceptance criteria:** A blue color develops.

### ASSAY

• **PROCEDURE**

**Sample solution:** Transfer a volume of Oral Solution equivalent to 50 mg of ascorbic acid, previously diluted with water if necessary, to a 100-mL volumetric flask. Add 20 mL of metaphosphoric-acetic acid TS, dilute with water to volume, and mix.

**Blank:** A mixture of 5.5 mL of metaphosphoric-acetic acid TS and 15 mL of water

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** Standard dichlorophenol-indophenol VS

**Analysis:** Transfer a volume of the *Sample solution*, equivalent to 2 mg of ascorbic acid, into a 50-mL conical flask. Add 5 mL of metaphosphoric-acetic acid TS, and titrate with *Titrant* until a rose-pink color persists for at least 5 s. Correct for the volume of the *Titrant* consumed by the *Blank*.

Calculate the percentage of ascorbic acid ( $C_6H_8O_6$ ) in the portion of Oral Solution taken:

$$\text{Result} = \{[(V_S - V_B) \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample solution* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$F$  = concentration of *Titrant* in terms of its equivalent of ascorbic acid (mg/mL)

$W$  = nominal amount of ascorbic acid taken for *Analysis* (mg)

**Acceptance criteria:** 90.0%–110.0%

### OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I (611)** (if present): 90.0%–110.0% of the labeled content of alcohol ( $C_2H_5OH$ )

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label Oral Solution that contains alcohol to state the alcohol content.

## Ascorbic Acid Tablets

### DEFINITION

Ascorbic Acid Tablets contain ascorbic acid in the form of ascorbic acid ( $C_6H_8O_6$ ), sodium ascorbate ( $C_6H_7NaO_6$ ), calcium ascorbate dihydrate ( $C_{12}H_{14}CaO_{12} \cdot 2H_2O$ ), or their mixture in an amount equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ).

### IDENTIFICATION

• **A.**

**Sample solution:** Triturate a quantity of finely powdered Tablets with diluted alcohol to make a solution of ascorbic acid with a concentration of 20 mg/mL, and filter.

**Analysis:** Add alkaline cupric tartrate TS to a portion of the *Sample solution*.

**Acceptance criteria:** The *Sample solution* reduces alkaline cupric tartrate TS slowly at room temperature but more readily upon heating.

• **B.**

**Sample solution:** Use the *Sample solution* from Identification test A.

**Analysis:** To 2 mL of the *Sample solution* add 4 drops of methylene blue TS, and warm to 40°.

**Acceptance criteria:** The deep blue color of methylene blue becomes appreciably lighter or is completely discharged within 3 min.

• **C.**

**Sample solution:** Use the *Sample solution* from Identification test A.

**Analysis:** To 1 mL of the *Sample solution* add 15 mL of trichloroacetic acid solution (1 in 20) and 200 mg of activated charcoal, shake the mixture vigorously for 1 min, and pass through a small fluted filter, returning the filtrate if necessary, until clear. To 5 mL of the filtrate add 1 drop of pyrrole, agitate gently until dissolved, and then heat in a bath at 50°.

**Acceptance criteria:** A blue color develops.

### ASSAY

[NOTE—Where more than one assay procedure is given in the monograph, the requirements may be met by following any one of the specified procedures, the procedure used being stated in the labeling only if *Procedure 1* is not used.]

• **PROCEDURE 1**

**Sample stock solution:** Transfer NLT 20 Tablets to a 1000-mL volumetric flask containing 250 mL of metaphosphoric-acetic acids TS. Insert the stopper in the flask, and shake by mechanical means for 30 min or until the Tablets have disintegrated completely. Dilute with water to volume.

**Sample solution:** Transfer a portion of the *Sample stock solution* to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Quantitatively dilute the clear supernatant with water, if necessary, to obtain a solution containing 0.5 mg/mL of ascorbic acid.

**Blank:** A mixture of 5.5 mL of metaphosphoric-acetic acids TS and 15 mL of water

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** Standard dichlorophenol-indophenol VS

**Endpoint detection:** Visual, a rose-pink color that persists for at least 5 s

**Analysis:** Transfer a volume of the *Sample solution*, equivalent to 2 mg of ascorbic acid, to a 50-mL conical flask. Add 5 mL of metaphosphoric-acetic acids TS, and titrate with *Titrant*. Correct for the volume of the *Titrant* consumed by the *Blank*.

Calculate the percentage of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ) in the portion of Tablets taken:

$$\text{Result} = [(V_S - V_B) \times F/W] \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample solution* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$F$  = concentration of the *Titrant* in terms of the equivalent of ascorbic acid (mg/mL)

$W$  = nominal weight of ascorbic acid taken for *Analysis* (mg)

**Acceptance criteria:** 90.0%–110.0%

#### PROCEDURE 2

(See *Vitamin C Assay* (580), *Method II—Chromatographic Method*.)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Sample solution:** Withdraw a portion of the solution under test, pass through a suitable filter, and use the pooled sample as the test specimen.

**Analysis:** Proceed as directed in the *Assay, Procedure 1* or *Procedure 2*, conducting the procedure without delay and making any necessary modifications.

Calculate the percentage of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ) dissolved:

For *Procedure 1*

$$\text{Result} = [(V_S - V_B) \times F \times (V_M/a)/L] \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample solution* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$F$  = concentration of the *Titrant* in terms of the equivalent of ascorbic acid (mg/mL)

$V_M$  = volume of *Medium*, 900 mL

$a$  = volume of the aliquot taken for *Analysis*

$L$  = label claim of ascorbic acid (mg/Tablet)

For *Procedure 2*

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

$r_U$  = peak area of ascorbic acid from the *Sample solution*

$r_S$  = peak area of ascorbic acid from the *Standard solution*

$C_S$  = concentration of USP Ascorbic Acid RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ) is dissolved.

##### DISINTEGRATION (701)

[NOTE—Meet this additional test if the label recommends to disintegrate the Tablets in the mouth before swallowing.]

**Medium:** Water

**Time:** NMT 5 min

**Acceptance criteria:** Meet the requirements

##### UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

#### ADDITIONAL REQUIREMENTS

##### PACKAGING AND STORAGE:

Preserve in tight, light-resistant containers.

- LABELING:** The label states the quantity of ascorbic acid in mg/Tablet, and the chemical form of ascorbic acid present in the Tablets. The labeling states with which assay procedure the product complies only if *Procedure 1* is not used. Tablets that are intended to be disintegrated in the mouth before swallowing are so labeled.

##### USP REFERENCE STANDARDS (11)

$C_4H_7NO_4$

133.10

L-Aspartic acid [56-84-8].

#### DEFINITION

Aspartic Acid contains NLT 98.5% and NMT 101.5% of aspartic acid ( $C_4H_7NO_4$ ), calculated on the dried basis.

#### IDENTIFICATION

##### A. INFRARED ABSORPTION (197K)

#### ASSAY

##### PROCEDURE

**Sample:** 100 mg of Aspartic Acid

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N sodium hydroxide VS

**Endpoint detection:** Visual

**Blank:** 50 mL of carbon dioxide-free water. Add 0.1 mL of bromothymol blue TS.

**Analysis:** Transfer the *Sample* to a 125-mL flask, and dissolve in 50 mL of carbon dioxide-free water. Heat slightly if necessary. Cool, add 0.1 mL of bromothymol blue TS, and titrate with *Titrant* until the color changes from yellow to blue. Perform the blank determination. Calculate the percentage of aspartic acid ( $C_4H_7NO_4$ ) in the portion of Aspartic Acid taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

$V$  = *Titrant* volume consumed by the *Sample* (mL)

$B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 133.1 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

#### IMPURITIES

##### RESIDUE ON IGNITION (281):

NMT 0.1%

##### CHLORIDE AND SULFATE, Chloride (221)

**Sample solution:** Dissolve 0.7 g of Aspartic Acid in 10 mL of diluted nitric acid, and dilute with water to 15 mL.

**Acceptance criteria:** The *Sample solution* shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (NMT 0.02%).

##### CHLORIDE AND SULFATE, Sulfate (221)

**Sample solution:** Dissolve 0.8 g of Aspartic Acid in 4 mL of hydrochloric acid, and dilute with water to 15 mL.

**Acceptance criteria:** The *Sample solution* shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid (NMT 0.03%).

- **IRON** (241): NMT 10 ppm

**Delete the following:**

- **HEAVY METALS, Method II** (231): NMT 10 ppm • (Official 1-

Jan-2018)

- **RELATED COMPOUNDS**

**Mobile phase:** 0.008 N sulfuric acid

**System suitability solution:** A mixture of 0.1 mg/mL of USP Fumaric Acid RS, 0.05 mg/mL of USP Maleic Acid RS, and 1.5 mg/mL of USP Malic Acid RS in water

**Fumaric acid standard solution:** 0.1 mg/mL of USP Fumaric Acid RS in water

**Maleic acid standard solution:** 0.05 mg/mL of USP Maleic Acid RS in water

**Malic acid standard solution:** 1.5 mg/mL of USP Malic Acid RS in water

**Sample solution:** Transfer 10 g of Aspartic Acid into a 100-mL volumetric flask, add 50 mL of water and, if necessary, a few drops of 6 N hydrochloric acid to help dissolve the sample. Dilute with water to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 7.8-mm × 30-cm; 9-μm packing L17

**Column temperature:** 30°

**Flow rate:** 0.6 mL/min

**Injection volume:** 10 μL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—See *Table 1* for the relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between maleic acid and malic acid

**Relative standard deviation:** NMT 10.0% each for maleic acid, malic acid, and fumaric acid

**Analysis**

**Samples:** Standard solutions and *Sample solution*

Calculate the percentage of each specified acid in the portion of Aspartic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of maleic acid, malic acid, or fumaric acid from the *Sample solution*

$r_S$  = peak response of maleic acid, malic acid, or fumaric acid from the corresponding Standard solution

$C_S$  = concentration of USP Maleic Acid RS, USP Malic Acid RS, or USP Fumaric Acid RS in the corresponding Standard solution (mg/mL)

$C_U$  = concentration of Aspartic Acid in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Aspartic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any unspecified impurity from the *Sample solution*

$r_S$  = peak response of fumaric acid from the *Fumaric acid standard solution*

$C_S$  = concentration of USP Fumaric Acid RS in the *Fumaric acid standard solution* (mg/mL)

$C_U$  = concentration of Aspartic Acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Maleic acid	0.5	0.05
Malic acid	0.6	0.20
Fumaric acid	1.0	0.10
Aspartic acid	Not observed	—
Any unspecified impurity	—	0.05
Total unspecified impurities	—	0.10

**SPECIFIC TESTS**

- **OPTICAL ROTATION, Specific Rotation** (781S)

**Sample solution:** 80 mg/mL in 6 N hydrochloric acid

**Acceptance criteria:** +24.0° to +26.0°, at 20°

- **LOSS ON DRYING** (731)

**Analysis:** Dry at 105° for 3 h.

**Acceptance criteria:** NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store protected from light.

- **USP REFERENCE STANDARDS** (11)

USP Aspartic Acid RS

USP Fumaric Acid RS

USP Maleic Acid RS

USP Malic Acid RS

## Aspirin

$C_9H_8O_4$  180.16

Benzoic acid, 2-(acetyloxy)-.

Salicylic acid acetate [50-78-2].

» Aspirin contains not less than 99.5 percent and not more than 100.5 percent of  $C_9H_8O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aspirin RS

**Identification**—

**A:** Heat it with water for several minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

**B:** *Infrared Absorption* (197K).

**Loss on drying** (731)—Dry it over silica gel for 5 hours: it loses not more than 0.5% of its weight.

**Readily carbonizable substances** (271)—Dissolve 500 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid Q*.

**Residue on ignition** (281): not more than 0.05%.

**Substances insoluble in sodium carbonate TS**—A solution of 500 mg in 10 mL of warm sodium carbonate TS is clear.

**Chloride** (221)—Boil 1.5 g with 75 mL of water for 5 minutes, cool, add sufficient water to restore the original volume, and filter. A 25-mL portion of the filtrate shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.014%).

**Sulfate**—Dissolve 6.0 g in 37 mL of acetone, and add 3 mL of water. Titrate potentiometrically with 0.02 M lead perchlorate, prepared by dissolving 9.20 g of lead perchlorate in water to make 1000 mL of solution, using a pH meter capable of a minimum reproducibility of  $\pm 0.1$  mV (see *pH* (791)) and equipped with an electrode system consisting of a lead-specific electrode and a silver-silver chloride reference glass-sleeved electrode containing a solution of tetraethylammonium perchlorate in glacial acetic acid (1 in 44) (see *Titrimetry* (541)); not more than 1.25 mL of 0.02 M lead perchlorate is consumed (0.04%). [NOTE—After use, rinse the lead-specific electrode with water, drain the reference electrode, flush with water, rinse with methanol, and allow to dry.]

#### Delete the following:

**•Heavy metals**—Dissolve 2 g in 25 mL of acetone, and add 1 mL of water. Add 1.2 mL of thioacetamide-glycerin base TS and 2 mL of pH 3.5 Acetate Buffer (see *Heavy Metals* (231)), and allow to stand for 5 minutes: any color produced is not darker than that of a control made with 25 mL of acetone and 2 mL of *Standard Lead Solution* (see *Heavy Metals* (231)), treated in the same manner. The limit is 10  $\mu$ g per g. • (Official 1-Jan-2018)

**Limit of free salicylic acid**—Dissolve 2.5 g in sufficient alcohol to make 25.0 mL. To each of two matched color-comparison tubes add 48 mL of water and 1 mL of a freshly prepared, diluted ferric ammonium sulfate solution (prepared by adding 1 mL of 1 N hydrochloric acid to 2 mL of ferric ammonium sulfate TS and diluting with water to 100 mL). Into one tube pipet 1 mL of a standard solution of salicylic acid in water, containing 0.10 mg of salicylic acid per mL. Into the second tube pipet 1 mL of the 1 in 10 solution of Aspirin. Mix the contents of each tube: after 30 seconds, the color in the second tube is not more intense than that in the tube containing the salicylic acid (0.1%).

**Assay**—Place about 1.5 g of Aspirin, accurately weighed, in a flask, add 50.0 mL of 0.5 N sodium hydroxide VS, and boil the mixture gently for 10 minutes. Add phenolphthalein TS, and titrate the excess sodium hydroxide with 0.5 N sulfuric acid VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.5 N sodium hydroxide is equivalent to 45.04 mg of  $C_9H_8O_4$ .

## Aspirin Boluses

» Aspirin Boluses contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label Boluses to indicate that they are for veterinary use only.

#### USP Reference standards (11)—

USP Aspirin RS

USP Salicylic Acid RS

#### Identification—

**A:** Crush 1 Bolus, boil a portion of the powder, equivalent to about 300 mg of aspirin, with 50 mL of water, cool, and add a drop of ferric chloride TS: a violet-red color is produced.

**B:** The retention time of the aspirin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

*Medium:* 0.5 M phosphate buffer, pH 7.4; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 45 minutes.

*Diluting solution*—Prepare a mixture of acetonitrile and formic acid (99:1).

*Procedure*—Determine the amount of aspirin ( $C_9H_8O_4$ ) dissolved by employing UV absorption at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm on filtered portions of the solution under test, suitably diluted with *Diluting solution*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use.]

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of salicylic acid**—Using the chromatograms of the *Standard preparation* and the *Assay preparation*, obtained as directed in the *Assay*, calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Boluses taken by the formula:

$$100,000(C/W_A)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*;  $W_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Boluses taken, as determined in the *Assay*; and  $r_U$  and  $r_S$  are the salicylic acid peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 0.3% is found.

#### Assay—

*Mobile phase*—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4. Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)).

*Diluting solution*—Prepare a mixture of acetonitrile and formic acid (99:1).

*Standard preparation*—Prepare a solution in *Diluting solution* having known concentrations of about 0.4 mg of USP Aspirin RS and 0.01 mg of USP Salicylic Acid RS per mL.

*Assay preparation*—Weigh and finely powder not fewer than 10 Boluses. Transfer an accurately weighed portion of the powder, equivalent to about 400 mg of aspirin, to a 100-mL volumetric flask, dilute with *Diluting solution* to volume, and stir by mechanical means for about 15 minutes. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for salicylic acid and 1.0 for aspirin, and the relative standard deviation of the aspirin peak response for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Boluses taken by the formula:

$$1000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the

aspirin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Capsules

» Aspirin Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

NOTE—Capsules that are enteric-coated or the contents of which are enteric-coated meet the requirements for *Aspirin Delayed-Release Capsules*.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aspirin RS

**Identification**—

**A:** Heat about 100 mg of the Capsule contents with 10 mL of water for several minutes, cool, and add 1 drop of ferric chloride TS: a violet-red color is produced.

**B:** Shake a quantity of the contents of Capsules, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour: the residue responds to *Identification test B* under *Aspirin*.

**Dissolution** (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 500 mL.

**Apparatus 1:** 100 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved from UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to bring the Reference Standard into solution prior to dilution with *Medium*.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—

**Ferric chloride-urea reagent**—Dissolve by swirling, without the aid of heat, 60 g of urea in a mixture of 8 mL of ferric chloride solution (6 in 10) and 42 mL of 0.05 N hydrochloric acid. Adjust the resulting solution, if necessary, with 6 N hydrochloric acid to a pH of 3.2.

**Standard preparation**—Transfer 75.0 mg of salicylic acid, previously dried over silica gel for 3 hours and accurately weighed, to a 100-mL volumetric flask, add chloroform to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with chloroform to volume, and mix. Transfer 10.0 mL of this last solution to a 50-mL volumetric flask containing 10 mL of methanol, 2 drops of hydrochloric acid, and 10 mL of a 1 in 10 solution of glacial acetic acid in ether, dilute with chloroform to volume, and mix.

**Chromatographic column** (see *Chromatography* (621))—Proceed as directed under *Column Partition Chromatography*, packing a chromatographic tube with two segments of packing material. The lower segment is a mixture of 1 g of *Solid Support* and 0.5 mL of 5 M phosphoric acid, and the upper segment is a mixture of 3 g of *Solid Support* and 2 mL of freshly prepared *Ferric chloride-urea reagent*.

**Test preparation**—Weigh accurately a portion of the contents of the Capsules, as determined by the *Assay*, equivalent to 100 mg of aspirin, mix with 10 mL of chloroform by stirring for 3 minutes, and then transfer to the chromatographic column with the aid of a few mL of chloroform. Pass 50 mL of chloroform through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. Prepare as a receiver a 50-mL volumetric flask containing 10 mL of methanol and 2 drops of hydrochloric acid, and elute any salicylic acid from the column by passing 10 mL of a 1 in 10 solution of glacial acetic acid in ether that has been recently saturated with water, followed by 30 mL of chloroform. Dilute the eluate with chloroform to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 306 nm, with a suitable spectrophotometer, using as the blank a solvent mixture of the same composition as that used for the *Standard preparation*: the absorbance of the *Test preparation* does not exceed that of the *Standard preparation* (0.75%, calculated on the labeled aspirin content).

**Assay**—[NOTE—In this assay use chloroform recently saturated with water.]

**Standard preparation**—Transfer about 50 mg of USP Aspirin RS, accurately weighed, to a 50-mL volumetric flask, add 0.5 mL of glacial acetic acid, add chloroform to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with a 1 in 100 solution of glacial acetic acid in chloroform to volume, and mix. The concentration of USP Aspirin RS is about 50 µg per mL.

**Chromatographic column**—Proceed as directed under *Column Partition Chromatography* (see *Chromatography* (621)), packing a chromatographic tube with a mixture of 3 g of *Solid Support* and 2 mL of freshly prepared sodium bicarbonate solution (1 in 12).

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of aspirin, to a 50-mL volumetric flask containing 1 mL of a 1 in 50 solution of hydrochloric acid in methanol, add chloroform to volume, and mix. Transfer 5.0 mL of this solution to the column, wash with 5 mL and then with 25 mL of chloroform, and discard the washings. Elute into a 100-mL volumetric flask with about 10 mL of a 1 in 10 solution of glacial acetic acid in chloroform and then with about 85 mL of a 1 in 100 solution of glacial acetic acid in chloroform, dilute with the latter solvent to volume, and mix.

**Procedure**—Without delay, concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Capsules taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Aspirin RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Delayed-Release Capsules

» Aspirin Delayed-Release Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label indicates that the Capsules or the contents thereof are enteric-coated.

**USP Reference standards** (11)—

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—

**A:** Heat about 100 mg of the Capsule contents with 10 mL of water for several minutes, cool, and add 1 drop of ferric chloride TS: a violet-red color is produced.

**B: Infrared Absorption** (197K)—Prepare the test specimen as follows. Shake a quantity of the contents of Capsules, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour.

**Dissolution** (711)—Proceed as directed for *Procedure* for *Method A* under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

*Apparatus 1:* 100 rpm.

*Time:* 90 minutes, for *Buffer stage*.

**Diluent**—Prepare a mixture of 0.1 N hydrochloric acid and 0.20 M tribasic sodium phosphate (3:1), and adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of  $6.8 \pm 0.05$ .

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved by determining UV absorbances at the wavelength of the isobestic point of aspirin and salicylic acid (about 280 nm in the *Acid stage*, and about 265 nm in the *Buffer stage*), using a filtered portion of the solution under test, diluted, if necessary, with 0.1 N hydrochloric acid (analyzing the *Acid stage*) and with *Diluent* (analyzing the *Buffer stage*), in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same medium.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—

**Mobile phase and Diluting solution**—Prepare as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation*, prepared as directed in the *Assay*, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

**Test solution**—Use the *Stock solution* prepared as directed for *Assay preparation*.

**Chromatographic system**—Use the *Chromatographic system* described in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure* in the *Assay*: the relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin; the resolution, *R*, between salicylic acid and aspirin is not less than 2.0; and the relative standard deviation of the salicylic acid peak responses is not more than 4.0%.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Capsules taken by the formula:

$$2000(C / Q_A)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*; *Q<sub>A</sub>* is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Capsules taken, as determined in the *Assay*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the salicylic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

**Assay**—

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 glass beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for *Limit of free salicylic acid*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not greater than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Capsules taken by the formula:

$$200C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the aspirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Suppositories

» Aspirin Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in well-closed containers, in a cool place.

**USP Reference standards** (11)—

USP Aspirin RS

**Identification**—Transfer a portion of the melted Suppositories obtained in the *Assay*, equivalent to about 1 g of aspirin, to a 125-mL conical flask. Add 20 mL of alcohol, and

warm until completely disintegrated. Cool in an ice bath for 5 minutes, filter, and evaporate the filtrate to dryness: the residue responds to *Identification* tests A and B under *Aspirin*.

#### Limit of free salicylic acid—

**Ferric chloride-urea reagent**—To a mixture of 8 mL of ferric chloride solution (6 in 10) and 42 mL of 0.05 N hydrochloric acid add 60 g of urea. Dissolve the urea by swirling and without the aid of heat, and adjust the resulting solution, if necessary, by the addition of 6 N hydrochloric acid to a pH of 3.2. Prepare on the day of use.

**Procedure**—Insert a small pledget of glass wool above the stem constriction of a 20- × 2.5-cm chromatographic tube, and uniformly pack with a mixture of about 1 g of chromatographic siliceous earth and 0.5 mL of 5 M phosphoric acid. Directly above this layer, pack a similar mixture of about 3 g of chromatographic siliceous earth and 2 mL of *Ferric chloride-urea reagent*. Transfer to a small beaker an accurately weighed portion of the cooled mass from the previously melted Suppositories obtained in the *Assay*, equivalent to 50 mg of aspirin, add 10 mL of chloroform, warm slightly, and stir until dissolved. With the aid of 5 mL of chloroform, transfer the mixture to the chromatographic adsorption column. Pass 50 mL of chloroform in several portions through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. If the purple zone reaches the bottom of the tube, discard the column, and repeat the test with a smaller quantity of melted Suppositories.

Elute the adsorbed salicylic acid into a 100-mL volumetric flask containing 20 mL of methanol and 0.2 mL of hydrochloric acid by passing two 10-mL portions of a 1 in 10 solution of glacial acetic acid in water-saturated ether, and then 30 mL of chloroform, through the column, and dilute the eluate with chloroform to volume. Dissolve a suitable, accurately weighed quantity of salicylic acid in chloroform to obtain a Standard solution containing 150 µg of salicylic acid per mL. Pipet 5 mL of this solution into a 50-mL volumetric flask containing 10 mL of methanol, 0.1 mL of hydrochloric acid, and 10 mL of a 1 in 10 solution of glacial acetic acid in ether. Add chloroform to volume, and mix. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 306 nm, using as the blank a solvent mixture of the same composition as that of the Standard solution: the absorbance of the solution from the Suppositories does not exceed that of the Standard solution (3.0%).

**Assay**—[NOTE—In this assay, use chloroform that recently was saturated with water.]

**Chromatographic column**—Uniformly pack a chromatographic tube, as described in the test for *Limit of free salicylic acid* for *Procedure*, with a mixture of about 3 g of chromatographic siliceous earth and 2 mL of sodium bicarbonate solution (1 in 12) prepared on the day of use.

**Standard preparation**—Transfer about 50 mg of USP Aspirin RS, accurately weighed, to a 50-mL volumetric flask, add 0.5 mL of glacial acetic acid, and add chloroform to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add a 1 in 100 solution of glacial acetic acid in chloroform to volume, and mix.

**Assay preparation**—Tare a small dish and glass rod, place in the dish not fewer than 5 Suppositories, heat gently on a steam bath until melted, then stir, cool while stirring, and weigh. Transfer an accurately weighed portion of the mass, equivalent to about 50 mg of aspirin, to a 50-mL volumetric flask containing 1 mL of a 1 in 50 solution of hydrochloric acid in methanol, add 40 mL of chloroform, mix, and add chloroform to volume.

**Procedure**—Pipet 5 mL of the *Assay preparation* into the column, wash with 5 mL and then with 25 mL of chloroform, and discard the washings. Without delay, elute into a 100-mL volumetric flask with about 10 mL of a 1 in 10 solution of glacial acetic acid in chloroform, and then with about 85 mL of a 1 in 100 solution of glacial acetic acid in

chloroform, dilute with the latter solvent to volume, and mix. Without delay, concomitantly determine the absorbances of the eluted *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Suppositories taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Aspirin RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Tablets

» Aspirin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ). Tablets of larger than 81-mg size contain no sweeteners or other flavors.

NOTE—Tablets that are enteric-coated meet the requirements for *Aspirin Delayed-Release Tablets*.

**Packaging and storage**—Preserve in tight containers. Preserve flavored or sweetened Tablets of 81-mg size or smaller in containers holding not more than 36 Tablets each.

#### USP Reference standards (11)—

USP Aspirin RS

USP Salicylic Acid RS

#### Identification—

**A:** Crush 1 Tablet, boil it with 50 mL of water for 5 minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

**B: Infrared Absorption** (197K)—Prepare the test specimen as follows. Shake a quantity of finely powdered Tablets, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant, and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour.

#### Dissolution (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 500 mL.

**Apparatus 1:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved from UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to bring the Reference Standard into solution prior to dilution with *Medium*.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Limit of free salicylic acid—

**Mobile phase and Diluting solution**—Prepare as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation* prepared as directed in the *Assay*, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

**Test solution**—Use the *Stock solution* prepared as directed for *Assay preparation* in the *Assay*.

**Chromatographic system**—Use the *Chromatographic system* described in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin; the resolution,  $R$ , between salicylic acid and aspirin is not less than 2.0; and the relative standard deviation of the salicylic acid peak responses is not more than 4.0%.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Tablets taken by the formula:

$$2000(C / Q_A)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*;  $Q_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken, as determined in the *Assay*, and  $r_U$  and  $r_S$  are the peak responses of the salicylic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.3% is found. In the case of Tablets that are coated, not more than 3.0% is found.

#### Assay—

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for *Limit of free salicylic acid*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm  $\times$  30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not greater than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the aspirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Buffered Aspirin Tablets

» Buffered Aspirin Tablets contain Aspirin and suitable buffering agents. Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Aspirin RS

USP Salicylic Acid RS

#### Identification—

**A:** Crush 1 Tablet, boil it with 50 mL of water for 5 minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

**B:** *Infrared Absorption* (197K)—

**Test specimen**—Shake a quantity of finely powdered Tablets, equivalent to about 500 mg of aspirin, with 10 mL of chloroform for several minutes. Centrifuge the mixture. Pour off the clear supernatant, and evaporate it to dryness.

#### Dissolution (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 500 mL.

**Apparatus 2:** 75 rpm. [NOTE—Where the Tablet is composed of multiple layers, a stainless steel wire helix may be used, if needed, to hold the Tablet in proper orientation in the apparatus.]

**Time:** 30 minutes.

**Procedure**—Determine the amount of aspirin ( $C_9H_8O_4$ ) dissolved by employing UV absorption at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the *Standard solution* at the time of use. An amount of methanol not to exceed 1% of the total volume of the *Standard solution* may be used to dissolve the Reference Standard prior to dilution with *Medium*.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Acid-neutralizing capacity** (301): not less than 1.9 mEq of acid is consumed for each 325 mg of aspirin in the Tablets.

#### Limit of free salicylic acid—

**Mobile phase and Diluting solution**—Prepare as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation* prepared as directed in the *Assay*, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

**Test solution**—Use the *Stock solution*, prepared as directed for *Assay preparation* in the *Assay*.

**Chromatographic system**—Prepare as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin; the resolution,  $R$ , between salicylic acid and aspirin is not less than 2.0; and the relative standard deviation determined from salicylic acid is not more than 4.0%.

**Procedure**—Proceed as directed in the Assay. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Tablets taken by the formula:

$$2000(C / Q_A)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*;  $Q_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken, as determined in the Assay; and  $r_U$  and  $r_S$  are the peak responses of salicylic acid obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

#### Assay—

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 glass beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for Limit of free salicylic acid.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of aspirin obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Delayed-Release Tablets

### DEFINITION

Aspirin Delayed-Release Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of aspirin ( $C_9H_8O_4$ ).

### IDENTIFICATION

#### • A. PROCEDURE

**Sample:** 1 Tablet

**Analysis:** Crush and boil the *Sample* with 50 mL of water for 5 min, cool, and add 1 or 2 drops of ferric chloride TS.

**Acceptance criteria:** A violet-red color is produced.

#### • B. INFRARED ABSORPTION (197K)

**Sample:** Shake a quantity of finely powdered Tablets, equivalent to 500 mg of aspirin, with 10 mL of alcohol
